

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CONCLUDING NOTICE.

THE design of this work, as explained in the Notice prefixed to the first volume, is that of a **DICTIONARY OF UNIVERSAL KNOWLEDGE FOR THE PEOPLE**—not a mere collection of elaborate treatises in alphabetic order, but a work to be readily consulted as a **DICTIONARY** on every subject on which people generally require some distinct information—no article being longer than was absolutely necessary. Commenced in 1859, the work is now brought to a close in 1868, and the Editors confidently point to the Ten volumes of which it is composed, as forming the most **COMPREHENSIVE**—as it certainly is the **CHEAPEST**—**ENCYCLOPÆDIA** ever issued in the United Kingdom.

The original plan, as exemplified in the first volume, has been strictly adhered to throughout; and if, as the work proceeded, there has been any change in the method or quality of the execution, it may at least be affirmed that the change has not been for the worse. After some experience, it became easier to find the person specially qualified to write a particular kind of article, and thus the circle of contributors became widened, and the distribution of the work more specialised. It was also seen to be desirable, in regard to certain classes of subjects, to admit a rather ampler selection of heads. This has been effected without increasing the scale of the work, not so much by less full treatment of the subjects, as by increased care in condensing the statements and omitting everything superfluous.

It will be observed that in the earlier volumes there are fewer notices of *places* than in the later. These and other deficiencies in the Geographical department, have, as far as possible, been remedied in the **SUPPLEMENT**; so that the **ENCYCLOPÆDIA** forms a complete Gazetteer. The minuteness of a special geographical dictionary is, of course, not to be expected: with regard to towns, for instance, it may be well to state, in order to prevent disappointment, that, as a rule, no place with a population under 3000 in the United Kingdom, or under 5000 in other parts of the world, need be looked for under its own name, unless it be historically or otherwise noteworthy. But towns, rivers, &c. of secondary importance mentioned anywhere in the work find a place in the **Index**, and thus a clue is given to some information regarding them, were it only their whereabouts on the map.

In like manner, in the department of Biography, the limited scale of the work made it necessary to exclude many names which would be deserving of record in an exhaustive biographical dictionary. The intention has been to include only the more prominent actors and thinkers, dead and living, especially such as have attained extensive celebrity. The difficulty of making such a selection is known only to those who have tried it; and

the Editors were prepared to have the judiciousness of their choice frequently questioned. In settling relative claims to distinction, the judgment depends much on the special pursuits or sphere of thought of the judge. Of the omitted names to which attention has been kindly called by correspondents, several have, on reconsideration, been introduced into the SUPPLEMENT.

Natural History has been copiously treated. Without any attempt at embracing a complete exhibition of the three kingdoms of nature, the aim has been to give some account of every class of objects having a general interest, more especially such as are in any way of use in the economy of life.

The articles descriptive of the structure and functions of the human body have been selected and treated mainly with a view to illustrate the laws of health. The subject of Health and Disease has received more attention relatively than is usual in such works; and the articles of this class will form a pretty complete Dictionary of Domestic Medicine. How important it is that some knowledge on these matters should be widely diffused, is becoming more and more recognised. The directions given in regard to treatment are chiefly meant for those cases of sudden illness or injury where lay practice is necessitated by the absence of professional assistance. But prevention is better than cure; and the chief advantage of a generally diffused knowledge of the nature and causes of diseases is, that it teaches people how to avoid them. A review of what has been done in recent years for the preservation of the health of communities, is given at some length in the SUPPLEMENT, under the head of SANITARY SCIENCE.

Of the Sciences, the least adapted to encyclopædic treatment is Mathematics. All terms of common occurrence, however, have been introduced, and a brief exposition of the subjects given, so far as could be done in an elementary way.

Natural Philosophy has received ample attention, and all the leading doctrines and facts of general interest will be found under their appropriate heads, treated in a popular way and divested as far as possible of the technicalities of mathematics.

Chemistry, some knowledge of which is becoming daily more indispensable in all departments of life, receives a comparatively large space. Prominence has been given to those points of the subject that have either a direct practical bearing or a special scientific interest. During the progress of the work, several changes in the nomenclature and notation of the science have come into general use; but it was thought better to preserve uniformity in the use of terms and symbols to the end, and to give an account of the changes in the SUPPLEMENT.

A distinctive feature of this ENCYCLOPÆDIA, it is believed, will be found to lie in the number of articles devoted to religious beliefs and speculative opinions, and in the way in which these topics are handled. The principle followed has been, not to pronounce an opinion for or against a particular doctrine, but to give a true and unprejudiced account of it. To do this, however, in regard to matters of still living controversy, on which almost every one has more or less of a personal feeling, is next to impossible; and therefore the plan has been adopted of giving the opposing views, wherever it was

practicable, as stated by their respective adherents. Thus, the articles on the doctrines and rites of the Roman Catholic Church are written by a Roman Catholic scholar; the Unitarian scheme of doctrine by a Unitarian; and the Secularists have been allowed to state their own case. In carrying out this principle, it has sometimes been necessary to employ two writers on one article. The account of the REFORMATION, for instance, is naturally written by a Protestant; but our conception of the movement is not complete until we know how the same events are looked upon by intelligent adherents of the Church of Rome; and accordingly, a paragraph is added written from the Roman Catholic point of view. Similarly, in the article BISHOP, the Episcopal and Presbyterian theories of the origin and nature of that office are from different pens. The principle of getting an account of a system or doctrine from a believer in it has not been confined to religion; it has been acted on in regard to HOMŌPATHY, HYDROPATHY, and many other subjects. The Editors feel confident that in thus securing the most favourable representation of both sides of a controversy, they were doing the best in their power for the ultimate prevalence of the truth. We are not in a position to judge rightly between two opinions until we know exactly what they are; and this we can do only by having both before us in the light in which they appear to those that hold them.

The great world of thought of the East, with its hundreds of millions of subtle intellects and prolific imaginations, has remained hitherto almost a sealed book in the West, except to a few oriental scholars. Yet the British public might be expected to feel some interest in inquiring what kind of thoughts and fancies actuate the vast multitudes of their fellow-subjects in Hindustan—what gods they worship, and with what rites; what things seem good to them, and what evil; how, in short, they interpret the riddle of this world, and the part they play in it. The means of gratifying this curiosity is now made more generally accessible than it has heretofore been, by the numerous articles, drawn from original sources, on the religious and philosophic systems of India. (See the articles INDIA, section on *Religion*; PURĀN'A, VEDA, VIŠHNU, VEDĀNTA, TRANSMIGRATION, BUDDHISM, LAMAIISM, NIRVĀNA, &c.) Attention is also called to the original articles on Mohammedanism, and on its various schools, sects, and heresies (see MOHAMMEDANISM, KORAN, SUNNA, SHIITES, and others in the ENCYCLOPŒDIA proper, and particularly the articles MOHAMMEDAN SECTS, MOTAZALITES, ISMAILIS, SINCERE BRETHREN, &c. in the SUPPLEMENT). The reader who has been accustomed to think of the Old Testament Scriptures as the whole of Hebrew literature, will be able, from the articles on the TALMUD, HAGGADA, HALACHA, EŠSENES, and others, to form some notion of the rich treasures of Jewish thought and learning that lie buried in the Talmudic writings and have only recently begun to attract attention.

True to its projected plan as a DICTIONARY OF UNIVERSAL KNOWLEDGE FOR THE PEOPLE, CHAMBERS'S ENCYCLOPŒDIA will be found to be especially rich in notices of miscellaneous matters. Some of the subjects introduced might perhaps be considered beneath the dignity of a book aspiring to a more severely scientific character; but all of them are, if not instructive, at least curious or entertaining, and likely to occur in the course of reading or conversation. During the progress of the work, the Editors have received numerous assurances from parents how highly it was prized, even though only partly issued, in households with young people at school, as a repertory of the kind of things they are constantly in search of and often puzzling their elders about. This use of the

ENCYCLOPÆDIA has been steadily kept in view; and it is gratifying to learn that it is found efficiently to serve the purpose intended. The numerous wood-cuts and maps will, it is hoped, enhance its value in this respect.

To meet the more important of the changes that have taken place since the publication of the ENCYCLOPÆDIA began, as well as to remedy some deficiencies, a SUPPLEMENT of 409 pages has been added. It consists of: (1) Subjects that have only recently risen into importance, or that had been overlooked; (2) Subjects already noticed in the body of the work, but which have since undergone important changes, or, from other causes, seemed to require to be treated anew.

In the introductory Notice, it was stated that the plan of the work was contrived with a special view to render it *easy of consultation*. This end will be still further served by the INDEX of subordinate subjects at the end of this volume. Prefixed to the Index is a paragraph explaining its nature and use.

That in a work extending to 8320 pages, and consisting of upwards of 27,000 distinct articles, in the production of which more than a hundred writers have taken greater or less part—that in such a work, notwithstanding all vigilance to the contrary, there should be not a few oversights, errors, and inconsistencies, is a matter of course. Yet, in spite of such inevitable blemishes, the Editors feel confident that, in substantial accuracy and trustworthiness, this ENCYCLOPÆDIA will bear comparison with any book of the kind. To the numerous correspondents who have favoured them by pointing out faults, or making other suggestions, they beg leave, once for all, to return their best thanks for the uniform courtesy with which their criticisms have been offered. Some of the complaints of omission have been attended to in the SUPPLEMENT; others proceeded on mistaken ideas as to what the ENCYCLOPÆDIA was intended for.

A list of the chief Contributors is given on a subsequent page. To this able staff, to whose special knowledge of their subjects the ENCYCLOPÆDIA owes its chief value, the Editors have to express their acknowledgments, and to thank them for the patience with which they have submitted to the limits as to space and other trammels incident to the nature of the publication, which often rendered the satisfactory treatment of their subjects extremely difficult. The list does not include the numerous friends to whom the Editors are indebted for single contributions on local or other matters coming within their personal knowledge.

Finally, it is right that the public should recognise, in ANDREW FINDLATER, LL.D., the ACTING EDITOR, who has borne the great burden of the immediate superintendence of this work during its progress from beginning to end. Where a man of learning has given ten years of his life to a task which confessedly he has performed with skill, taste, and unflagging perseverance, it seems to the Editors that, in simple justice to him, his name should be made honourably and gratefully known.

W. & R. CHAMBERS.

EDINBURGH, April 1868.

LIST OF CONTRIBUTORS.

- PATRICK P. ALEXANDER, A.M.,** Edinburgh.
- WM. ANDERSON (the late),** Edinburgh.
- THOMAS C. ARCHER, F.R.S.E., F.B.S.E., F.R.S.S.A.,** Director of the Edinburgh Museum of Science and Art; Corresponding Member of the Scientific Committee of Crown Domains of Russia; &c. &c.
- ALEXANDER BAIN, M.A.,** Professor of Logic in the University of Aberdeen.
- GEORGE BARCLAY, Barrister-at-Law,** London.
- B. BAYLIE, C.E.,** Rotherham.
- ALEXANDER MELVILLE BELL, F.E.I.S.,** Lecturer on Elocution in University College, London.
- JAMES G. BERTRAM,** Edinburgh.
- J. ARTHUR BINNS, Manningham,** Bradford.
- SAMUEL BIRCH, LL.D.,** Keeper of Egyptian and Oriental Antiquities, British Museum; Corresponding Member of the Institute of France, &c.
- JOHN STUART BLACKIE, F.R.S.E.,** Professor of Greek in the University of Edinburgh.
- W. A. F. BROWNE, Commissioner in Lunacy,** Edinburgh.
- A. H. BRYCE, LL.D., D.C.L., F.R.S.E.,** Rector of the Edinburgh Collegiate School.
- ALEXANDER BUCHAN, M.A.,** Secretary of the Scottish Meteorological Society.
- GEORGE BULLEN, Assistant-keeper of the Printed Books, and Superintendent of the Reading-room,** British Museum.
- GEORGE BURNETT, Advocate, Lyon King of Arms.**
- J. H. BURTON, LL.D.,** Historiographer Royal for Scotland.
- DAVID BUXTON, F.R.S.L.,** Principal of the School for the Deaf and Dumb, Liverpool.
- R. CAMPBELL, Barrister-at-Law,** London.
- JAMES CARMICHAEL, Classical Master, Edinburgh Academy.**
- ROBERT CARRUTHERS, Inverness.**
- WILLIAM CARRUTHERS, F.L.S., F.G.S.,** Botanical Department, British Museum.
- W. DYCE CAY, Assoc. Inst. C.E.,** Resident Engineer, Aberdeen Harbour.

UNIVERSAL KNOWLEDGE FOR THE PEOPLE

VITAL STATISTICS.

VITAL STATISTICS. The annual Reports of the Registrars-general for England and Scotland (see **REGISTRATION**) form a valuable storehouse of information on the various subjects connected with vital statistics. Besides detailed abstracts for each year of births, marriages, and deaths, tables of the fatal diseases, classified in combination with ages, are given, and comments upon the salient points of the year's registration accompany the whole. The number of births, marriages, and deaths varies with the state of trade, price of food, and the seasons, and thus furnishes a test of the condition of a nation. We shall notice separately each of these three divisions of vital statistics.

1. *Births.*—From the 25th Report of the Registrar-general for England, it appears that in 1862 there were registered in England (of which the estimated population for that year is 20,336,467) 712,684 births, exclusive of still-born, being at the rate of 3·504 per cent. to the population; or 1 birth to 29 lives. 363,534 were male and 349,150 were female children, being in the proportion of 104 males to 100 females. In Huntingdonshire, however, the proportion was 114 males to 100 females; while Dorsetshire and Rutlandshire reversed the proportions, giving respectively 99·9 and 97 males to 100 females. There is, it seems, no recorded exception to the rule that the births registered in the first six months of the year exceed those registered in the last six. In Scotland, during 1862, we find the number of births registered to have been 107,138; being 3·478 per cent. of the population estimated for that year at 3,079,650.

In England, there are on an average 5 children to a marriage; of these, three attain a marriageable age to replace their parents and those who have no offspring. In France, the average fecundity of a marriage is 3·21 children. In Paris, it is 2·31. Females of the age 20—40 produce 7 in every 8 of the children born; and the parents of nearly half of the children born are under 30. The higher classes of a country have fewer children than the lower, and

a larger proportion of their marriages are unfruitful. The average of European statistics shows 1 pregnancy in 81 to produce twins; 1 in 7400 to produce triplets; 1 in 160,000, quadruplets. The mortality of mothers in childbirth in England and Wales decreased from 1 in 164, in 1848, to 1 in 212 in 1854.

The direct cause of the increase of population in any country (apart from immigration) is, of course, the excess of births over deaths, and this will plainly depend on the following causes: (1.) on the prolificness of marriages; (2.) on the proportion born which lives to marry; and (3.) on the interval between the mean age of marriage and the mean age of death. All these conditions must be favourable to shew the full power of increase in action. They have never yet, on any large scale at least, been found operating with maximum force. In the United States, we find a combination of the first two; but from the 'expectation of life' (see **LIFE, MEAN DURATION OF**) not being favourable in that country, it follows that the third cause is not in favourable operation.

2. *Marriages.*—It would seem to be contrary to the principles of human nature that early marriages should be united to longevity. Youthful marriages arise where the chances of the acquisition of wealth in youth are favourable; and when these are favourable the fact seems to tell against longevity. One of the most interesting and useful points of view in which registers can be considered is the evidence which they give of the varying prevalence of the prudential check to marriage and population in different countries and places. The prudential check will shew itself in two ways—either by the proportion of marriageable persons who are not married, or by the lateness of the average age of marrying. On the supposition of the natural prolificness of women remaining at the same point, the birth-rate will indicate the extent of prudential check in whichever of the two ways it may manifest itself. Suppose that from any cause the prudential restraint on marriage were to become weaker among any

VITAL STATISTICS.

people than it had hitherto been, while the means of maintenance remained the same, what would happen? A corresponding increase would immediately take place in the annual mortality, and the mean duration of life would be correspondingly reduced. And there can be no doubt that the premature mortality which prevails all over the world is mainly owing to imprudent marriages. The death of one half of the human race under the age of puberty does not take place in virtue of any law of man's constitution, but from a disregard of the

admonitions of its laws. Those who have the means of obedience under the conditions of civilised life generally greatly err; yet not so greatly, for the most part, as to be fatal to infant life. It is the want of means, in other words, imprudent marriages, which is the cause of the whole. The following table is taken from an article 'On the Statistics of Marriages among the Families of the Peerage,' by Archibald Day, Esq. (*Assurance Magazine*, No. 48). The results as regards the peerage families are based on the data of a century to December 31, 1855:

PROPORTION PER CENT. OF MARRIAGES.

| AGE. | Peerage Families. | England. (S. Brown.) | | Belgium. | Massachusetts. | Poorer Classes. (St George's-in-the-East.) | Peerage Families. | 1027 Peers. (Sadler.) |
|---------------------------|---------------------------------|----------------------|------------|------------|----------------------------|--|-----------------------|-----------------------|
| | First and Subsequent Marriages. | 1846-1848. | 1851-1852. | 1851-1854. | of Years, to January 1857. | Statistical Society's Journal. | First Marriages only. | First Marriages only. |
| Under 24, | 53.08 | 78.77 | 75.62 | 52.75 | 75.01 | 85.00 | 68.97 | 62.61 |
| 30 to 45, | 33.98 | 18.31 | 19.22 | 39.93 | 19.54 | 14.06 | 31.63 | 27.75 |
| 45 to 60, | 9.50 | 4.03 | 4.25 | 6.05 | 4.12 | .94 | 2.40 | 7.88 |
| 60 and upwards, | 3.44 | .89 | .91 | 1.27 | 1.33 | 0.00 | 0.00 | 1.56 |
| | 100.00 | 100.00 | 100.00 | 100.00 | 100.00 | 100.00 | 100.00 | 100.00 |

In the above, column 1 shews the average rate of marriage at the given ages in the families of the peerage. Thus, of 100 persons married, it will, on an average, be found that 53.08 are under 30 years of age; and so on. Columns 2 and 3 give the same results for all England, as deduced by Mr S. Brown (see his paper in the *Assurance Magazine*, vol. vii.). Column 4 is from M. Quetelet's observations in Belgium. Column 5 from a Report of the committee of the Statistical Society upon the poorer inhabitants of St George's-in-the-East in 1845. Column 6 was compiled by Mr Sadler, and will be found in the second volume of his work on the Law of Population. From the 25th Report of the Registrar-general, it appears that in 1862 there were solemnised in England 164,030 marriages, of which 129,733, or 79 per cent., were according to the rites of the established church. On license there were 19,496; after banns, 102,870; on superintendent registrars' certificate, 3,966; and 3,393 not stated under which head. The mean annual rate of persons married in England is 1.639 per cent. In 1862, there were married in England 22,457 widowers, and 14,737 widows. Of every 100 men who married, 13.7 had been previously married; while 9 per cent. of women married had been married before. These proportions are slightly below the average. 10,615 men and 32,464 women were under age, being in the respective proportions of 6.5 and 19.8 per cent. married. Year by year the number of persons who sign by mark is found to decrease. From 41.4 per cent. in 1845, it had diminished to 28.5 per cent. in 1862. In Scotland, the annual rate per cent. of persons married is 1.334. It must be kept in view, however, that marriage registration is compulsory in England, while in Scotland it is not so as regards irregular marriages.

3. Deaths.—In 1862, the total number of deaths registered in England was 436,566. The increase of deaths with the rising tide of population is such that while there were only two instances—viz., those of 1847 and 1849, in the 13 years 1838—1850, in which the annual number of deaths reached 400,000, there are ten instances in the twelve years 1851—1862 in which it rose above 400,000. Had there been no emigration in the three years 1860—1862, the natural increase of the population of England would in these years have been equal to the towns of Liverpool and Birmingham united. The

mean rate of the mortality of England for the ten years 1853—1862, is found to be 2.211 per cent. In Scotland it is, for the seven years 1855—1861, 2.07 per cent. Nothing, according to the Registrar-general, shews more clearly the different meteorological conditions of the two countries than the fact that in 1862, when the mortality rate was below the mean in England, in Scotland it was above it, being for that year 2.180 per cent. A similar fact was observed in 1860, which was a healthy year in England, and in Scotland remarkably the reverse. The mortality of males is invariably higher than that of females. Throughout the 25 years 1838—1862, male mortality in England never fell so low as 2.100 per cent.; the lowest being 2.136 in 1856; while that of females was, in 11 years out of the 25, below 2.1. In 1856, it was 1.969. When any year is especially healthful, the fact tells most in favour of female life. On an average of the 25 years 1838—1862, out of 100 males there died annually 2.309; while out of 100 females there died annually 2.143; for every 100 females that died, there died 103 males; and of equal numbers living, the number of male deaths to every 100 female deaths was 103. The highest mortality rate during the 25 years, both male and female, occurs in the cholera year 1849, the second highest in the famine year 1847, and the third highest in the cholera year 1854. For the three years 1854—1856, it will be found that the mean male mortality is almost exactly that of the 25 years given, while the female rate is actually slightly (.006 per cent.) less. With regard, then, to the cholera visitation of 1854 at least, it may be held that the victims must have been generally those of diseased or debilitated constitution, who, had there been no cholera, would in course of the next year or so have died from some other cause. The ratio of male to female mortality differs considerably at different ages. Thus, in the first five years of life the ratio is, male per thousand 7.216 to 6.216 per thousand females. From 5 to 10 the male excess is very small, and from 10 to 35 the female rate exceeds the male. But from 45 upwards, women die at a decidedly lower rate than men; and the mean result over the whole of life is in favour of female life. It is, however, a curious fact in the experience of assurance offices, that while female annuitants are longer lived than male, female assured lives are no better. This fact doubtless

VITAL STATISTICS.

arises from the critical periods incident to female life, and to the selection exercised by the public against the offices.

The following are examples of the fluctuations of the rates of mortality in England, at different ages in the 25 years 1838—1862. The mean annual mortality of men aged 25—30, was 975 per cent.; but in 1849 it rose to 1236, and in 1850 it was as low as 877; the range being thus 359 per cent. At age 55—60, the mean male mortality per cent. per annum is 3136, but in 1849 it was 3653, and in 1850 it was 2979; thus giving a range of 674 per cent.

In vol. viii (for 1860) of the *Assurance Magazine* will be found an interesting paper, by Mr Samuel Brown, F.S.S., 'On Mortality amongst American Assured Lives.' We extract the following table, showing the

| AGE. | 'EXPECTATION OF LIFE,' ACCORDING TO | | | |
|------|---|--|---|------------------------|
| | Mutual Life of New York, Fifteen Years. | 'Actuaries,' or Seventeen English Companies. | Massachusetts (1850) Tables. (Editors.) | Fair's English, No. 1. |
| 20 | 43.8 | 41.5 | 39.9 | 39.9 |
| 30 | 36 | 34.4 | 34 | 33.1 |
| 40 | 28.9 | 27.5 | 27.9 | 26.6 |
| 50 | 21.6 | 20.2 | 21.3 | 20 |
| 60 | 14.6 | 13.6 | 15 | 13.6 |
| 70 | 8.6 | 8.6 | 9.4 | 8.6 |

See also, on the subject of American mortality, the *Report of the Mutual Life Assurance Company of New York, for Fifteen Years ending February 1, 1853* (New York, November 1859).

Influence of Occupation.—The interesting question of the influence of different trades, occupations, and habits of life on health and mortality, will be found ably treated in Mr A. G. Finlaison's *Report on*

Friendly Societies, with accompanying tables and returns, printed by order of the House of Commons, August 16, 1853; in Mr Neison's work on *Vital Statistics* (Lond. 1853); and in Mr H. Ratcliffe's *Observation of Rate of Mortality and Sickness existing among Friendly Societies* (Manchester, 1850). From Mr Finlaison, we give the following table, shewing the

| AGE. | MORTALITY PER CENT. AMONG | | | | | | |
|------|---------------------------|---------|---------------|-----------|---------|-------------------|--------------------|
| | Mariners. | Collen. | Metal Miners. | Painters. | Feltes. | Railway Servants. | England and Wales. |
| 20 | .66 | 1.11 | .65 | .. | 1.09 | .. | .74 |
| 25 | 1.71 | .77 | 1.76 | 1.55 | .57 | .52 | .71 |
| 30 | 1.69 | .84 | .81 | .88 | 1.35 | 1.18 | .77 |
| 35 | 2.26 | 1.67 | 1.02 | .87 | 1.77 | 1.00 | .83 |
| 40 | 1.79 | .96 | .29 | 2.04 | 2.05 | 1.56 | 1.03 |
| 45 | 2.71 | 1.09 | 2.00 | 2.09 | .68 | 1.63 | 1.21 |
| 50 | 2.48 | 1.70 | 1.84 | 2.87 | 6.35 | 1.74 | 1.50 |
| 60 | 2.79 | 3.96 | 2.61 | 6.06 | .. | 5.50 | 2.61 |

Among the mariners, a strong contrast is found to prevail between the sickness and mortality rates, the former being low while the latter is high. The same fact is found among painters. 'The practical difference in the distribution of sickness,' says Mr Finlaison, 'seems to turn upon the amount of the expenditure of physical force. This is no new thing, for in all ages the emaciation and decrepitude of the bodily frame has been observed to follow a prodigal waste of the mental or corporeal energies. But it has been nowhere previously established upon recorded experience that the quantum of sickness annually falling to the lot of man is in direct proportion to the demands upon his muscular-power. So it would seem to be, however.'—*Report*, p. 211.

The following is from Mr Finlaison's *Digest of Returns*:

GENERAL AVERAGES.

| | Number returned as sick out of each 100 persons liable to sickness. | Average Sickness per annum to each person, expressed in Days. | Average Sickness per annum to each person sick, expressed in Days. | Mortality per Cent. | Withdrawals and Exclusions per Cent. |
|---|---|---|--|---------------------|--------------------------------------|
| Light labour without exposure to weather, | 21.58 | 9.5489 | 44.2483 | 1.42 | 2.97 |
| Light labour with exposure to weather, | 20.80 | 8.5238 | 41.0053 | 1.37 | 2.82 |
| Heavy labour without exposure to weather, | 26.54 | 10.8122 | 40.7349 | 1.38 | 3.08 |
| Heavy labour with exposure to weather, | 28.04 | 10.6537 | 37.9960 | 1.07 | 3.02 |
| England and Wales, | 24.99 | 10.1155 | 40.4309 | 1.26 | 3.00 |

In Mr Neison's work will be found a valuable chapter on the rates of mortality among persons of intemperate habits. The following shews the period of years which there is an equal chance of living among the

| Age. | General Population of England and Wales. | Persons of Intemperate Habits. |
|------|--|--------------------------------|
| 20 | 44.212 | 15.557, being 35 percent. |
| 30 | 36.463 | 13.800, " 38 " |
| 40 | 29.790 | 11.627, " 40 " |
| 50 | 21.256 | 10.860, " 51 " |
| 60 | 14.285 | 8.947, " 63 " |

} of the duration of life in the general population.

The average duration of life, after the commencement of intemperate habits, Mr Neison finds to be—among beer-drinkers, 21.7 years; spirit-drinkers, 16.7 years; indiscriminate, 16.1 years. Hence it appears that distilled liquors are more hurtful than fermented, but that both combined are worse than either taken separately.

The following table, from Mr Ratcliffe's work, shews the 'expectation' at decennial periods of life, for England and Wales, Manchester Unity Order of Odd Fellows, and various trades:

| England and Wales—Rural, Town, and City; and various Trades. | AGE. | | | | |
|--|-------|-------|-------|-------|-------|
| | 20 | 30 | 40 | 50 | 60 |
| England and Wales, | 39.88 | 33.13 | 26.56 | 20.02 | 13.69 |
| Manchester Unity, | 40.92 | 33.70 | 28.41 | 19.40 | 13.29 |
| Bakers, | 41.92 | 34.05 | 26.58 | 20.09 | 14.12 |
| Blacksmiths, | 37.96 | 30.34 | 23.62 | 18.11 | 13.02 |

| Wool-combers, | 40.97 | 33.97 | 27.64 | 19.41 | 13.24 |
| | 38.56 | 33.73 | 25.96 | 17.64 | 12.29 |

VITAL STATISTICS.

It thus appears that at the early period of life, age 20, the following trades, placed according to their expectation, shew an inferior expectation in comparison with the general results of rural, town, and city districts combined: Clerks, potters, letterpress printers, bricklayers, blacksmiths, mill operatives, plumbers, stone-masons, miners, wool-combers, coopers, hatters, spinners, tailors, dyers, sawyers, millwrights, town and city labourers, and shoemakers. The following trades shew a superior expectation: wheelwrights, butchers, bakers, weavers, domestic servants, carpenters, and rural labourers.

At the last period given in the table, bricklayers, tailors, mill operatives, printers, clerks, spinners, miners, plumbers, hatters, blacksmiths, shoemakers, wool-combers, coopers, and sawyers shew an inferior expectation; and dyers, town labourers, millwrights, potters, wheelwrights, bakers, stone-masons, domestic servants, butchers, weavers, rural labourers, and carpenters, shew a superior expectation, in comparison with the general results.

The comparative healthiness of various occupations among the lower ranks in London is given by Dr Letheby for the years 1855—1856; and another view of the healthiness or unhealthiness of industrial occupations as regards England generally, is given by Dr Farr from the mortality of males at and above the age of 20 following different industrial occupations, in 1851, as compared with the number of persons enumerated in them at the census of that year. While the general annual rate of mortality in England, in 1851, of 1000 males at and above the age of 20, was 20, that of farmers was 28; shoemakers, 18; weavers, 17; grocers, 11; blacksmiths, 18; carpenters, 19; tailors, 19; labourers, 21; miners, 15; bakers, 17; butchers, 21; innkeepers, 30. Taking into account the ages at death, the farmers were the longest lived. Labourers, who form nearly a fourth of the males of England, had a general mortality almost the same as that of the general population, but a very high mortality at great ages. At any one decade of life, the mortality of inn and beer-shop keepers exceeds that of all the other classes, except the butchers, at age 55—65. The mortality of butchers was much heavier than that of any other class, except that of innkeepers, under the age of 65; this fact is supposed to be owing to intemperance, slaughter-house effluvia, and the use of too much animal and too little vegetable food. All occupations have their peculiar dangers which counterbalance each other; thus the tailor is not exposed to the explosions so fatal to the miner, and the labourer has exercise denied to the tailor.

The mortality in the army and navy during peace and war shews many interesting points. Statistics tell us, that soldiers, though picked men, living in costly barracks in Britain during peace, are nearly as unhealthy as the people of our unhealthiest cities, and sometimes almost twice as unhealthy; the average annual deaths of soldiers in Britain being 175 per 10,000; in the household cavalry it is 110 per 10,000; 133 in the dragoon guards; 187 in the infantry of the line; and 204 in the foot-guards. The mortality at all ages in the army at home is almost double that of civilians, ages being alike. Lung diseases and cholera are twice as fatal to soldiers as to civilians. This excessive mortality in the army seems owing to overcrowded and ill-ventilated barracks and military hospitals, sameness of diet, and want of healthy exercise. The following table, from the 25th Report of the Registrar-general for England, shews the annual rate of mortality per cent. amongst the officers and

non-commissioned officers and men in the army abroad in each of the years 1858—1862:

| Year. | Officers. | Non-commissioned Officers and Men. |
|-------|-----------|------------------------------------|
| 1858 | 3-513 | 6-701 |
| 1859 | 2-111 | 3-396 |
| 1860 | 1-688 | 3-603 |
| 1861 | 1-574 | 3-567 |
| 1862 | 1-346 | 1-981 |

The following, from the same, shews the mortality of merchant seamen at sea in the eleven years 1852—1862.

| Year. | Strength. | Deaths. | Annual rate of Mortality to 100 living. |
|----------------------------|-----------|---------|---|
| 1852 | 159,563 | 2,305 | 1-38 |
| 1853 | 172,536 | 3,276 | 1-90 |
| 1854 | 162,418 | 2,772 | 1-71 |
| 1855 | 168,537 | 3,318 | 1-97 |
| 1856 | 173,918 | 3,549 | 2-04 |
| 1857 | 176,387 | 3,444 | 1-95 |
| 1858 | 177,432 | 3,486 | 1-96 |
| 1859 | 172,506 | 3,430 | 1-99 |
| 1860 | 171,592 | 3,760 | 2-19 |
| 1861 | 171,957 | 3,580 | 2-08 |
| 1862 | 173,863 | 3,620 | 2-08 |
| In the 11 years 1852—1862, | 1,881,096 | 36,440 | 1-94 |

Valuable information on military vital statistics will be found in *Military Statistics of the United States of America*, by E. B. Elliott (Berlin, 1863), in *Report and Valuation of the Bengal Military Fund*, by Griffith Davies, F.R.S. (Lond. 1844); and in Mr Neison's Report on the same as at December 31, 1847.

Mortality varies with density of population, place, and climate. Life is longer the better the food, the less the confinement, the more commodious and cleanly the houses. It is a popular notion that a mild winter is most fatal to life, but the truth is the reverse. Either extreme cold or extreme heat immediately raises the mortality rate of Great Britain; the injurious effect of cold is in a great measure, however, confined to those whose circumstances do not enable them to protect themselves against it.

Several of the leading assurance offices of England and Scotland have recently formed a joint plan for deducing the results of their mortality experience to December 31, 1863. The facts of each life are tabulated upon cards, classification according to age being thus rendered extremely easy. In England, the scheme is under the superintendence of a committee of the Institute of Actuaries; in Scotland, of Mr James Meikle, actuary of the Scottish Provident Life Assurance Company.

We give, in conclusion of the subject of vital statistics, the following table, from the 25th Report of the Registrar-general, shewing number and proportion per cent. to population of marriages, births, and deaths in England, France, and Austria in 1862:

| | England. | France. | Austria. |
|---------------------------------------|----------|---------|----------|
| Number of Marriages, | 164,030 | 296,812 | 207,874 |
| Per cent. of Marriages to Population, | 2-807 | 7-798 | 9-13 |
| Number of Births, | 712,584 | 985,589 | 869,094 |
| Per cent. of Births to Population, | 3-504 | 2-626 | 3-945 |
| Number of Deaths, | 436,566 | 602,590 | 676,375 |
| Per cent. of Deaths to Population, | 2-147 | 2-138 | 3-085 |

The mortality rate of France for 1862, it will be seen, is lower than that of England, but usually it is higher.

VITEBSK, a government in the north of West Russia, bounded on the N.-W. by Courland and Livonia, and on the N.-E. by the government of Pskov. Area, 17,191 sq. m.; pop. 804,573. The surface is, as a rule, hilly, though wooded plains, marshes, and lakes abound. The Dwina flows for 466 miles in this government; and by means of this river and its affluents, large quantities of timber are floated down to the port of Riga. The soil is not fertile, the quantity of cereals grown being generally insufficient for local consumption. Flax is successfully grown; and this material, together with timber, constitutes the chief articles of export. Ship-building is carried on on the Dwina; the lake-fisheries are profitable; and tanning is the most important branch of industry.

VITEBSK, a city of West Russia, capital of the government of the same name, on both banks of the Western Dwina, 389 miles south of St Petersburg. It covers a very large area, and contains many monasteries, churches, and synagogues. Manufactures are not extensive; and the trade—the chief articles of which are corn, flax, hemp, tobacco-leaves, sugar, and timber—is carried on by Jews, who form the larger section of the population. A railway is (August 1866) under construction between V. and Dünaburg. Pop. 27,868.

VITELLIN. This name was, until recently, given by chemists to a supposed protein body occurring in the yolk of egg. It has been discovered by Lehman that this substance is merely an admixture of casein and albumen.

VITELLIUS, AULUS, Roman emperor, son of Lucius Vitellius the prince of the sycophants who surrounded Caligula, but who, according to Tacitus, 'in his provincial administration exhibited the virtues of a former age,' was born September 24, 15 A. D., and through his father's influence at court, became consul, 48 A. D., and afterwards proconsul of Africa, where his administration gave great satisfaction. He had been a companion of Tiberius at Capreae, and was equally a favourite with Caligula, Claudius, Nero, and Galba, the last of whom appointed him commander of the legions in Lower Germany, thinking his intense devotion to gastronomic pleasures would effectually prevent his becoming a rival. However, V. had not been a month in his new post, till he had completely gained the affections of his soldiers by extreme familiarity and liberality (strongly contrasting with Galba's parsimony); and on January 3, 69, they took him from his tent, and proclaimed him emperor. This decision was adopted by the rest of the troops in Gaul; and two armies, under Valens and Cæcina, immediately set out to secure Rome, V. following leisurely. A notice of his contest with Otho in Northern Italy will be found under *ОТНО*. The adherents of his predecessor were leniently treated, with the exception of the centurions of Otho's army, who were put to death, an act which greatly offended his own supporters. V.'s journey to Rome was a curious specimen of a triumphant advance, the nominal conqueror being invariably muddled with liquor, and the soldiers of his army straggling about, committing excesses of all sorts with perfect impunity. At last he reached Rome, and without loss of time, proceeded, by right of his office as Pontifex Maximus, to deify Nero. The administration was mostly in the hands of the freedman Asiaticus, though P. Sabinus (brother of Vespasian), and the two generals who had gained for him the imperial dignity, were high in authority; and the government was marked by great moderation, for V. was too far sunk in the vilest debauchery to be capable of tyranny. But he was not long allowed

to disgust the respectable part of the citizens of Rome; for the legions of Pannonia and Illyricum, having proclaimed Vespasian emperor, advanced into Italy under Antonius Primus. They were opposed by the Vitellian troops, commanded by Cæcina, but through the treachery of the latter general, gained a decisive victory near Bedriacum, and another, on the following evening, over another Vitellian army which had marched to the support of the first. V., at this critical period of his fortunes, nothing abated his swinish indulgences; but his brother, Lucius, in the south, displayed more energy, and defeated Vespasian's partisans in several battles. Meantime, the soldiers, enraged at the treachery of P. Sabinus, and his allies among the senators and knights, stormed the Capitol, and slew Sabinus. From this time, Rome was a scene of unintermitting violence and bloodshed, till the troops of Primus entered the city. V. was found wandering about his palace in a state of stupid terror, and after being ignominiously exposed in the streets, was killed by repeated blows, his head carried about Rome, and his body thrown into the Tiber, in December 69 A. D.—For a complete sketch of his private life, see Tacitus's *Historia*, ii., iii., and Dion Cassius, 65; see also Suetonius, *Vit. Duodec. Cæs.*

VITELLUS O'VI, or the *yolk* of the egg of the domestic fowl, is employed in pharmacy for the purpose of administering substances insoluble in water (the oils and resins, for example) in the form of emulsions. The *white* is employed as an antidote, in cases of poisoning by corrosive sublimate or with salts of copper. As a dietetic article in the sick-room, eggs, either lightly boiled or poached, or as ingredients of puddings, are invaluable; the stomach, after an acute disease, being often able to digest an egg, when any more solid article of animal food would set up gastric irritation.

The article *EGG*, *CHEMISTRY OF*, requires a few supplementary remarks. The albumen, occurring in the *white*, is for the most part in combination with soda; in addition to this principal ingredient, the white contains fats (chiefly margarin), grape-sugar (averaging 5 per cent. of the dried residue), and soluble salts, in which the chlorides preponderate, with a little silica (for the formation of feathers) and fluorine. The yolk consists of casein (forming 14 per cent.), albumen (about 3 per cent.), fats, some of which contain phosphorus (about 30 per cent.), a little grape-sugar, and mineral constituents (about 1.5 per cent.), in which there is a great preponderance of potassium compounds and phosphates. Of the pigments of the yolk we only know that there is both a yellow and red pigment, and that one at least of them contains iron. It is difficult to conceive a more concentrated form of nourishment than a food thus composed of casein, albumen, fat, sugar, potassium salts, phosphates, and iron; and its resemblance in composition to milk is very remarkable.

The shell of the egg consists almost solely of carbonate of lime (about 97 per cent.), with a little phosphate of lime, and traces of magnesia and organic matter. The variety of colour in the eggs of different birds is supposed to be due to certain modifications of bile-pigment with which they come in contact in the cloaca.

VITERBO, a city of Central Italy, in the Papal States, stands amid gardens and vineyards, at the foot of Monte Cincino, 42 miles north-north-west of Rome. Its well-built streets are paved with marble, and there are numerous elegant fountains. Its Gothic cathedral contains the tombs of several popes, and is memorable as the scene where Guy de Montfort

assassinated Prince Henry, brother of Henry III. of England. Among other attractive buildings are the churches, mostly rich in works of art, the bishop's palace, and the city halls. There are many monuments of antiquity, both within and without the city. Alum, vitriol, and sulphur abound in the neighbourhood, and exquisite wines are produced. No important manufactures are carried on. Pop. 16,000.

VITEX, a genus of trees or shrubs of the natural order *Verbenaceae*, the fruit a drupe, with a 4-celled stone. *V. Agnus castus*, the CHASTE TREE, a native of the countries around the Mediterranean, is downy, with digitate leaves white on the back, and has an acrid fruit, the seeds of which are used in

Chaste Tree (*Vitex Agnus castus*).

Smyrna as an external application in cases of colic. It derives its name from the practice of Grecian matrons to strew their couches with its leaves, especially during the sacred rites of Ceres, in order to banish impure thoughts; for which purpose a syrup, made of its fruit, was also, and perhaps still is, used in convents in the south of Europe, although, in reality, it possesses stimulating properties.—*V. Negundo*, an Indian species, has aromatic leaves, which are bruised and applied to the temples for relief of headache.—*V. trifolia* is another Indian species, whose leaves are a powerful discutient.

VITILIGO was the name given by Celsus to some kind of cutaneous eruption which cannot be clearly identified. The term has, in recent times, been used by different writers in different senses, but is now most commonly employed to designate cutaneous patches characterised by loss of pigment.

VITIOUS INTERMISSION, in the Law of Scotland, means the unwarrantable interference and management of the movable estate of a deceased person. The consequence is, to make the intruder liable for all the debts of the deceased person, though far exceeding the value of the assets. The mode of putting an end to this liability is to obtain confirmation as executor in the usual way.

VITORIA, a pleasant, gay, and thriving inland town in the north of Spain, capital of the province of Alava, stands on a gentle elevation, 70 miles west of Pamplona. The old town, the Villa Suso,

consists of dark and tortuous streets; the new town is regularly laid out. There are several charming *alamedas*, or public walks, especially La Florida and El Prado. The Plaza Nueva, a square of 220 feet, was built in 1791, and under its arcades is the favourite promenade in winter. Brass and iron wares, earthenware, candles, and linen goods, are manufactured, and a brisk general trade is carried on with towns further inland. The plain surrounding the town is extensive and fruitful. The climate is temperate and healthy. Pop. 18,700.

V. will be ever memorable for the decisive and important victory which Wellington gained here over the French under Joseph Bonaparte and Jourdan, June 21, 1813. The numbers in this encounter were nearly equal. The French lost 6000 killed and wounded, 150 cannon, together with baggage, eagles, and an amount of booty in pictures, &c., which amounted to 5,000,000 dollars. The direct result of the battle of Vitoria was, that the French had to retire from Spain. About this engagement, Southey says the French 'were beaten before the town, in the town, through the town, out of the town, behind the town, and all about the town.' The loss of the British, Portuguese, and Spaniards was 4900 men.

VITRÉ, an ancient town of Brittany, France, in the dep. of Ille-et-Vilaine, on the left bank of the Vilaine, 24 miles east of Rennes by railway. It is a curious specimen of the old towns of the middle ages, and is still surrounded with Gothic ramparts flanked with towers. At three miles' distance is the Château des Rochers, the celebrated residence of Madame de Sévigné. Manufactures of cloth and hats are carried on. Pop. 8900.

VITRIFIED FORTS, the name given to certain remarkable stone enclosures bearing traces of the action of fire, about fifty of which exist in various parts of Scotland. They are generally situated on a small hill, overlooking a considerable valley, and consist of a wall, which may have originally been about 12 feet in height, enclosing a level area on the summit of the hill. The most remarkable feature of these structures is, that the wall is always more or less consolidated by the action of fire—in some cases only to the extent of giving a glassy coating to its inner side, while in other instances the vitrification has been more complete, the ruins assuming the character of vast masses of coarse glass. There is sometimes an exterior circuit more or less distant from the interior, composed of loose blocks of stone, which bear no traces of vitrification. Structures of this kind are to be found at Noath and Dunnidear, in Aberdeenshire; Craig Phadrick, Tordun, and Glenever in Inverness-shire; Knockgarril, in Ross-shire; Creich, in Sutherlandshire; Dunskeig, in Argyleshire; Finhaven and Laws, in Forfarshire; Barryhill, in Perthshire; Kingarth, in the island of Bute; Anwoth, in Kirkcudbright, and elsewhere, but principally in the northern counties. They were first noticed by Mr John Williams, in his *Account of some Remarkable Ancient Ruins lately discovered in the Highlands and Northern Parts of Scotland*, published in 1777. Mr Williams's observations led him to conclude that they were artificial structures intentionally vitrified by a partial melting of their materials. Mr Williams's views were combated by other writers, who contended that the supposed forts were of volcanic origin, a supposition quite irreconcilable with their obviously artificial character. In 1828, the subject engaged the attention of the Society of Antiquaries of Scotland, a series of careful observations being made by Dr Samuel Hibbert, one of the secretaries of that body; and the conclusion arrived at was, that while the

structures were artificial, the vitrification was an accidental effect, which might have arisen from such causes as the frequent kindling of beacon-fires as signals of war and invasion, or of bonfires forming a part of festive or religious rejoicings. The burning of signal or other fires, in particular cases, in the most instead of within the wall, may have caused the occasional external vitrification. This view of the origin of these structures has, ever since Dr Hibbert's observations, been very generally accepted. The alkali produced from the accumulation of the ashes of continually blazing wood-fires would be a powerful aid to the fusion of stone: sandstone, otherwise infusible, is made perfectly capable of vitrification by the absorption of melted alkali. The view originally taken by Mr Williams has since been supported by Dr John McCulloch, who argues that the character of the works shews them to have been designed for defensive military posts, and observes, that in some cases where the most accessible materials for a stone-fort are incapable of vitrification, stones more capable of being vitrified have been brought from a distance. Unless in a single questionable instance in France, no similar structures have been observed out of Scotland; whence it has been suggested that they must be the result of rites and customs peculiar to the races of North Britain. Mr J. H. Burton considers the preponderance of the evidence to be in the direction of design; but the question cannot be considered to be set at rest yet.—See *Archæologia Scotica*, vol. iv.; McCulloch's *Highlands and Western Islands of Scotland*; Wilson's *Prehistoric Annals of Scotland*; Burton's *History of Scotland*, chap. 3.

VITRINA, CAMPEGIUS, an eminent Dutch divine and commentator, was born at Leuwarden in Friesland, 16th May 1659. He studied at Franeker and Leyden, at which last place he was created D.D. in his 20th year. In 1681, he was appointed Professor of Oriental Languages; and two years later, received the chair of Theology in the university of Franeker, where he died, March 21, 1722. V. is regarded as one of the most learned and laborious divines of his age, and has left many excellent and erudite works, chiefly commentaries on portions of the Scriptures, nearly all of which are in Latin. Among others may be mentioned, *Commentarius in Jesaiam*; *Anacrisis Apocalypseos Johannis Apostoli*; *Commentarius in Jeremiam*; *Commentarius in Zechariam*; *Vetus Synagoga*; *Disertationes Sacrae*; *Typus Theologicae Propheticae*, &c.

VITRIOL (derived from the Latin *vitrum*, glass) is a term which the early chemists applied to glass-like salts, distinguishing them by their colours into blue vitriol, green vitriol, and white vitriol. *Blue Vitriol* is still the popular name for sulphate of copper, which may be obtained on a large scale in various ways, but most simply by boiling copper in an iron pot with dilute sulphuric acid, by which means we obtain a salt having the formula, $\text{CuO}, \text{SO}_4 + 5\text{Aq}$, and crystallising in oblique prisms of a clear blue colour, which are soluble in four parts of cold, and two of boiling water, and when moistened, reddens litmus paper. In large doses, it acts as a powerful irritant poison, unless, as is frequently the case, it is rejected by vomiting. In small but repeated doses (as from half a grain, gradually increased to two grains, made into pills with conserve of roses), it acts as a tonic and astringent, and will often check the discharges in cases of chronic diarrhoea and dysentery, when other medicines have failed; and according to Neligan, it has been found serviceable in croup by checking excessive bronchial secretion. It has been much employed in cases of epilepsy, and is a valuable remedy in chorea and

other spasmodic diseases, especially when they occur in weak constitutions about the period of puberty. Its use in doses of from 10 to 15 grains as an active emetic is mentioned in all works on materia medica; but sulphate of zinc in a dose of a scruple, is as efficacious, and safer. Externally, this salt in solution (varying from one to ten grains in an ounce of water) forms a good application to indolent ulcers, aphthæ, cancrum oris, and the sore throat in scarlatina; it is also used in chronic ophthalmia, and as an injection in cases of urethral or vaginal discharges. In the solid state, it is used as a caustic to repress excessive granulations (proud flesh), to destroy warts, and to excite indolent ulcers.

Green Vitriol is the popular name for sulphate of iron. Its characters, the method of obtaining it, and its therapeutic uses, are sufficiently noticed in the article IRON.

White Vitriol will be described in the article ZINC.

Oil of Vitriol is the old name given to commercial sulphuric acid, in consequence of its oily appearance, and of its being formerly obtained from green vitriol.

Elixir of Vitriol is the old name for the aromatic sulphuric acid of the Pharmacopœia. It is a mixture of three ounces of sulphuric acid and two pints of rectified spirit, in which powdered cinnamon and ginger have been digested. Its uses in doses of from ten to thirty minims, in a wine-glassful of water, are much the same as those of dilute sulphuric acid, but it is more agreeable to the taste, and sits more lightly on the stomach.

VITRO DI TRINA, the name given to a beautiful kind of glass which was made by the Venetians in the 15th century. Its distinguishing character is a series of wave-like marks in opaque colours, but usually white, arranged pretty regularly in the substance of transparent glass.

VITRUVIAN SCROLL, a continuous scroll-work forming a kind of cresting, used in classical architecture.

Vitruvian Scroll.

VITRUVIUS, the name of two Roman architects, the most celebrated of whom is MARCUS VITRUVIUS POLLIO, about whom we have no direct information further than the mention of his name by Pliny and Frontinus, though, from the references to himself in his own work, we can gather that in all probability he was born about 76 or 80 B.C. He received a liberal education, pursued specially those studies which were calculated to fit him for the profession of an engineer and architect, and was engaged in the African war (46 B.C.) as superintendent of military engines. He does not seem to have become very popular as an architect, and never succeeded in acquiring wealth, though the constant patronage which the emperor (Augustus) was induced by his sister (probably *Octavia Minor*) to extend to him, insured him comfortable subsistence during his life. The only public work he executed was a basilica at Fanum. V., in his book, *De Architectura*, enters at some length into the reasons which induced him to write it, the chief of them being, the care bestowed by his patron (after settled peace had been secured to the empire) on buildings public and private, his intention to erect numerous edifices, and the danger that, owing to the depraved architectural taste of the time, the beauty and correctness of the pure Grecian models would be neglected. The *De Architectura* is arranged in ten books; the first of which contains a dedication to the emperor, a general view of architectural science, hints as to the proper subjects of study for young aspirants,

and directions for building cities; the *second* treat of the early history of architecture, and of the materials employed at various times, and contains a sketch of the physical theories of various philosophers; the *third* and *fourth* treat of the erection of temples, and in connection with this, of the four orders of architecture, Ionic, Corinthian, Doric, and Tuscan; the *fifth* treat of public buildings; the *sixth*, of private houses in town or country; the *seventh*, of the finishing and decoration of private buildings; the *eighth* of water, the mode of discovering it, whence it may be obtained, and the modes of conveying it in large quantities to a distance; the *ninth*, of the principles of gnomonics, the rules for dialling, and other subjects physical and astronomical; and the *tenth*, of machines used in building and in military warfare, of the mechanical powers, of mills, engines for raising water, odometers, &c. To each book there is a preface, more or less connected with the main subject of the book, and it is in these prefatory remarks that we discover what we know of V.'s personal history. There have been many editions of V.; the first was published along with Frontinus's *De Aquaductibus* at Rome about 1486, and afterwards at Florence (1496) and Venice (1497). Rude woodcuts were introduced into various subsequent editions; and the edition of Bode (Berl. 1800) has a volume of plates; but the best edition, that of J. G. Schneider (Leip., 3 vols. 1807—1808), is without illustrations.—See Smith's *Classical Dictionary of Biography and Mythology*.

VITRY-LE-FRANCOIS, a town of France, in the dep. of Marne, on the right bank of the river Marne, 128 miles east of Paris by railway. The first site of the town was at Vitry-en-Perthois; but it was taken and burned by Charles V. in 1544. François I. rebuilt V. on its present site, surrounded with fosses and ramparts, and erected a castle for its protection. There are manufactures of hats and cotton goods. Pop. 7600.

VITTO'RIA, a modern town of Sicily, in the province of Siracusa, 18 miles north-west of Modica, on the Camarana. It possesses little interest, and is made only a noonday resting-place for travellers. The soil of its vicinity, however, is fertile in fruits and wines, bee-culture is carried on, and the town maintains an active trade in silk and cattle. Pop. 15,855.

VITUS, ST. DANCE. See CHOREA.

VIVANDIÈRE, in continental armies, and especially that of France, a female attendant in a regiment, who sells spirits and other comforts, ministers to the sick, marches with the corps, and contrives to be a universal favourite. Although a familiar friend to all, these women contrive to maintain themselves respectable, and generally respected; and a corps is usually extremely jealous of the slightest discourtesy being shewn to its vivandière. The woman wears the uniform of the regiment, short petticoats taking the place of the man's tunic.

VIVERRIDÆ, a family of *Carnivora*, having the body elongated, the claws partly retractile, the pupil of the eye circular during the day, and not contracted into a vertical line, as in the *Felidæ*, and, in general, a strong musky odour, proceeding from a secretion in a pouch near the anus. To this family belong the civet, genet, ichneumon, &c.

VIVISECTION—a term which is employed to designate operations performed with the knife on living animals, with the view (1) of increasing our physiological knowledge; (2) of confirming previously known facts; and (3) of giving dexterity in operative surgery—is a course of procedure which may

be traced back to almost the earliest periods of medicine and surgery, and was largely practised in the Alexandrian School. It is, however, only comparatively lately—about half a century ago, when the barbarous experiments of Magendie, Brachet, and other distinguished French physiologists, became known in this country—that the subject has attracted much popular notice; and during the last ten years, attention has been so specially drawn to the atrocities systematically carried on in the great French veterinary colleges at Alfort and Lyon, that a deputation of 'The Royal Society for the Prevention of Cruelty to Animals' laid a statement of the facts before the Emperor Napoleon. When it is stated, that with the nominal object of teaching the veterinary students at Alfort to become skilful operators, six living horses were supplied to them twice a week—that sixty-four operations were performed on each horse, and that four or five horses generally died before half the operations were completed—that it takes nearly two days to go through the list—and that all the old exploded operations, as well as those now practised, were performed—and lastly, when it is borne in mind that most, if not all, these operations could just as instructively have been practised on the dead animal (as is done in this country), there cannot be a doubt that a vast amount of unwarrantable and gratuitous cruelty was carried on in these establishments. Although the subject was brought before the *Académie des Sciences*, and warmly discussed, the final conclusion was, 'that the complaints of the London Society are totally without foundation; and that there is no occasion to take any notice of them.' We believe that it is only by the veterinary colleges of France that the view is advocated that vivisection is necessary for the purpose of giving dexterity in surgical operations.* But while all right-minded persons—except the majority of the members of the French Academy, whose votes were probably influenced by a feeling of nationality—must concur in the view, that the argument in favour of vivisection utterly breaks down, some go further, and doubt whether any experiments on living animals, performed with the object of advancing medical and surgical knowledge, and of thereby relieving, indirectly, human suffering, or prolonging human life, are, on moral grounds, to be regarded as justifiable. In opposition to this view, it is maintained that, under certain circumstances, and with due restrictions, such experiments are not only justifiable, but their performance becomes a positive duty. It may be observed that, though in stating this controversy the term vivisection is retained, the remarks apply to all kinds of experiments on living animals. It is universally admitted that man may destroy animals for his food, and to furnish him with many of the necessaries and luxuries of life; and most persons go a step further, and see no impropriety in the pursuit of field-sports. Now, as Dr Markham argues in his excellent prize essay on this subject, in all these cases of admittedly legitimate destruction of animal life, the infliction of pain is a necessary ingredient. In some modes of destruction, the death-blow is dealt at once, and the pain is but fleeting; whilst in others, the agony of the death-struggle is equivalent to a prolonged and painful torture. An ox may be at once stunned, while the animal bled to death suffers prolonged convulsive struggles. The humanitarian, if he be a sportsman, thinks little of the lingering pain which a wounded

* *Vivisection: is it necessary or justifiable?* Being two prize essays, published by the Royal Society for the Prevention of Cruelty to Animals (Lond. 1866).

bird or broken-legged hare undergoes; nor, if he be engaged in the whale-fishery, does he lament over the prolonged suffering which the object of his pursuit must suffer before its capture. If, then, man can legitimately put animals to a painful death in order to supply himself with food and luxuries, why may he not also legitimately put animals to pain, and even to death, for the far higher and more noble object of relieving the sufferings of humanity, and of prolonging human life? To point out what gain has accrued to physiology (and hence, indirectly, to the healing art) by experiments on living animals, would occupy many pages of this work. It is sufficient to allude to the facts, that the doctrine of the circulation of the blood, and of the existence of, and circulation through, the lacteals, was thus established, and that nearly the whole of our present knowledge of the functions of the nervous system has been thus obtained, and could never have been afforded by the most minute anatomical research,* and that in consequence of the knowledge thus obtained we no longer divide a motor nerve, and thus paralyse the face, in the hope of relieving tic douloureux; while, on the other hand, thanks to the researches of Brown-Sequard, Bernard, and others, we can now see our way to a more rational mode of treating epilepsy, various obscure forms of paralysis, &c. Without vivisection, we could never clearly have understood the causes of the sounds of the heart, without the knowledge of which the stethoscope would have been useless in the diagnosis of cardiac diseases; nor should we have known anything of the true nature of that mysterious disease, diabetes. The Hunterian treatment of aneurism by ligature, which has saved hundreds of human lives, was worked out by experiments on living animals. The study of anaesthetics, which, after prolonged investigation, led to the introduction of chloroform (soon, possibly, to be superseded by some even less dangerous agent), was unquestionably accompanied by the suffocation of many animals; but surely no one who can form any estimate of the vast amount of misery which has been spared to humanity by the general introduction of the use of chloroform into surgical and midwifery practice, can regret the sacrifice. Indeed, the advantage of the discovery is experienced in more

* See on this subject the remarks of Professor Owen (appended, by permission, to Dr Markham's prize essay): 'The closest and most persevering observation of the phenomena in the dead body could only teach the invariable relations of the nerves or tendons [each of which was known under the common name of *neuron*] to the muscle. When the idea occurred to the Alexandrian physiologist to divide, in the living animal, the several kinds of white cords, called *neura* by his predecessors, then, and then only, was his science enriched with the power of distinguishing true nerve from tendon, ligament, &c. Mr Walker, of Edinburgh, was the first to suggest, in reference to the previously known anatomical facts of the two roots of the spinal nerves, that one was sensory, and the other motory. Mr (afterwards Sir Charles) Bell has deservedly reaped the credit of the discovery by putting the idea to the test of experiment. He alone discovers who proves—who converts a speculative into a positive conclusion; and it is not true, however the dicta of J. S. Mill may seem to support the proposition, that in regard to these and other great truths of physiology, experiment has been resorted to "only to confirm the theory already fixed in the mind of the discoverer, and to demonstrate it to the world." For a truth to be operative or available, it must be "demonstrated to the world." Whether, prior to his experiments, the theory of sensory and motory nerve-roots was fixed or loose in the mind of Bell, it would have died with him, had he not, or rather the better experimenters that followed him, demonstrated its truth to the world.'

ways than one upon the lower animals, since the domestic animals are subjected to its beneficent influence when surgical operations are necessary, and since, in most cases, animals subjected to physiological experiments are now usually rendered insensible by it. If such questions as—the best means of restoring to life persons apparently drowned—why chloroform sometimes kills, and how those who are suffering under apparently fatal effects can be best recovered—admit, as they doubtless must, of a solution, that solution must be sought for in experiments on living animals. These and a multitude of similar considerations which might be adduced, are sufficient, it is maintained, to lead any unbiassed inquirer to the conclusion that experiments on living animals, performed with the object of advancing medical, surgical, or toxicological knowledge, and of thereby indirectly relieving human suffering, or of prolonging human life, are not only justifiable, but a matter of duty. There are, however, certain conditions, the fulfilment of which (as Dr Markham well points out in his prize essay) is indispensable to the proper and rightful performance of experiments on living animals. First, the experimenter must be equal to the task he has undertaken; he must be a skilled anatomist, and a physiologist, not only thoroughly acquainted with all the known facts bearing on the subject which he is about to investigate, but he must be capable of duly appreciating all the facts which his experiment may present. Secondly, if the experiment admits of it, the animal should be submitted to the action of chloroform during the operation. Thirdly, when a fact in physiology has been once thoroughly determined, all repetitions of the experiments, for the mere purpose of exhibiting them to classes of students, are unnecessary, and therefore unjustifiable. Professor Owen, speaking on this point, observes: 'I reprobate the performance of experiments on living animals to shew the students what such experiments have taught the master; whilst the arguments for learning to experiment by repeating experiments on living animals, are as futile as those for so learning to operate chirurgically.'

VIZIER, or VIZIR (pronounced *viz-ir*'), the title of various high functionaries in the Ottoman Empire, and other Mohammedan states. The word, which is of Arabic origin, and signifies 'he who bears or supports (a burden),' was first bestowed as a title of honour on the chief-minister of the first Abbaside calif, in 750 A. D. During the decline of this dynasty, the vizier had to 'bear the burden' of government almost entirely, and consequently, increased so much in power and authority, that the califs thought it prudent to counteract his influence by the creation of the new dignity of *Emir-al-Omrah* (q. v.), which, being generally bestowed upon one or other of the powerful alien princes who had made for themselves sovereignties in Persia, was found to be an efficacious counterpoise. The dignity of vizier was first introduced among the Ottoman Turks during the reign of their second sultan, Orkhan, and the title was exclusively confined to the sultan's prime-minister; but in 1386, it was conferred by Amurath I. on his victorious general, Timur-tash, and the prime-minister's title was then changed into *vizir-a-z'hem*, 'grand or illustrious vizier.' From this period, the number of viziers was gradually increased, but since the commencement of the 18th c., only seven of them are ministers, the 'grand vizier,' and the six 'viziers of the cupola,' who constitute the Divan (q. v.). The grand vizier is, after the sultan, the most important personage of the Turkish Empire; he unites in his own person the whole powers of the state, and is charged with a corresponding responsibility. The

other six viziers in the divan, who are generally men well versed in law, and practically acquainted with the details of administration, form a council of advice, to whom the grand vizier applies when he thinks proper, but who possess otherwise no real power. The grand vizier, on his nomination, receives a sheet of parchment, on which is engraved the name of the sultan, and this he is bound always to carry in his bosom.—The title of vizier is also given to all the Pashas (q. v.) of three tails.

VIZZINI, a town of Sicily, in the province of Catania, and 29 miles south-west of the city of that name, stands on a hill. It is well built, and besides containing a college and hospital, there are a number of handsome buildings and churches, containing many fine pictures. Fruits in abundance are produced, and agates are found. Pop. 18,400.

VLAARDINGEN, an unwall'd town in South Holland, lies about five miles west from Rotterdam, at a short distance from the New Maas. It has a good haven, and sends annually a large fleet of vessels to the herring-fishing, besides carrying on a considerable shipping-trade with the Mediterranean, Norway, North America, Portugal, and Spain. Pop. (31st December 1865) 8324. Besides the herring and cod fishing and shipping-trade, the industries are: shipbuilding, rope-spinning, distilling gin, sawing wood, grinding corn, boiling oil, tar, &c. V. is one of the oldest towns in South Holland, the church now called the Reformed Church having been consecrated by Willebrord in the 7th c., but nearly rebuilt in 1744. It was the birthplace of the poets Arnold Hoogvliet (1687—1763) and Jacob van Dijk (1745—1828).

VLADIMIR, the name of two celebrated Russian princes, the former of whom, **VLADIMIR SVIATOSLAVITCH**, was the first Christian sovereign of Russia. On the death of his father (972), V., though illegitimate, received Novgorod as his share of the heritage, but was driven out by Jaropolk, who had already murdered the third brother, Oleg. However, V., by the aid of a body of Varangians (from Scandinavia), returned and overcame Jaropolk, by whose assassination (980) he became sole ruler in Russia. Disembarrassing himself of his dangerous allies by persuading them to take service with the Byzantine emperor, he next recovered by force from the Poles the provinces of which they had deprived his brother, and subdued various tribes which had recently revolted. Russia at this time was an ill-compacted empire; the various Slavic tribes which dwelt within its boundaries acknowledged the sovereignty of the Russian princes solely by the payment of tribute, and that only when the princes were powerful enough to enforce it; hence it was the custom for the princes personally, or their delegates, to go their regular rounds after the fashion of tax-collectors, backed up by a large armed retinue. V. tried to increase the central authority, and one of the means he adopted was the erection at his capital, Kiev, of the idol Perun (Thunder), the supreme divinity of the Slaves, and of the images of other inferior deities, Slave and Finnish. But a few years more effected a remarkable change; many of V.'s subjects were Greek Christians; his mother, Olga, had become one; besides, he wished to be allied with the Byzantine imperial family; and moved by these and other reasons of personal or patriotic ambition, he resolved to turn Greek Christian. His mode of arriving at conversion and matrimony was as curious as effective; he first made an attack upon the Byzantine Empire, then sent an embassy to Constantinople, promising peace and his conversion, in exchange for the hand of Anna, the sister of Constantine IX.; threatening war in case of

refusal. His demands were gladly complied with; and after his marriage and baptism at Kherson in 988, he returned to Kiev, destroyed all the idols, and commanded his subjects to be baptised. They had not the slightest objection to be baptised, if their feared and admired prince wished it; and for days the Dnieper was crowded with applicants for the first testing ordinance of Christianity. It could hardly have been expected that a conversion managed in such a fashion would have affected the manners and conduct of such an arbitrary, violent, and daring prince as V.; yet, strange to say, from 988 he appeared to have undergone a thorough mental and moral transformation; churches were built, schools established, capital punishment was supplanted by a fine, and such excessive lenity shewn to all criminals, that in the interests of good government, it was found necessary to remonstrate with the thorough-going convert. Formerly, the wisdom and valour for which he was renowned were equalled by his licentiousness, so that the chronicles had more than one reason for saying that 'he was like unto Solomon;' but the strictest chastity characterized the latter part of his life; and his charity to the poor, and personal forbearance, were extreme. He died in 1014, three years after his wife Anna. The Russian Church has decreed him the epithets of 'saint,' and 'equal of the apostles.'—**VLADIMIR II. VSEVOLODOVITCH**, surnamed *Monomachus*, grand-prince of Kiev, the great-grandson of the preceding, was born in 1053. His father being a younger son, there seemed to be little chance of V.'s attaining power in the ordinary course of events, in his own country; and he accordingly led a band of auxiliaries to join Boleslas II. of Poland in his wars with Bohemia; gaining such renown, as on his return ranked him at the head of Russian warriors. V.'s father having, as the eldest of the Russian princes, succeeded to the grand principality of Kiev (1078), V. took advantage of the opportunity to wrest from their lawful possessors, Smolensk, Tchernigov, and Novgorod; though some years afterwards, his cousin Oleg, the dispossessed prince of Tchernigov, with the aid of the Polotsee or Cumans (a Turkish nation which was at that time the terror of the Russians), recovered his dominion. V. having subsequently routed the Polotsee in several engagements, became so extremely popular, that in 1112 he was chosen grand-prince of Kiev, and for 13 years displayed his eminent qualities as a ruler and a warrior. The maintenance of internal tranquillity, the improvement of old, and the building of new towns, and the encouragement of commerce, on the one hand; and the successful campaigns against the Tchudes, Poles, Polotsee, and Bulgars (a Mohammedan commercial people settled on the Volga), on the other, are the principal characteristics of his reign. Most of V.'s fame, however, rests on his writings, which present an interesting picture of the internal life of Russia in the 11th c., and indicate prominently the earnest practical influence of the newly introduced Christianity. V.'s mother was a daughter of Constantine Monomachus; and Alexis Comnenus, who wished to be on good terms with his powerful northern neighbour, is said to have sent him the crown, sceptre, and sword of his grandfather, which are still shewn as such, and which are employed in the coronation of the czar.

VLADIMIR, a government of Russia, bounded on the E. by the government of Nijni-Novgorod, and on the S.-W. by that of Moscow. Area, 18,296 sq. m.; pop. (1866) 1,223,000. The surface is level or undulating; the soil consists chiefly of clay or sand, and is fertile only in exceptional spots. The principal rivers are the Oka and its tributaries, of which the chief is the Kliasma, a navigable stream. Of the

lakes, which are numerous, but of inconsiderable size, that of Pereiaslav is remarkable for its productive fisheries, and is famous in history as being the cradle of the Russian fleet. After St Petersburg and Moscow, the government of V. is the most actively industrious in the Russian Empire. Of its manufactured goods, cotton-yarn and cloth are made to the value of 13,000,000 roubles annually; chintz and dyed goods, 12,000,000 roubles; linen, 2,000,000 roubles; glass, 1,000,000 roubles; iron and brass foundries produce goods to the value of 1,000,000 roubles; and the manufactures of chemicals and paper are very extensive. The inhabitants are also much employed in painting images and in knitting stockings, which are used in Russia and Siberia, and yield 1,000,000 roubles per annum. The grain-crops raised are insufficient for local consumption, and corn is imported from neighbouring governments. Hemp is successfully grown; and besides being used in considerable quantities in local manufactures, is exported to Archangel and St Petersburg. Forests, mostly of pine, form a border round the government, but do not occur in the interior. In the 9th c., the country was inhabited by Finns; and though it was subsequently conquered and settled by the Slavonians, traces of the original inhabitants are visible in the present population.

VLADIMIR, a town of Great Russia, capital of the government of the same name, stands on the left bank of the Kliasma which is high and wooded, 125 miles north-east of Moscow. It was founded in the 12th c., during the ascendancy of the Dukes of Vladimir, and was the capital of Russia till 1828. It contains many historical remains, as the Kremlin; the 'Golden Gate,' built in 1156; ruins of old fortifications, and many ancient churches. The ecclesiastical seminary is important. There are several manufactures, and a trade in corn. Cherries are a considerable local product. Pop. (1866) 12,248.

VODENA, a beautifully-situated town of European Turkey, in Rumili, on a mountain slope, 46 miles west-north-west of Saloniki. Water is here very abundant; torrents rush headlong down the middle of all the streets, and the sound of cascades is everywhere heard. The houses, from the archbishop's palace to the humblest cottage, are picturesque, but are not otherwise remarkable. The streets are wretchedly paved. V. occupies the site of the ancient Edessa, the early capital of Macedonia. Pop. estimated at 12,000.

VOGHERA, a city of Northern Italy, in the province of Pavia, stands on a fertile elevated plain, in a district rich in vineyards, orchards, and corn-fields, 24 miles east-north-east of Alessandria by railway. The Via Emilia passes through the town, and divides it into two parts. There are several handsome squares, of which that of the Duomo is the chief; the streets are adorned with porticoes; and there is an old castle, built by Galeazzo Visconti in 1372. The civic palace contains many valuable parchments and manuscripts of the 11th, 12th, and 13th centuries. Silks, linens, canvas, and leather are manufactured. Pop. 13,800.

VOICE (Lat. *vox*) may be defined as an audible sound produced by the larynx, and may be produced by any animal possessing that organ; while speech or articulate language may be regarded as voice modified in the cavity of the mouth. The Larynx (q. v.) is the organ by which the so-called *vocal sounds* (or primary elements of speech) are produced. In the article **LARYNX**, it is shewn that there are two groups of muscles, which respectively govern (1) *the pitch of the notes*, and (2) *the aperture of the larynx*. Those which affect the pitch of the notes are divisible

into two antagonistic sub-groups, viz., (a) those which depress the front of the thyroid cartilage on the cricoid, and *stretch* the vocal ligaments; and (b) those which elevate the front of the thyroid cartilage, and *relax* the vocal ligaments; while those which control the aperture of the glottis are divisible into (c) those which *open* it, and (d) those which *close* it. It is only the first of these groups, viz., the muscles which stretch or relax the vocal ligaments, that is concerned in the production of voice. In the ordinary condition of rest, there is a wide opening between the vocal ligaments, which are in a state of complete relaxation, and the air passes freely between them. For our knowledge of the appearances presented under varying conditions by the interior of the larynx, we are mainly indebted to Professor Czermak, the inventor of the Laryngoscope (q. v.); and the reader who wishes to enter fully into this subject is referred to his work on that instrument, of which a translation was published by the New Sydenham Society in 1861. The three

figures, 1, 2, 3, represent respectively the condition of the larynx as seen during tranquil respiration, its condition during the emission of the broad vocal

Fig. 2.—Condition of the Larynx during the emission of the broad vowel sound A:

a, a, cartilages of Santorini, surmounting the arytenoid cartilages; *e*, epiglottis; *i.v.c*, inferior or true vocal cord; *s.v.c*, superior or false vocal cord of left side.

sound A, and its condition during the emission of a high or acute sound. The movements of the arytenoid cartilages during the production of vocal sounds

Fig. 3.—Condition of the Larynx during the emission of a high or acute sound:

e, epiglottis; *œ*, cushion of epiglottis; *i.v.c*, true vocal cord; *s.v.c*, false vocal cord.

can be distinctly seen—the views that had been previously deduced, from theory and experiments on the dead subject, being thus confirmed by ocular proof. As soon as we wish to utter a sound, the two arytenoid cartilages raise themselves in the fold of mucous membrane which covers them, and approach one another with surprising mobility. This movement effects the approximation of the

vocal cords, and consequently the contraction of the glottis (fig. 2). It is impossible to study with the laryngoscope the mode of formation of the gravest chest-sounds, because the arytenoid cartilages become so raised that they almost come in contact with one another, while they bend under the border of the depressed epiglottis, and thus conceal the interior of the larynx. During the emission of the most acute sounds, the glottis contracts into a mere line, on each side of which the vocal cords may be recognised by their whitish-yellow colour; while further outward, and separated from the former by a narrow groove, are the false or superior vocal cords of either side. The arytenoid cartilages are raised, and come in contact in the median line, the epiglottis is drawn outwards, and a short stiff tube is then formed above the glottis; all these parts being, as we learn from our sensations during the experiment, in a state of very great tension. Independently, however, of such observations as those we have recorded from Czermak's interesting Memoir, any one may easily prove for himself that the aperture of the glottis is much contracted during the production of sounds, by comparing the time occupied by an ordinary expiration with that required for the passage of the same quantity of air during the maintenance of a vocal sound; moreover, the size of the aperture varies with the note that is being produced, as may be readily seen by any one who compares the time during which he can hold out a low and high note. When the distance between the vocal cords exceeds one-tenth of an inch, no sound can be produced.

How the vocal cords produce sounds, is a question which has long attracted the attention of physiologists and physicists. To answer it, they were compared with various musical instruments. More than a century ago, Ferrein (*De la Formation de la Voix de l'Homme*, 1741) compared them to vibrating strings; and at first sight, there is an apparent analogy; but on further investigation (for reasons which may be found in Carpenter's *Human Physiology*, 6th ed., p. 715), this view was found to be untenable. The analogies between the organ of voice and the *flute-pipe*, in which the sound is produced by the vibration of an elastic column of air contained in a tube, were then investigated, but found to fail. The third class of instruments with which the human organ of voice has been compared are vibratory reeds or tongues, which may either possess elasticity in themselves, or be made elastic by tension. From the experiments of Weber, it appears that the action of the larynx has more analogy to that of reed-instruments than to the instruments previously named, and though there would seem at first sight to be a marked difference between the vocal ligaments and the membranous tongue of any reed-instrument, this difference is not very great. Müller ascertained that membranous tongues made elastic by tension may have three different forms, of which the following, which alone concerns us, is one: 'Two elastic membranes may be extended across the mouth of a short tube, each covering a portion of the opening, and having a chink left open between them.' Here there is clearly an approximation to the human glottis, which may be increased by prolonging the membranes in a direction parallel to that of the current of air, so that not merely their edges but their whole planes shall be thrown into vibration. Professor Willis has, upon this principle, invented an *artificial glottis*, in which the vocal ligaments are imitated by leather, or preferably by sheet india-rubber. It is composed of a wooden pipe of the form of fig. 4, *a*, having a foot, *C*, like that of an organ-pipe, and an upper opening, long and narrow, as at *B*, with a

point, *A*, rising at one end of it. A piece of leather or sheet india-rubber doubled round this point, and secured by being bound at *D* with strong thread, will form an artificial glottis, *b*, while its upper edges, *G*, *H*, are capable of vibrating or not by inclining

Fig. 4.

the planes of the edges. Two pieces of cork, *E* and *F*, are glued to the corners to make them more manageable. From this machine, various notes may be obtained by stretching the edges of the leather in the directions of their length, *G*, *H*; the scale of notes yielded by leather is much more limited than that yielded by india-rubber; and other observers have found that the middle coat of the arteries in a moist state (as being more elastic, and almost identical in structure with the vocal ligaments), yields more satisfactory results even than india-rubber. 'It is worthy of remark,' as Dr Carpenter observes, 'that in all such experiments it is found that the two membranes may be thrown into vibration, when inclined towards each other in various degrees, or even when they are in parallel planes, and their edges only approximate; but that the least inclination from each other (which is the position the vocal ligaments have during the ordinary state of the glottis) completely prevents any sonorous vibrations from being produced.'—*Op. cit.*, p. 718. The *pitch* of the notes produced by membranous tongues may be affected in various ways (as by increasing the strength of the blast, the addition of a pipe, &c.), and is mainly governed by their degree of tension, while the foregoing statements shew that the sound of the voice is the result of the vibrations of the vocal ligaments which take place according to the same laws with those of elastic tongues generally. Little is, however, known with certainty regarding the mode and degree in which the tones are modified by the shape of the air-passages generally, the force of the blast of air, and other circumstances.

The *false* *setto* is a peculiar modification of voice, differing from the ordinary or *chest voice*, not only in the higher pitch of the notes, but also in their quality. The theory of its production is still an open point, into which we have not space to enter, further than to remark that, according to Professor Wheatstone, false *setto* notes are to be explained by supposing that 'the column of air in the trachea may divide itself into *harmonic lengths*, and may produce a *reciprocation* of the tone given by the vocal ligaments.'

The pressure of the air within the trachea during the production of voice is very considerable. From observations made by Cagniard-Latour on a man with a fistulous opening in the trachea, it was found that when the patient called out

at the top of his voice, the pressure was equal to that of a column of water 38 inches in height; when he spoke at his usual pitch, to one of 5 inches; and when he sang in a high note, to one of about 8 inches. The glottis has been well chosen by Dr Carpenter to illustrate the minute precision with which the degree of muscular contraction can be adapted to the desired effect. The musical pitch of the tones produced by it is, as we have shewn, regulated by the degree of tension of the elastic vocal ligaments. Their average length, in a state of repose, is $\frac{1}{10}$ ths of an inch; while in the state of greatest tension, it is about $\frac{2}{10}$ ths—the difference being thus *one-fifth* of an inch; while in the female the respective lengths are $\frac{1}{10}$ ths and $\frac{1}{8}$ ths respectively—the difference being thus about *one-eighth* of an inch. Now, the natural compass of the voice, in persons who have cultivated the vocal organ, is about two octaves, or 24 semitones. Within each semitone, an ordinary singer could produce at least ten distinct intervals (the celebrated Madame Mara could sound 100 different intervals between each tone, the compass of her voice being 21 tones), so that 240 is a very moderate estimate of the number of different states of tension of the vocal cords, every one of which can be produced at will; and the whole variation in the length of the cord being not more than one-fifth of an inch, even in man, the variation required to pass from one interval to another will not be more than $\frac{1}{10}$ th of an inch (while in such a case as that of Madame Mara the distance would be reduced to $\frac{1}{17}$ th of an inch).

In the production of vocal sounds, the delicate adjustment of the muscles of the larynx, which is requisite to the evolution of determinate tones, is directed by the sense of hearing, being originally learned under the guidance of the sounds actually produced; but 'being subsequently effected voluntarily, in accordance with the mental conception of the tone to be uttered, which conception cannot be formed unless the sense of hearing has previously brought similar tones to the mind. Hence it is that persons who are born deaf are also dumb. They may have no malformation of the organs of speech, but they are incapable of uttering distinct vocal sounds, or musical tones, because they have not the guiding conception, or recalled sensation, of the nature of these. By long training, however, and by imitative efforts directed by muscular sensations in the larynx itself, some persons thus circumstanced have acquired the power of speech; but the want of a sufficiently definite control over the vocal muscles is always very evident in their use of the organ.'—*Op. cit.*, p. 556. A fund of interesting matter in connection with this subject may be found in Dr Kitto's *Lost Senses*. Although not born deaf, he became *completely* so in early childhood, in consequence of an accident. His voice became similar to that of a person born deaf and dumb, and taught to speak. It was observed that the words which he had been accustomed to use before his accident, were still pronounced as they had been in childhood, the muscular movements concerned in their production having been still guided by the original auditory conception, while all the words subsequently learned were pronounced according to the spelling.

The various muscular actions which are concerned in the production of vocal tones, are commonly regarded as being under the influence of the will. It is, however, easy to shew that this is not the case. We cannot, by simply *willing* to do so, raise or depress the larynx, or move one cartilage of it towards or from another, or extend or relax the vocal ligaments; although 'we can readily do any or all of these things by an act of the will, exerted

for a specific purpose. We conceive of a tone *to be* produced, and we *will* to produce it; a certain combination of the muscular actions of the larynx then takes place, in most exact accordance with one another, and the predetermined tone is the result. This anticipated or conceived sensation is the guide to the muscular movements, when as yet the utterance of the voice has not taken place; but while we are in the act of speaking or singing, the contractile actions are regulated by the present sensations, derived from the sounds as they are produced.' From these remarks, in which Dr Carpenter has placed a very difficult subject in as clear a light as the subject admits of, it follows that the muscular actions which are concerned in the production and regulation of the voice, are due to an *automatic* impulse, similar to what occurs in the movements of the eyeball, and in many other cases that might be adduced. There cannot be a doubt that the simple utterance of sounds is in itself an instinctive action; although the combination of these sounds into music or into articulate language, is a matter of acquirement.

Having explained the way in which the larynx produces those *tones* of which the voice fundamentally consists, and the sequence of which becomes *music*, we come to the subject of *speech*, which consists in the modification of the laryngeal tones by other organs superior and anterior to the larynx (as the tongue, the cavity of the fauces, the lips, teeth, and palate, with its velum and the uvula acting as a valve between the throat and nostrils), so as to produce those *articulate sounds* of which language is formed. The organ of voice is thus capable of forming a large number of simple sounds, which may be combined into groups, forming words. Vocal sounds are divided into vowels and consonants. When a vowel is pronounced, what happens? This question is thus answered by Professor Max Müller: 'Breath is emitted from the lungs, and some kind of tube is formed by the mouth, through which, as through a clarinet, the breath has to pass before it reaches the outer air. If, while the breath passes through the vocal cords, these elastic *laminae* are made to vibrate periodically, the number of their vibrations determines the pitch of our voice, but it has nothing to do with its *timbre*, or vowel. What we call vowels are neither more nor less than the qualities, or colours, or *timbres* of our voice, and these are determined by the form of the vibrations, which form, again, is determined by the form of the buccal tube.'—*Lectures on the Science of Language*, 2d series, p. 116. This writer enters very fully into the various configurations of the mouth requisite for the formation of the different vowels. (1.) In pronouncing *u* (the vowels are all understood to be pronounced as in Italian), we round the lips, and draw down the tongue, so that the cavity of the mouth assumes the shape of a bottle without a neck. (2.) If the lips are opened somewhat wider, and the tongue be somewhat raised, we hear the *o*. (3.) If the lips are less rounded, and the tongue somewhat depressed, we hear the *a* of the northern languages (as in *august*). (4.) If the lips are wide open, and the tongue in its natural flat position, we hear *a*. (5.) If the lips are fairly open, and the back of the tongue raised towards the palate, the larynx being raised at the same time, we hear the sound *e*. (6.) If we raise the tongue higher still, and narrow the lips, we hear *i*. The buccal tube here represents a bottle with a very narrow neck, of no more than six centimetres (or about two inches and a quarter) from palate to lips. Diphthongs arise when, instead of pronouncing one vowel directly after another with two efforts of the voice, we produce a sound

during the change from one position to the other, that would be required for each vowel. Though the tube of the mouth thus modified by the tongue and lips is the chief agent in the production of vowels, Czermak has proved that the *velum palati* is changed in position with each vowel, and that it is lowest for *a*, and rises successively with *e*, *o*, *u*, and *i*, when it reaches its highest point. He likewise found that the cavity of the nose is more or less opened during the pronunciation of certain vowels. Languages might have been formed entirely of vowels, but the existing words, consisting solely of vowels, shew how unpleasant such languages would have been. Something else was obviously wanted to supply what Max Müller happily terms the *bones of language*—namely, the consonants. These are commonly divided into (1) those which require a total stoppage of the breath at the moment previous to their being produced, and which cannot, therefore, be prolonged; and (2) those in pronouncing which the interruption is partial, and which, like the vowel sounds, can be prolonged at pleasure. The former are termed *explosive*, and the latter *continuous*, consonants. In pronouncing the *explosive* consonants, the posterior openings of the nostrils are completely closed, so as to prevent the passage of air through the nose, and the current may be checked in the mouth in three ways—viz. (a) by the approximation of the lips; (b) by the approximation of the point of the tongue to the front of the palate; and (c) by the approximation of the middle of the tongue to the arch of the palate. The letters *b* and *p* are pronounced by the first of these modes; *d* and *t* by the second; and *g* (hard) and *k*, sounded as *key*, by the third; the difference between *b*, *d*, and *g*, on the one hand, and *p*, *t*, and *k*, depends upon the approximating surfaces being larger, and the breath being sent through them more strongly at the moment of opening in the former than in the latter group. The *continuous* consonants may be subdivided into three classes, according to the degree of freedom with which the air is allowed to escape, and the compression which it consequently experiences. In the *first* class, no air passes through the nose, and the parts of the mouth that produce the sound are closely approximated, so that the compression is considerable. This is the case with *v* and *f*, *z* and *s*, *d* and *t*, *th*, *sh*, &c., the movement of the tongue being also concerned in the production of several of these sounds. In the *second* class, including *m*, *n*, *l*, *r*, the nostrils are not closed, and consequently, the air is scarcely at all compressed. In pronouncing *m* and *n*, the breath passes through the nose alone; *m* is a labial, like *b*, but the latter is formed with the nose closed. Hence the passage of *m* to *b* (as in *lamb*) is easy; so also is that from *n* to *t*, or from *n* to *g*, as is seen in the frequent combination of *nt* and *ng* in most languages. The sounds of *l* and *r* (letters which Max Müller places in a special group under the name of Trills) are produced, according to Helmholtz, as follows: 'In pronouncing *r*, the stream of air is periodically entirely interrupted by the trembling of the soft palate, or of the tip of the tongue, and we then get an intermittent noise, the peculiar jarring quality of which is produced by these very intermissions. In pronouncing *l*, the moving soft lateral edges of the tongue produce, not entire interruptions, but oscillations in the force of air.'—*Die Lehre von den Tonempfindungen*, 1863, p. 116. The *third* class contains sounds which scarcely deserve to be called consonants, since they are merely *aspirations*, either simple, or modified by an elevation of the tongue, causing a slight obstruction to the passage of air, and an increased resonance in the back of the mouth. The present *A* and the

Greek *χ* are examples of these sounds. The method of pronouncing these sounds is very fully discussed in Max Müller's Lectures, 2d Series, pp. 127—136.

For further details, the reader is referred to the admirable chapter on 'Voice and Speech' in Carpenter's *Human Physiology*, and to Max Müller's *Lectures on the Science of Language* (from both of which we have borrowed largely in this article), to Mr Bishop's article 'Voice' in the *Cyclopædia of Anatomy and Physiology*; and the various works of Funke, Helmholtz, Brücke, Czermak, Du Bois Raymond, &c. mentioned by Max Müller in his chapter on 'the Physiological Alphabet.'

VOIDED, in Heraldry, a term applied to an ordinary when its central area is removed, so that the field is seen through it, and little but a mere outline remains, as in the example No. 1.—Azure, a saltire voided argent. When the ordinary has its outer edge formed of any of the lines of partition

Voided.

other than dancetté, wavy, or nebuly, the voiding is nevertheless plain, as in No. 2.—Azure, a chevron engrailed voided or. An ordinary voided and coupé differs from an ordinary coupé and voided in so far as the former is open at the extremities, and the latter enclosed. One ordinary may sometimes be voided in the form of another, as a cross voided per pale in the example No. 3.

VOIRE DIRE (*veritatem dicere*). In English Law, when a witness is supposed to be liable to objection for incompetency or otherwise, he is first sworn, not in the cause, but on the *voirs dire*, that is, to answer questions relating to this incompetency; and if it is apparent that he is incompetent, he is discharged without further examination.

VOIRON, a town of France, in the dep. of Isère, beautifully situated on the Morge, 15 miles by railway north-west of Grenoble. Among the manufactures which are here carried on with great activity are to be mentioned blacksmiths' work, paper-making, nail-making, and tanning. Pop. (1861) 9600.

VOLANT, in Heraldry, flying. A bird volant is represented flying bendways towards the dexter side of the shield; and its position may be distinguished from that of a bird rising by the legs being drawn up towards the body.

VOLCANOES are conical mountains which vomit flame and smoke, and occasionally throw out showers of ashes and stones, or eject melted rock on the surface of the earth. Volcanoes may have their origin on flat plains on the surface of the earth, or even at the bottom of the sea; but the gradual accumulation of the ejected material around the vent, through which it has been poured, forms in time a mountain, if it is allowed to remain. The waves swept away the cone of Grahame's Island (q. v.), which in 1831 appeared in the Mediterranean, scattering the lava and scories of which it was composed at the bottom of the sea. When, however, the ejected materials are sufficiently compact to resist the action of the waves, a permanent island is produced, and sometimes increases in height with a rapidity that can scarcely be imagined. In 1796, a volume of smoke was seen to rise from the Pacific

Ocean about 30 miles to the north of Unalaska. The ejected materials having raised the crater above the level of the water, flames issued from the islet, which illuminated the country for 10 miles around. Six years afterwards, when a few hunters landed on the new island, they found the soil in some places so hot that they could not walk upon it. Repeated eruptions have increased the dimensions of the island, until now it is several thousand feet in height, and between two and three miles in circumference. In the same region is the volcanic island of Kliutschewsk, which rises at once from the sea to the enormous height of 15,000 feet.

The lava, scoria, and ashes which are thrust out of the crater form highly inclined and more or less regular beds on the surface of the mountain, extending from the crater-mouth to varying distances down the sides of the volcano. This method of increase gives the uniform conical outline to volcanoes, without the terraces or breaks which are found in almost all other mountains. The sides are often furrowed longitudinally by straight narrow ravines, which increase in number towards the base. These are produced by the action of running water obtained from rain or from melting snows during an eruption. The rapidity with which floods rush down the steep sides of a volcano gives a prodigious force, which the loose scoria and ashes, and even the solid lava, cannot resist.

The grayish colour of volcanic mountains is produced by the ash and scoria, which, though in composition the same as the dark lava, have this lighter colour from the minute subdivision of their particles. When a particular series of rocks remain on the surface, and are not covered by the products of more recent eruptions, they weather and decompose, and produce a very fertile soil, which is speedily clothed with vegetation, and thus change the whole aspect of the formerly bare and uniformly-coloured mountain.

The vent through which the materials are vomited forth is called the crater. This is a more or less circular opening, communicating with the source from which the ejected materials are obtained. The crater has generally one side much lower than the other—that from which the prevailing wind blows, which carries with it the showers of ashes to the opposite side of the mountain. In many cases, the cone is truncated; a wide hollow of immense extent, and often of great depth, in the base of which the crater is situated, occupies the summit. The Spanish name *Caldera* is technically applied to these hollows. Their origin has been a subject of considerable controversy. Von Buch and others maintain that they are craters of elevation; that is, that the rocks were originally spread out in nearly horizontal deposits, and then upheaved into a dome-shaped mountain, with the hollow caldera in the centre of its summit. The more satisfactory explanation is that the original cone, formed by the alternate deposition of the lava and ashes ejected from the crater, has, from the great heat of the molten lava rising in the tube of the volcano, or from gaseous explosions, given way, and fallen in. The cones both of Etna and Vesuvius have frequently fallen in and been reproduced. In 1822, the summit of Vesuvius was reduced by 800 feet. The immense size of some calderas seems, however, opposed to this theory. That of the island of Palma, one of the Canaries, is from three to four geographical miles in diameter, and the precipices which surround the cavity are from 1500 to 2000 feet in vertical height. They form an unbroken wall, except at the south-western end, where a deep gorge permits the passage of the torrent which drains the caldera. The precipices are traversed by numerous vertical dikes, and exhibit all

the appearances which would be produced by the falling-in of the huge summit of this once enormous volcano.

The pressure of the incandescent lava often forces for itself a passage to the surface before it reaches the mouth of the crater, and this is more frequently the case when the volcanic eruption is accompanied with earthquakes. Immense vertical fissures are found radiating from the centre of the volcanic action, and reaching the surface of the ground, and even rising to the summit of the mountain; these being filled with the molten rock, which in course of time solidifies and forms often a large portion of the mountain mass, as is shewn in the *Val del Bové* on Etna (q. v.). The lava sometimes pours out of these fissures instead of rising to the crater. In 1783, during a terrible eruption of Hecla, a prodigious stream of lava flowed from a lateral crevice; moving slowly down the mountain-side, it reached a distance of 50 miles in 42 days; it then branched into two main streams, the one running 40 miles, and the other 50 miles further towards the sea. Its depth varied from 600 to 1000 feet, and its greatest width was 15 miles. The amount of lava poured out into this stream would almost equal Mont Blanc in bulk.

The power which exhausts itself in the eruption of a volcano often shews itself by changes which it produces in the level of the country around. About a hundred years ago, a volcano appeared in the centre of the great table-land of Mexico, and raised an area of nearly four square miles 550 feet higher than it was before, covering it at the same time with conical hills of various heights, the highest of which is *Jorulla*, which is 1600 feet high. But sometimes a subsidence takes place. In 1772, a great part of the *Papandayang*, a mountain in Java, was swallowed up; the inhabitants of its declivities were suddenly alarmed by tremendous noises in the earth, and before they had time to retire, the mountain began to subside, and soon disappeared. The area thus sunk was 15 miles long and 6 broad.

A volcanic eruption is generally preceded by rumbling noises and slight movements in the earth; then fitful puffs of gases and steam are given off. These contain much sulphur; and some volcanoes give out such quantities of carbonic acid and other mephitic gases as to destroy the animals in the neighbourhood. Sir William Hamilton picked up dead birds on Vesuvius during an eruption; in 1730, all the cattle in the island of *Lancrota*, one of the Canaries, were destroyed by these deleterious emanations. The *Upas Valley* in Java contains an extinct crater; and the certain death which overtakes every animal that penetrates the valley, is due to the noxious gases given out from it, and not to the *Antiaris*, which, though yielding a deadly poison, does not affect the atmosphere in which it grows. The eruption itself begins, perhaps, with the ejection of the finest dust, and that with such a force as to project it high into the atmosphere, where, taken up by air-currents, it is often carried to enormous distances. In 1845, the dust from Hecla was in ten hours thickly deposited on some of the Orkney and Shetland Islands: the ashes from *Consequina* fell, in 1835, on the streets of Kingston, Jamaica, at a distance of 700 miles; and during the same eruption, the fine dust covered the ground at a distance of nearly 30 miles to the south of the volcano, to a depth of more than 10 feet, destroying the woods and dwellings, and enveloping thousands of quadrupeds and birds.

The flames seen issuing from the crater are usually the reflection of the glowing lava emitted from the crater, and illuminating the clouds of vapour, scoria, and ashes.

Lava and scoriae are at last vomited forth. Sir William Hamilton says that, in 1779, the jets of liquid lava from Vesuvius, mixed with scoriae and stones, were thrown to a height of 10,000 feet, giving the appearance of a column of fire. The lava, however, generally issues from openings in the side of the mountain. It pours forth in a perfectly liquid state, bright and glowing with the splendour of the sun. At first, it flows rapidly; but as its surface becomes cooled and converted into slag, its velocity diminishes. It has to burst the indurated coating before it can continue its progress, and the liberated lava when it flows bears on its surface masses of scoriae, looking like the slag from an iron furnace.

The materials ejected from a volcano, though differing greatly in appearance, have the same mineral composition. The ash is merely the pumice in a very fine state of division, and the pumice also is only lava made vesicular from contact with air or water.

The theories propounded to account for volcanic action are either chemical or geological. Sir H. Davy suggested that if immense quantities of the metallic bases of the earths and alkalis were present in the interior of the earth, all the phenomena would be produced by their oxidisation from contact with air or water. Although the distinguished author of this theory abandoned it, it has since been taken up and advocated by Daubeny and others. Bischof, assuming that the interior of the earth consists of a highly heated and fused mass, considers that the mechanical action of water, converted into steam by the great heat, would produce volcanic action. Both theorists seek support for their views from the fact, that the great majority of volcanoes are situated on or near the sea-coast. Geologists accepting also the doctrine of internal heat, and believing that at a depth variously estimated—by some as low as 10 miles, and by others as high as 25 miles—the rocks of the earth are in a state of fusion, explain volcanoes by considering them as connections established between the interior of the earth and the atmosphere; and Darwin, from observations made in all parts of the world, believes that volcanoes are chiefly, and, indeed, almost only found in those areas where subterranean motive-power has lately forced, or is now forcing upwards the crust of the earth, and are invariably absent in those where the surface has lately subsided, or is still subsiding.

Volcanic action is limited to particular regions of the earth. In these regions, the active vents are distributed at intervals, and are generally arranged in a linear direction. The Pacific Ocean is bounded by an almost unbroken line of active volcanoes. Beginning in the New South Shetlands, where there is an active volcano in lat. 62° 55' S., we pass to Tierra del Fuego, and then on to the Andes, which are throughout their whole course volcanic, although the great centres of present action are confined to Chili, Peru, the neighbourhood of Quito, Guatemala, and Mexico. The line is continued northwards by the burning mountains of North-western America, and the Aleutian Islands carry the chain across to Kamtchatka on the Asiatic side. Here turning southwards, the line may be traced through the Kurile Islands, Japan, Formosa, the Philippines, Moluccas, New Guinea, and the Salomon and New Hebrides groups, to New Zealand. From Celebes, a branch proceeds in a north-westerly direction through Java and Sumatra, to Barren Island in the Bay of Bengal; and even beyond this we find a region in Northern India subject to earthquakes, which may lead us, on the one hand, to the volcanic region in Tartary, or, on the other, through Asia Minor to the Greek Archipelago, Sicily, Naples, and

on to the Canaries and Cape de Verdes. According to the geological theory, the lines thus traced over the globe would represent rising lands, where the crust is less strong, and so less liable to repress the expansive powers below. There are a number of isolated volcanoes also scattered over the surface of the earth; these are supposed to have opened a star-shaped communication with the interior. The most remarkable of these isolated volcanoes are Jan Meyen, in lat. 70° 49' N.; and those in Iceland in the north, and Mount Erebus in South Polarland, in lat. 77° 32' S.

VOLE (*Arvicola*), a genus of rodent quadrupeds, of a group which some naturalists constitute into a family (*Arvicolidae*), but which is more generally regarded as a tribe or sub-family of *Muridae* (q. v.). This group is characterised by a thicker and shorter form than that of the true rats and mice; an obtuse muzzle; ears of moderate size; a round and hairy tail, not so long as the body; the molar teeth with flat crowns, which present angular enamelled plates. These characters exhibit an approach to the Beaver family (*Castoridae*). The Lemmings (q. v.) belong to this group. The species are numerous, and widely distributed, being found in Europe, Asia, Africa, and North and South America. Some of them are completely terrestrial in their habits, others are aquatic. Many are popularly called rats and mice, as the species of the genus *Arvicola*, which are found in Britain. In this genus, the teeth are only ten in number; two incisors and three molars in each jaw. One of the most common British species is the FIELD V. (*A. agrestis*), also known as the MEADOW MOUSE and SHORT-TAILED FIELD MOUSE. The whole length of the head and body is scarcely more than four inches, that of the tail rather more than an inch and a quarter. The Field V. has a large head, a very obtuse muzzle, ears just appearing above the fur, the thumb of the fore-feet rudimentary, and without a claw. The upper parts are reddish brown, the under parts ash-colour, the feet and tail dusky. It burrows in the ground, or finds a retreat for itself in the excavations of some other animal, as of the mole. It chiefly inhabits low and damp situations, and dry seasons are very fatal to it. It produces from five to seven young at a birth. It is sometimes very injurious to plantations, by destroying the roots of trees and devouring their bark. Excessive numbers of this little animal were regarded in 1813 and 1814 as threatening the destruction of the Forest of Dean, and the New Forest in Hampshire; and many trees were killed; but a remedy was found in digging pits into which the voles fell, and from which they could not escape. The same method has been successfully employed in some of the forests of continental Europe. This species of V. is found in most parts of Europe, and in many parts of Asia. It is common in the Himalaya.—Another very common British species is the WATER V. (*A. amphibia*), popularly known as the WATER RAT, a much larger animal, the head and body being about 8½ inches in length, and the tail 4½ inches. The head is thick and short, the muzzle very obtuse, the eyes small, the ears scarcely seen beyond the fur; the last joint only of the thumb of the fore-feet conspicuous beyond the skin. The fur is thick and shining, of a rich reddish brown mixed with gray above, yellowish gray beneath. Although the feet are not webbed, the Water V. swims extremely well, and not only at the surface of the water, but often under it. It burrows in the banks of streams, ditches, and ponds. Its food appears to consist chiefly of aquatic plants, although it objects to no kind of vegetable food, and has been known to store up potatoes in its burrow for winter. It has been supposed also to feed on worms.

frogs, and small aquatic animals, and to be destructive to the spawn of fish; but this is very doubtful. This species is widely diffused over the continent of

Water Vole (*Arvicola amphibia*).

Europe. There is a black variety of it, common in some parts both of England and Scotland, which has been described as a distinct species (*A. atra*). Several species of *V.* are found in North America.

VOLGA, the most important river of Russia, and the longest in Europe, has its origin in a marshy plain among the Valdai Hills, in the government of Tver; lat. 57° N., long. 33° 10' E. From its source, which is 550 feet above ordinary sea-level, and 633 feet above the level of the Caspian Sea, into which it falls, the river flows south-east to Zubzov, then north-east past Tver and Koliazin to Mologa, where it turns east-south-east, and flows in that direction past Jaroslav, Kostroma, Nijni-Novgorod, and Kazan, 50 miles below which, on receiving the Kama, it turns south, passing Simbirsk, Stavropol, and Samara. Here its course again changes to south-west, and in this direction the river flows until it reaches Tzaritzin, when it bends to the south-east, and reaches the Caspian Sea, which it enters by many mouths, and after a course of 2320 miles. The *V.* waters 9 governments—those of Tver, Jaroslav, Kostroma, Nijni-Novgorod, Kazan, Simbirsk, Saratov, Samara, and Astrakhan; but besides these, 12 other governments are watered by its tributaries. The course of the stream is generally divided into three parts—the upper part reaching from its source to its confluence with the Szekana, and, though presenting many hindrances to navigation, yet capable of being traversed from Tver to Rybinsk by craft of 1½ and 2 feet draught; the middle part, from Rybinsk in Jaroslav to Nijni-Novgorod, navigable for larger craft; and the lower *V.* from Nijni-Novgorod to Astrakhan—where it is about 90 feet deep—navigable for the largest vessels. Below Astrakhan, the *V.* is very much shallower—in some places only 1½ feet deep. At Tver, the breadth of the river is 720 feet; at Mologa, 2060 feet; at Nijni-Novgorod, 2069 feet, but sometimes in the spring 2½ miles broad; at Simbirsk, about a mile broad; between Samara and Sysran, from 1 to 3 miles broad. Below Tzaritzin, at the confluence of the Sarpa, the river affords few facilities for navigation, and is remarkable for the number of branches into which it divides itself before it enters the Caspian Sea. The banks of the *V.*, which are elevated in the upper and middle reaches, become much lower as the river approaches its embouchure. The chief ferries and commercial towns on the *V.* are: Rjev, Zubzov, Tver, Koliazin, Uglitch, Mologa, Rybinsk (the great centre of the corn-trade), Jaroslav, Kostroma, Nijni-Novgorod, Kazan, Simbirsk, Samara, Tzaritzin, and Astrakhan. The system of water-communication established by the *V.* and its tributaries, is of the greatest importance to the

commerce of Russia, connecting as it does the central districts of the country with the White Sea by means of the canal of the Prince of Wurtemberg; with the Baltic by the three canal-systems of Tichvin, Viadni-Volotchek, and Mariinsk; with the Black Sea by the Upa Canal, which connects the Oka and the Don; with the Caspian Sea by the great stream of the *V.* itself; and with Siberia by the rivers Kama and Tchussovaia. The principal affluents on the right are the Oka (q. v.) and the Sura; on the left, the Tvertza, Mologa, Szeksna, and Kama (q. v.).

VOLHYNIA, a frontier government of West Russia, bounded on the S.-W. by Galicia, and on the W. by Poland, from which it is separated by the river Bug. Area, 27,348 sq. m.; pop. (1866) 1,577,000, mostly Russians, Poles, Lithuanians, Jews, Germans, and Tartars. The surface in the north of the government is low; and plains and morasses, covered with forests, abound; in the south, there are hills, branches of the Carpathian Mountains, but which do not rise higher than 1230 feet. Almost all the rivers flow north, and join the Pripet, an affluent of the Dnieper; a few streams, however, flow west, and join the Bug, by means of which river timber is floated down from this river to Prussia. The soil is sandy or clayey; agriculture flourishes in the south, and corn is exported to Odessa, Galicia, Poland, and partly to Great Russia. Cattle-breeding has always been a prosperous branch of industry in *V.* until recently, but a fine breed of sheep are still reared, and the government possesses the finest studs in the empire—those of the Princes Sangousko and Tzartorisky. Of the woods, which form the principal riches of the north districts, fir is the chief. The forests abound in foxes, hares, and bears, and hunting is a favourite pastime. Many sugar-mills, cloth-factories, and distilleries are in operation, and the manufactures are increasing yearly. Corn, cattle, sheep, wool, cloth, linen, timber, honey, and wax are the principal articles of trade.

V. in early times belonged to the ancient Russians, but was conquered by the Lithuanians and Poles in 1320, and remained in their hands till its annexation to Russia in 1798.

VOLITION. See WILL.

VOLLEY, the simultaneous discharge of a number of small-arms. The same operation from cannon is called a salvo.

VOLNEY, CONSTANTIN FRANÇOIS CHASSEBOEUF, COMTE DE, was born at Craon, in Anjou, on the 3d of February 1757. He was the son of an advocate of good reputation. His family name was Chasseboeuf, but on arriving at manhood he assumed the additional surname of Volney. He got his preliminary education at the colleges of Ancenis and Angers, and afterwards went through a protracted course of study at the university of Paris. His father wishing him to join his own profession, he spent some time in preparing for the bar; but he renounced law for medicine, which, however, he never practised. He had inherited a competency from his mother, and, soon after completing his studies, in the year 1783, he set out for Egypt, with the intention of travelling in Egypt and Syria. This expedition occupied him about four years. On his return to France in 1787, he published his celebrated *Travels in Syria and Egypt*, which still contain the most trustworthy as well as one of the liveliest and most interesting accounts which have been published of the tribes with which he came in contact. This work at once procured him a great reputation. At first, there was a disposition to question the veracity of some of his descriptions; but their truthfulness was fully confirmed when the French became more familiar with the Egyptians and the Arabs through

the expedition of 1796. The sagacity of the chief political conclusions to which his residence among these peoples had brought him, which in 1788 he embodied in a pamphlet—*Considerations on the War between the Turks and the Russians*—has also been shewn by subsequent events. In 1790 he was elected to the États Généraux, as a member for his native district, and took a somewhat prominent part in the political discussions of the years which followed, shewing himself, as he has done in his works, a fast friend of the public liberties, a mocker at all systems of religion, and at the same time a fearless opponent of popular excesses. He was imprisoned for his outspokenness in 1793, and was not liberated till after the downfall of Robespierre, in July of the following year.

In September 1794, V. published his *Ruins; Reflections upon the Revolutions of Empires*, upon which, and upon his *Travels*, his reputation chiefly rests. V. believed that political, like all other organisations, are subject to decay and destruction. The discussions contained in the *Ruins* cover almost all the radical questions in politics. Its principles are those of 1789. It vindicates the doctrine of the rights of man, establishes the duty of toleration in matters of opinion, and maintains, with perhaps too much of sarcasm and mockery, the human origin and the essential falsity of all religious systems. In the previous year, V. had published his *Natural Law*, a catechism for a French 'citizen,' in which he treats morality as a physical and material science, to be studied upon the same methods as the other natural sciences, and having no object but the conservation and improvement of society. This work was afterwards republished under the title of the *Physical Principles of Morality*.

Towards the close of 1794, he was appointed Professor of History in the short-lived Ecole Normale; and the brilliant discourses, not untinted with paradox, which he delivered in this capacity, made a sensation in Paris even at that unsettled time. On the suppression of the Ecole Normale in 1795, he went to the United States, intending to spend the remainder of his days there; but circumstances made his residence there extremely disagreeable to him, and he returned to France in the spring of 1796. In his absence, he had been elected a member of the Institute; he was, soon after his return, admitted to the Academy; and henceforth his life, though not inactive, was prosperous and untroubled. He had early been acquainted with Bonaparte, and had been of service to him at the time when political circumstances had deprived him of employment; and Bonaparte, on becoming First Consul, desired to associate him with himself in the government as consul or as Minister of the Interior. V. refused both offices, but accepted a seat in the Senate. He protested against the establishment of the Empire, and resigned his seat in the Senate; but his resignation was declined; and during the existence of the Empire he formed one of the little band, sneered at by Napoleon as *idéologues*, who in the Senate attempted by their criticisms to restrain the arbitrary conduct of the emperor. Henceforth, however, his occupations were mostly literary. He published *Researches into Ancient History*, several of the papers contained in which were written in the earlier part of his career; and also several linguistic works, in which he attempted to popularise, and, by means of a universal alphabet, to simplify the study of the eastern languages. He had accepted from Napoleon the title of Count, and the commandership of the Legion of Honour; and upon Napoleon's downfall he was among those who were called to the House of Peers by Louis XVIII. His latest work, published in 1819, was *The History of Samuel*, the

Inventor of the Sacredness of Kings. V. died on the 25th April 1820, shortly after completing his 63d year.

VOLOGDA, an extensive government of Great Russia, bounded on the E. by the Ural Mountains, and on the N.-W. by the government of Archangel. Area, 151,500 sq. m.; pop. (1866) 961,000, chiefly Russians, but comprising also a few Finns, by which race this territory was inhabited in early times. The districts in the east, adjoining the Ural Mountains, are traversed by branches of that chain, which rise to the height of from 3000 to 4000 feet. But by far the greater part of the government is occupied by marshy plains, covered with impenetrable forests. The soil is not fertile, except in the south-west districts, which are the most densely peopled, and produce corn sufficient for local consumption and the supply of the distilleries. In the middle districts, there are comparatively few inhabitants; cultivated land is rarely seen, and hemp is the only crop produced liberally. The wooded morasses of the north are inhabited only by Finnish tribes, engaged in hunting. The banks of the rivers are, as a rule, the only inhabited places. The principal rivers, fifteen of which are navigable, are the Northern Dwina, with its great upper waters, the Suchona, Jug, and Withegda; and the Petchora, with its affluents. Lakes are numerous. Salt-works, iron-works, and distilleries are in operation; and salt, iron, skins, tallow-candles, and cheese are exported; and corn and manufactured goods imported.

VOLOGDA, a city of Great Russia, in the south-west angle of the government of the same name, of which it is capital, stands on both banks of the river Vologda, 467 miles east of St Petersburg. It is said to have been founded in the 13th c. by settlers from Novgorod, to which principality it belonged down to the 15th c., when it was annexed to Moscow. In 1553, when England opened up a trade with Russia, through the port of Archangel, V. was the great entrepôt for goods deported north by the Northern Dwina; and even yet (1866), it exports to St Petersburg and Archangel various products of its own and neighbouring governments, to a considerable amount. Nigello and filigree work are manufactured. Pop. (1866) 18,984.

VO'LSOI, an ancient Italian people, closely related to the Umbrians. See UMBRIA. Their territory was bounded on the W. by that of the Latini, on the N. they marched with the Æqui and Hernici, on the E. with the Samnites, and on the S. they had the sea. Along nearly the whole of their coast lay the Pontine Marshes, while, inland, their territory was somewhat mountainous. The V. were a brave and warlike people, who, frequently in alliance with the Æqui, were incessantly at war with the Romans for upwards of 200 years previous to 338 B. C., about which time they appear to have been finally subdued, their territory incorporated into Latium, and they themselves created Roman citizens. See LATINI. These wars were very harassing to the Romans, as they were often carried on not so much by the V. as a whole, as by different cities, each frequently on its own account. Some of the chief towns, and those which took a principal part in the wars, were Antium, Valitræ, Satricum, Privernum, Ulubra, Sueasa Pometia, Anxur, and Tarracina, and later Forum Appii and Tres Tabernæ. The legend of Coriolanus (q. v.) is connected with the Volscian wars. See ROME, TARKVINIUS SUPERBUS, ANTIUM. From the time of their final subjugation, their history belongs to that of Rome (q. v.).

VOLSK, or VOLGSK, a town of European Russia, in the government of Saratov, on the right

bank of the Volga, 80 miles north-east of Saratov. Fat and skins are prepared and exported to St Petersburg, and corn is exported in large quantities to Astrakhan and Rybinsk. The inhabitants are chiefly engaged in the culture of gardens and orchards, and the fruits grown are exported principally to Nijni-Novgorod. Pop. 24,345.

VOLTA, ALESSANDRO, a celebrated Italian physicist, was born at Como, of a noble family, in 1745, and received an excellent education. In 1774, he was appointed Professor of Natural Philosophy at Pavia, and continued to discharge the duties of this chair till 1804, when he retired to his native town, to spend the rest of his days. V., while but a youth, had exhibited considerable taste for letters, and had even written two poems, one in Italian, and the other in Latin; but as he grew older, he abandoned all such pursuits, and devoted himself exclusively to the sciences, especially those connected with electricity. At intervals between 1777 and 1782, he visited Switzerland, Tuscany, Germany, Holland, France, and England, making the acquaintance of the most eminent philosophers of these countries; and on his return is said to have introduced the culture of the potato into Lombardy. In 1796, he was one of a deputation sent to solicit the forbearance of Napoleon; and was received with distinction by the French general, who afterwards invited him to Paris, to exhibit, to the members of the Institute, the action of the 'pile' (see GALVANISM), which he had invented, enrolled him in the Legion of Honour, and conferred on him the order of the Iron Crown, with the titles of Count and Senator of the Kingdom of Italy. He was also elected (1801) a Foreign Associate of the French Institute, ten years after he had been made a Fellow of the Royal Society of London. He died at Como, March 5, 1826. V.'s contributions to the science of electricity are of great importance, the chief of them being his theory, in opposition to the 'animal-electricity' doctrine of Galvani, that the electric power resides in the metals; although, in turn, he fell into the error of supposing that the chemical action of the different kinds of metal on each other was only incidental. He also invented an electric battery, consisting of a series of cups arranged in a circle, each cup containing a saline solution, in which were immersed, edgewise, two plates, one of zinc and the other of silver, the zinc plate in one cup being connected with the silver one in the next by means of a wire. This battery was, however, soon after superseded by his 'pile.' He also invented, in 1775, the *Electrophorus* (q. v.); in 1782, the electrical *Condenser* (q. v.), employing with it an electrometer (see ELECTRICITY), in which two straws were employed instead of the gold-leaf strips now in use; and also (1777) the hydrogen-lamp, and the electrical pistol. Most of his important discoveries were communicated by him directly to the Royal Society in the form of Memoirs, which were published in the *Philosophical Transactions* (1782, 1783, 1800); and the Copley Medal was awarded to him in 1794.—A collection of V.'s works was published in 1816 at Florence, under the title of *Collezione delle Opere, &c.*, in 5 vols. 8vo.

VOLTAIRE (FRANÇOIS-MARIE AROUET, his true name)—one of the most famous of French writers—was born, according to his own account, as given in later life, on 20th February 1694, at Chatenay, near Soeaux. The register of his baptism, however, assigns Paris as the place of his birth, and dates it 21st November of that year. As to which of these statements may be really the correct one, his biographers are not yet fully agreed. His father was François Arouet, a notary of the Châtelet, ultimately

Treasurer of the Chamber of Accounts; his mother, Marguerite D'Aumar, of a noble family of Poitou. Of two sons born to them, François was the younger. He received his education at the College of Louis le Grand in Paris; and on its completion, he was set to study law by his father. But he found this pursuit too disgusting, and speedily quitted it for the career of a man of letters. By his godfather, the Abbé de Châteauneuf, who was very intimate with her, he was introduced to the celebrated Ninon de l'Enclos, and through her to the best French society of the period. In these wicked and witty circles, being himself deficient in neither wickedness nor wit, the young man prospered extremely; and so perfectly unexceptionable was the company in which he found himself, that one day he could exclaim, looking round the table with complacency: 'Are we all, then, either princes or poets?' His father, however, deeply disapproving of the life he led as immoral, and probably not inexpensive, had him sent to Holland with an embassy. Here he became involved in a love-affair of the more respectable kind, which ended, not in marriage, as he seems to have proposed, but in his being sent back to Paris, to resume his gay career. Shortly, it suffered another interruption: on suspicion (unfounded) of his being the author of some satirical verses, reflecting on the government of Louis XIV., then just dead, he was sent to the Bastille (May 17, 1717), where he remained upwards of a year. This time of imprisonment he improved by sketching his famous poem, afterwards published as the *Henriade*, and by finishing his tragedy, *Edipe*, which was produced on the 18th November 1718, and had so great a success with the public, as not only to delight the author, but somewhat to mollify his old parent, who began to surmise that the despised 'poetry' of his offspring was not unlikely to come to something. The same success did not, however, attend his next ventures: his tragedy, *Artémire*, produced in 1720, was hissed off the stage; and his *Mariamne*, which followed in 1724, fared but little better. Meantime, he had again visited Holland, making, on the way, the acquaintance of Jean Baptiste Rousseau, a poet of some importance, then living at Brussels. The two geniuses met as friends, only to part as irreconcilable enemies. Their quarrel is said to have originated in a characteristic *mot* of V., who, his critical opinion being asked of an *Ode à la Postérité*, which Rousseau read to him, had the candour to reply thus: 'Mon ami, voilà une lettre qui n'arrivera jamais à son adresse.' In the summer of 1725 occurred a misadventure, which, for V., had important consequences. At the dinner-table of the Duke de Sulli, he resented with spirit an affront put upon him by the Chevalier de Rohan, who, worsted in the war of wit, as most men were likely to find themselves with V., avenged himself some days after by having his adversary thrashed in public by footmen. Subjected to so gross an outrage, V. retired for a time into private life, assiduously perfected himself in the small-sword exercise, and then courteously entreated the Chevalier to a meeting in the *duello*. The Chevalier, as it proved, had small stomach for the encounter; having immortalised himself sufficiently by his insult to the poet, he considered it unnecessary to aspire to the further immortality of being killed by him. Under superficial pretences of accepting the challenge, his practical answer to it came in the form of a *lettre de cachet*, which consigned V. once more to the Bastille. His imprisonment was not on this occasion a long one; but it was only under sentence of exile that he was permitted to issue from durance; and on doing so, he betook himself to England. Some little time previous, the young Arouet had assumed

the name of Voltaire, destined to become so famous. As to the origin of this name, considerable perplexity has existed; but there can scarce be a doubt of the correctness of the conjecture thrown out by Mr Carlyle, in the second volume of his *Frederick*, that it is simply an anagram of Arouet l. j. (*le jeune*).

Arriving in England in 1726, V. remained there upwards of two years. Of this episode of his life, we have only the most meagre account. It is certain, in a general way, that he had the *entrée* to the best English society; he knew Bolingbroke, Pope, and, we need not doubt, many others of the intellectually distinguished. Of his visit to the famous Mr Congreve, and the little skirmish of wit between them, we have express record. It was a whim of Congreve to affect dislike of his fame as an author, as to a certain extent a disparagement of his claims as a person of quality. On his signifying to V. that it was simply as this last he desired that his friends should regard him, he was answered to the effect, that had he been nothing more than the elegant gentleman he considered himself, M. de V. would scarce have thought it worth while to solicit the honour of his acquaintance. To V., his residence in England was fruitful of new knowledge and ideas; in the school of the English Deists, Bolingbroke, Collins, Tindal, Wollaston, &c., he found speculations much to his mind; the philosophies of Newton and Locke he studied diligently; and in his subsequent dramas there may be traced a distinct influence from Shakspeare, whom, however, he has expressly vilified, as a barbarous monster of a writer, intolerable to any reader with the least tincture of orthodox French *gout* in him. Not the less the distinction remains with V. of having been the first Frenchman to recognise in some decisive, if grudging and inadequate way, the essential superiority of our great national poet. The intellectual debt thus indicated was not the only one which V. owed to England. Whilst resident there, he published in a revised form his epic poem, the *Henriade*, a surreptitious edition of which had already appeared in France. The work was dedicated in English to Queen Caroline; the subscription for it was headed by her and other members of the royal family; the rank and fashion of the country could not but follow the illustrious example set them; and for result, V. could convey into his pocket a comfortable sum (stated so high as £8000), which became the basis of his future fortune. From the time of his return to Paris in 1728, he had always on hand some money speculation: investments in corn, bacon, or whatever a pretty penny could be turned by, with now and then a fat army-contract, which a friend might have interest to secure for him; and so shrewd in his finance was he, that, owing but little to his books, which, despite of their immense popularity, were never a source of great profit to him, his income at his death is ascertained to have netted some £7000 per annum, a revenue then to be styled princely. Of his literary labours, from this time forward unremitting, the sum of which remains in something like ninety volumes, no detailed account can here be attempted. His was truly a universal genius; he wrote literally everything—histories, dramas, poems, disquisitions, literary, philosophical, and scientific; novels, for the most part with some doctrinal purpose, of which his famous *Candide*, or the *Optimist*, may stand as the type; his literary correspondence was on an unexampled scale; and he was seldom without some fierce polemic on hand, in which his adversaries had to writhe for the amusement of the public, under the scourge of his envenomed wit.

In the gay society of Paris, he became acquainted

with a certain Madame du Châtelet, who was living apart from her husband, the Marquis, though still on polite terms with him. She was *assez spirituelle*; a most fascinating woman of the world, and in the matter of intellectual accomplishment, the bluest wonder of the period; most especially she was deep in mathematics, and had mastered the mysteries of Newton's *Principia*. As himself an admirer of Newton, V. could not but be charmed to meet him thus surprisingly put into petticoats; nor could a woman so intellectual as Madame fail, in her turn, to appreciate the tender attentions of such a genius as M. de Voltaire. Their intimacy became extreme; and finally, in 1733—the husband of the lady behaving like a philosopher and man of fashion of the time, and continuing now and then to visit them—they went off to prosecute it undisturbed at Cirey, an old chateau in Champagne, the property of M. du Châtelet. Here, for the most part, they diligently studied Newton together for the next fifteen years. The arrangement seems to have been on the whole a not unhappy one; but towards the close, it became complicated for M. de V. by the advent of another lover, in the person of a Monsieur de Saint-Lambert. It is not conjectured that this gentleman knew anything of Newton, or was at all such a genius as V.; but it is certain that, on some other ground unexplained, he found favour with Madame du Châtelet. The philosophy which the husband had been good enough to practise in favour of V., was now required of himself; and after a little unpleasantness he was able to reconcile himself to the inevitable. This curious triangular love-affair—or *square*, if we include the husband—was not, however, of very long duration. In 1748, Madame du Châtelet died in child-bed. V. was overcome with grief; and the touching reproach which, in the first agony of bereavement, he addressed to the culpable M. de Saint-Lambert, a fortunate chance has preserved for us: 'Eh! mon Dieu! Monsieur, de quoi vous aviez vous de lui faire un enfant.' This, which is now so shocking, illustrates strikingly the morals of a period in which it seemed entirely *comme il faut*.

To dissipate the sense of loneliness which overpowered him in the loss of his 'divine Emilie,' as he was wont, in his more lyrical moments, to call her, V. once more betook himself to Paris, whence, in 1750, he proceeded to Berlin, on the invitation of the young king of Prussia, Frederick, since known as 'the Great.' Between him and V., much correspondence had already passed; and they seem to have entertained for each other a sincere admiration and regard. When they came together, however, it was found, as so often in such cases before and since, that it is not in the matter of mountains only that 'distance lends enchantment to the view.' They quarrelled bitterly, and parted; V., at his exit from the country, being subjected to indignities which he found it hard to forgive. Into the details of the quarrel we need not enter. When we say that the king was a poet at once most profuse and most execrable; and that the main function of V.—himself a poet—was to criticize and correct his verses, it should almost seem that we indicate, without going further, a sufficient *origo mali*. V. detested the king's verses; the king could hardly have been even the very bad poet he was, without heartily detesting V.'s criticism and corrections. Is it marvellous that in no long time they got heartily to detest each other? A reconciliation was afterwards effected, and their literary correspondence was resumed under the old forms of friendliness; but meantime V. had avenged himself in the amusing but most scandalous chronicle, entitled *Vie Privée du Roi de Prusse*, which was found at his

death among his papers, and published, as there is pretty good reason to suppose the wicked wit meant it should be.

After some years of a somewhat unsettled kind, V., in 1758, established himself along with his niece, Madame Denis, at Ferney in Switzerland, where, with little exception, the last 20 years of his life were passed. During this period, some generous traits of character are recorded of him. Thus, he rescued from extreme want a grand-niece of Corneille the great dramatist, had her carefully educated under his own eye at Ferney, and made over to her the proceeds of an annotated edition of her ancestor's works, which he issued for her express benefit. His noble exertions in behalf of the Calas family, the victims of a shameful persecution, are also well known. In 1778, he was induced by his niece to revisit Paris. By the Parisians, the poet, now in his 84th year, was received with a perfect tumult of enthusiasm, the excitement connected with which is thought to have hastened his death, which took place on 30th May of that year.

With the doubtful exception of Rousseau (Jean Jacques), who in his character of *vates* and enthusiast, was perhaps even more deeply influential, V. is by far the most memorable of the band of celebrated writers whose crusade against established opinions was preparing the grand *culbute* of the French Revolution. As every one knows, it was mainly in the field of religious polemic that his destructive energies were exerted. It is common to stigmatise him as an Atheist, but this is simply to exhibit ignorance. Discarding revelation, he steadily upheld the truths of natural religion, and was, in fact, a Deist pretty much of the English type. As such, he was not a little despised by the more 'advanced' minds of the period, Diderot and the like, who considered belief in a God clear evidence of intellectual infirmity. His favourite weapon was ridicule, and there was never, perhaps, a greater master of it. In a particular form of polished mockery, V. remains almost without a rival. His prose is the perfection of French style; it is admirable in grace, clearness, vivacity, and alive like a sparkling wine with the particular quality of *esprit* peculiar to the people and the language. As a dramatist, V. takes rank as a worthy third with his two great predecessors Corneille and Racine. His most famous poems are the *Henriade*, before mentioned, the one epic of the language, and *La Pucelle*, which is, perhaps, more properly to be styled infamous, such is the profanity and indecency with which the writer has wilfully defiled the heroic story of the Maid of Orleans. In the historical works of V., with the utmost lucidity of method, there are traces of a more philosophical treatment than had previously been applied to such subjects. For its narrative charm, his little *historiette*, *Charles Douze*, familiar to every school-boy, is in its kind a perfect model. Strange to say, neither in French nor in English does any full or adequate biography of V. exist. Of his earlier life, a most racy and amusing sketch will be found in the second volume of Mr Carlyle's *Frederick the Great*; and his relations with Frederick are of course in that work treated of in full, with the writer's characteristic humour and insight. As a critical estimate at once of the man and of the writer, nothing better can anywhere be found than Mr Carlyle's earlier *Essay*.

Almost as we write, the first volume of a *Life of Voltaire* has been published by Chapman and Hall. The writer, Mr Francis Espinasse, presents in a lively and entertaining form the results of an accurate and exhaustive investigation; and the work when complete, as proposed, in three volumes,

will, without doubt, ably supply what is hitherto a desideratum in English literature.

VOLTE'RRRA, a town of Central Italy, in the province of Pisa, stands on a table-land at the height of nearly 2000 feet above sea-level, 30 miles south-east of Leghorn. It is surrounded by cyclopean walls, which are in a better state of preservation than any structures of the same kind in Italy. The gate called *l'Arco*, and the remains of baths and of an amphitheatre, are interesting vestiges of antiquity; the cathedral, municipal palace, and *Pretorio*, are monuments of the middle ages; and the *Mastio*, a prison, is a modern edifice. V. contains a college, numerous schools, and a library of 120,000 vols. Wine, oil, corn, and mulberry trees are grown in the lands belonging to the town, which also possesses considerable mineral wealth. Pop. 13,099.

V., the ancient *Volaterra*, was one of the most powerful and important of all the Etruscan cities, and came into the possession of Rome 474 B.C.; after the fall of the Empire, it suffered much from the invasion of barbarians.

VOLTIGEURS, picked companies of irregular riflemen in the French regiments. They are selected for courage, great activity, and small stature. It is their privilege to lead the attack.

VOLTI SU'BITO (Ital. turn quickly), in Music, an indication placed at the foot of a page, to signify that the page ought to be turned without delay.

VOLTRI, a town of Northern Italy, in the province of Genoa, and 9½ miles west of the city of that name, on the Gulf of Genoa. Its churches are richly adorned; it contains many fine villas, and manufactures paper extensively. Near it are the sulphureous springs and baths of Aqua Santa, very efficacious in cases of cutaneous disease. Pop. 11,802.

VOLUMETRIC ANALYSIS, in Chemistry, consists in submitting the substance to be estimated to certain characteristic reactions, the chemist employing for such reactions liquids of known strength, and from the quantity of liquid employed to induce the reaction, determining the weight of the substance to be estimated by means of the laws of equivalence. The idea of this method first suggested itself to Gay-Lussac in considering how most readily to determine the amount of silver in an alloy of that metal and copper; but the method itself did not come into general use till within the last twenty years. The liquid reagents of known strength are called *standard solutions*; and the amount employed may be estimated either by weight or by volume, but the latter being the easiest of application, is universally employed; and hence this method of analysis, based on the use of standard solutions, is called *volumetric analysis*. In order that a reaction may be applicable in volumetric analysis, it must satisfy the two following conditions: (1) It must not occupy much time; and (2) the termination of the reaction must be easily recognised and unmistakable to the eye. The necessity that these conditions should be fulfilled, very much limits the number of volumetric processes. In addition to the ordinary chemical apparatus, this kind of analysis requires graduated glass vessels of different kinds for the measurement of the standard solutions. Of these, the most essential are: (1) *Pipettes*, which are glass vessels of the form of figs. 1 and 2, intended for the delivery of the standard solution. Fig. 1 is provided with a single mark upon the neck, while fig. 2 is divided and graduated through its whole length, the division being always made into cubic centimètres (c. c.), according to French scale; (2) *Flasks* graduated for the contents in various sizes from one-tenth of a litre to five

litres, and used for the preparation of standard solutions; (3) *Burettes*, or graduated tubes for measuring the liquids used in an analysis. The burette was invented by Gay-Lussac; but since his time, various modifications have been proposed, the best of which, for general purposes, is that

Fig. 1.—A Pipette, containing 10 c. a.
 Fig. 2.—A Pipette, containing 50 c. a., divided through its whole length in c. a.; being thus graduated for measuring the delivery of fluids.
 Fig. 3.—a, the india-rubber; b, the slips made of brass wire, by which the india-rubber tube can be closed at will.

which is known as Mohr's Burette. It is shewn in fig. 3; and its lower part is attached to an india-rubber tube and spring-clamp or clip (*Quetsch-Hahn*). Its principal advantages over other forms of the instrument are, that its constant upright position enables the operator at once to read off the number of degrees of standard (or test) solution used for any analysis, while the quantity of fluid to be delivered can be most accurately regulated by the pressure of the thumb and finger on the clamp; moreover, as it is not held in the hand, no error is likely to arise in the measurement from the heat of the operator's hand. The greatest drawback to it is that it cannot be used for those test-solutions which decompose india-rubber.

The *standard solutions*, known also as *test* or *titrated solutions* (from the French word *titre*, which signifies the standard of a coin), may be divided into (1) such as are immediately prepared by weighing a substance of known composition, dissolving it, and diluting it to the required volume; and (2) such as are prepared by approximate mixture and subsequent exact analysis. The preparation of the first kind requires no description; for the preparation of the second kind, we must refer to the article 'Analysis, Volumetric,' in *Watts's Dictionary of Chemistry*, vol. i. p. 259, where the method is fully explained, and as an example, the preparation of a standard solution of sulphuric acid containing 1

grammes of hydrated sulphuric acid in 1 litre is given. It is obviously essential that the greatest care must be taken both with respect to the graduation of the measuring instruments and the strength and purity of the standard solutions, which must be protected from evaporation and other hurtful influences by being kept in bottles of 1 or 2 litres' capacity, provided with well-ground stoppers.

Volumetric methods are usually classified as follows, according to the principles on which they are based—(1.) *Analysis by saturation*, when the quantity of a base or an acid is measured by the quantity of acid or base which is required for exact saturation—a point to be determined by test-papers, tincture of litmus, &c. (2.) *Analysis by oxidation and reduction*, when the quantity of the substance to be determined is found by the quantity of chlorine, bromine, iodine, or oxygen to which it is equivalent (regarded as oxidant), or by the quantity of chlorine, bromine, iodine, or oxygen which it requires to pass from a lower to a higher stage of oxidation. The chief oxidising agents are permanganate of potash and bichromate of potash; while the reducing agents chiefly used are protoxide of iron and hyposulphite of soda. (3.) *Analysis by precipitation*, when the determination of a substance is effected by precipitating it in some insoluble and definite combination. Our limited space does not admit of our giving an example of more than one of these forms of analysis, and from its historic interest we shall select the last, in its application to the determination of silver. We shall borrow Mr Sutton's account of this process. 'Suppose,' he observes, 'that it is desirable to know the quantity of pure silver contained in a shilling. The coin is first dissolved in nitric acid, by which means a bluish solution containing silver, copper, and probably other metals, is obtained. It is a known fact that chlorine combines with silver in the presence of other metals to form chloride of silver, which is insoluble in nitric acid. The proportions in which the combination takes place are 35.5 of chlorine to every 108 of silver; consequently, if a standard solution of pure chloride of sodium is prepared by dissolving 58.5 grains of the salt—i. e., 1 eq. sodium (= 23) plus 1 eq. chlorine (= 35.5) or 1 eq. chloride of sodium—in so much distilled water as will exactly make up 1000 grains by measure, every single grain of this solution will combine with 0.0108 of a grain of pure silver to form chloride of silver, which precipitates to the bottom of the vessel in which the mixture is made. In the process of adding the salt solution to the silver, drop by drop, a point is at last reached when the precipitate ceases to form. Here the process must stop. On looking carefully at the graduated vessel from which the standard solution has been used, the operator sees at once the number of grains that have been necessary to produce the complete decomposition. For example, suppose the quantity used was 520 grains; all that is necessary to be done is to multiply 0.0108 grains by 520, which shews the amount of pure silver present to be 56.16 grains.' By volumetric as compared with ordinary analysis, a large amount of time, labour, and therefore of expense, is saved; at the loss, however, often of due accuracy, unless the greatest care be taken that the standard solutions are of due strength, and the instruments accurately graduated. An analysis can thus be completed in a quarter of an hour, that would formerly have occupied a day or more. Independently of its application to pure chemistry, it facilitates to a great extent the chemical analysis of urine (on which subject see the English translation of Neubauer and Vogel *On the Urine*, published by the New Syd. Soc.), of waters (on which see Parkes *On Hygiene*), of manures, soils, &c.; and its processes

have been freely introduced in the British Pharmacopœia. The standard book on this subject is that of Mohr, a German chemist; the English reader may consult the text-books of Scott of Dublin, and Sutton of Norwich, and various Memoirs in the *Chemical News*.

VOLUNTARY CONVEYANCE is, in Bankruptcy and other proceedings, a conveyance which is made without any legal consideration, either of money or of marriage; and in competition with creditors having deeds made for consideration, is often deemed fraudulent, and is generally postponed or set aside altogether.

VOLUNTARIYISM, the principles or system of polity distinctive of those who advocate the separation of church and state; the cessation of state endowments and state grants for religious purposes, and, in general, of all interference, patronage, or exercise of authority on the part of the civil power in the religious and ecclesiastical affairs of the subject. The terms Voluntaryism and Voluntary have been in use since the date of the keen discussions regarding civil establishments of religion—commonly called the 'Voluntary Controversy'—which sprung up in the second decade of this century between churchmen and dissenters, in Scotland; and they serve to suggest, not inappositely, the fundamental conception which underlies the creed of religious dissent, that all true worship, or acceptable service in religion, must be the free expression of individual minds, and that, therefore, religion ought to be left by civil society to mould itself spontaneously according to its own institutions and spiritual nature, without violence to individual freedom from any interposition of secular authority or compulsory influence. Voluntaryism seeks to define more accurately the limits of civil power by defining more adequately than preceding theories had done the latitude due to the movements of religion. Assigning the magistrate his proper sphere, it is equally careful to assign the church and the individual their appropriate spheres of responsibility and duty in reference to religion, within which they may work unchecked, in full harmony with all the claims of civil order. Voluntaryism may be regarded as the formula of advanced Protestantism, the corrected doctrine of church and state, which the failure of the experiment of national churches has forced on public thought. It is a protest in modern language against the encroachment of the temporal power, whether under the name of magistrate, nation, or political majority, on the rights and liberties of individual conscience. Voluntaryism has sometimes been erroneously considered the offspring of theological neutrality. On the contrary, its leading advocates base it on the expressed law of Christ respecting the constitution, administration, support, and extension of the church, as well as on the rights of conscience, the nature of civil government, and considerations of general equity and policy. In its most extensive sense, Voluntaryism embraces the whole question of the province of the magistrate in reference to religion and the church. Voluntaryes admit that magistrates as well as other men, being under law to God, ought so to execute the proper duties of their office that all shall be done in consistency with the paramount claims of morality and religion. At the same time, the nature and design of civil government excludes their authority from the domain of religion and conscience, and confines it to the secular concerns of individuals and of society. Magistrates, like other men, are under obligation to seek and to follow the highest available light and guidance in duty; but it is not

therefore allowed them to convert the rules of the Divine Word, which are addressed exclusively to the individual conscience, into laws for civil society. God alone being lord of the conscience, such laws only—though revealed in His Word—may be adopted and enforced in civil society as are requisite for its outward preservation, peace, and good order, and for the advancement of those secular interests which are the proper care of its rulers. While, therefore, magistrates, no less than other men—and for reasons common to all favoured with the Gospel—ought, as individuals, to embrace and profess the Christian religion, and to employ wisely and justly the influence arising from their circumstances and station, it is no part of their political or official duty, or of the homage required of them by Christ, to emit, adopt, prescribe, or enforce a confession of faith; neither is it within their province to aim at establishing or propagating Christianity by the civil arm, to provide for, endow, or subsidise its teachers either in churches or schools; but it is their duty impartially to protect all their subjects, of whatever creed, in the enjoyment of full religious liberty, so long as their manner of exercising this civil right does not infringe on the equal rights of others. On this ground, and with such qualification, it is their duty to abstain from all interference with the jurisdiction and economy of the church—not excepting the matter of its support—which being regulated, as Voluntaryes believe, by special ordinances of Jesus Christ, its Head, it is an invasion of His prerogatives, and a frustration of His law for its support and extension, to place, or suffer to be placed, on the footing of a civil establishment. The doctrine regarding the support of religion has always been an important article in the Voluntary creed, and, in a restricted sense, Voluntaryism has been popularly defined by this doctrine. Negatively, the duty of providing for the support of Christian institutions does not lie with the magistrate or nation. The giving of property for the support of the gospel has been elevated by Voluntaryism from the position of an almost eleemosynary and political custom, to the rank of a systematic obligation and a financial law of the church. It is recognised as an act of religion, the duty and privilege of all Christians; and as each man is a steward of his silver or gold, responsible to none but its great Owner for his disposal of it in religious matters, the magistrate can possess no right to demand from him any portion for religious uses, or to apply to these uses the proceeds of taxation imposed for general ends. Civil society being promiscuous and variable in its constitutions, a fixed arrangement for the endowment of religious bodies out of the public funds, is a fixed usurpation—as a system of occasional grants is an occasional usurpation—upon the liberty and property of all who dissent. The existence of an absolute unanimity among the subjects—even were it possible, as it would be otherwise, to ascertain and secure it from time to time—however it might remove for the moment from any minds the feeling of political grievance incident to such arrangements, could neither justify them as a policy, nor alter their character as an interference with religion in its economics. In its broad aspect, as an overstepping of the sphere of magistracy, all who restrict the magistrate, on whatever specific grounds, to secular affairs, must deem such interference objectionable; and Christian Voluntaryes would reasonably ask, why legal machinery should be employed to gather the offerings which, in the state of public sentiment supposed, must be flowing unforced through their natural channels? and in particular, whether, if Christ has not appointed the magistrate to 'tithe and toll' for his church, society can presume to

assign him a work beyond his province? There is a manifest division of duties dictated alike by reason and revelation; and Voluntariyism claims the results of experience as proof of the entire want of adaptation in the compulsory or magisterial power to deal with the support of a living religion. To burden the rent-roll, increase the assessments, distrain the goods and chattels of citizens, or even to preserve the forms of legal exaction for such a purpose, are measures which it is hard to believe either politic, scriptural, or just. The pecuniary supplies required for religious objects are to be secured, according to Voluntariyism, solely through the operation of moral influences and sacred motives. Truth, as well as error, must be left to provide for itself. The responsibility and privilege of providing for the support of Christianity having been attached by Christ to His church, it is further His law that its institutions shall be maintained and extended by the voluntary liberality of its friends. A primary obligation rests on those enjoying the services of a pastor to provide according to their ability for his maintenance, on the apostolic principle—'Let him that is taught in the word communicate to him that teacheth in all good things;' while, on the equally apostolic principles, that the labourer is worthy of his hire, and that the strong should aid the weak, a mutual and collective responsibility remains with the general membership, to supply each other's ecclesiastical necessities, and to unite in measures that may provide an adequate remuneration to the pastors or other ministers of the church. Civil establishments of religion, together with all forms of state endowments and grants for religious purposes, are thus condemned by Voluntaries as human expedients, adverse to Christian development and the working of the law of self-support, which alone draws forth the resources, and educates the consciences and habits of the people. Inadmissible, as introducing the compulsory element into the free and delicate movements of Christian society, and intruding magistracy into a sphere which the history of all struggles for the higher liberty teaches must be preserved to the individual and the church, these institutions tend to foster political dependence and class-feeling among the recipient bodies, and prevent those relations of honourable trust and responsibility which best unite pastors and people. These views express what may be called ecclesiastical Voluntariyism. On the question of education, various shades of opinion exist among Voluntaries. All are agreed that the religious education of the young belongs to the parent and the church, and is not to be provided or superintended by the state. How to secure this principle in connection with a system of national schools or government grants for education, continues to be the problem of Voluntaries. Some seek the solution in a plan of local boards representing the parentage and community, who shall manage the schools, and decide the character of the teaching; and of these, some advocate separation of the hours for religious and secular lessons. Others, who think that while by these methods state superintendence may be avoided, state aid is yet directly or indirectly received for religious instruction, would accept a system which provided simply for schooling in secular or common branches. Those known as Voluntary educationists reject the idea of any national system, some on account of the religious difficulty, and others on grounds connected with the philosophy of education and the theory of government. Voluntary educationists would leave the education of the poor to be secured by the operation of those influences which originate and sustain other necessary and benevolent measures. The education of the children of classes not

necessitous they expect to flow from private enterprise and free association. Voluntaries consistently object to grants to denominational schools dependent on the condition of teaching religion, to grants to ragged schools and all semi-religious institutions, as well as to the appointment and payment by the state of chaplains for prisons, the army, &c. In reference to the Sabbath, holding the sacred character of the day, some Voluntaries appear to admit that the magistrate is both entitled and bound not only to make it a *dies non* in his own department, but also to prohibit labour and amusements throughout the nation. Others, equally holding the morality of the day, with more regard to strict theory, deny him the power of inflicting pains and penalties, however mild, in a matter radically religious, at the same time that they assert the obligation of the state to secure all its members due protection and facility in the practice of their worship, and to make such laws for this end as may be fit, in view of prevailing religious observances. Regarding national fasts and thanksgivings, most Voluntaries hold that the style of authority in which royal proclamations appointing these have usually been expressed is objectionable, as assuming a right to prescribe the topics and language of devotion, and to regulate its seasons, and insist that the language of invitation should be substituted for that of command. Some, while ready to comply with an invitation of the sovereign to join in an offering of prayer on occasions they judge suitable, do not allow that it forms any part of magisterial duty to issue such appeals, or that the royal act imparts a national character to the service. Ordinary political acts become national when done by the proper national organs; but no religious acts can acquire a national character except they are participated by the body of the people. When this is the case, the exercise is national, though not evoked by the call of the chief of the state, and it is not made more national by that call. The advantage of simultaneousness and unity is attainable on the widest scale by the natural concert of churches apart from royal initiative, which, if it may be followed when right, need not be waited for as indispensable to true national worship. On the question of marriage, Voluntariyism, recognising its character as a civil transaction, demands that all religious parties stand on the same level in regard to it. Withholding legal sanction from all immoral connections, and punishing breaches of the lawful contract, magistrates are not warranted to visit with penalties any mere departure from the standard prescribed to Christian conscience, or embodied in ecclesiastical law. Political Voluntariyism, as it is sometimes called, is simply Voluntariyism expressed in the language of the politician—the doctrine of the entire religious equality of all citizens in the eye of law, stated and defended without reference to specific religious opinions, and in the way of appeal to principles generally received.

VOLUNTEERS—the great defensive citizen-force of Great Britain, in some degree corresponding to the National Guard of continental states. It is essentially self-supporting, and wholly unpaid; although government arms the men, and contributes a certain sum towards the corporate expenditure. The oldest volunteer corps is the 'Honourable Artillery Company' of the city of London, which dates from the reign of Henry VII.: although still called artillery, it comprises artillery, cavalry, and infantry, and is probably the oldest armed body in Europe. When the country was in dread of invasion by Bonaparte, almost the whole available male population flew to arms as volunteers, and in 1803 they mustered 463,134 effectives. About this time,

VOLUNTEERS.

George III. reviewed 150,000 volunteers. The force gradually diminished, when the immediate danger ceased; and before the war closed, they were replaced by a new force, called the 'local militia,' which was supposed to be more thoroughly amenable to government control. As early as 1857, two small volunteer corps, the 1st Devon and the Victoria Rifles, had sprung into existence; but in 1859, the whole nation seemed to awake to a sense of insecurity, with a comparatively small army, half of which was abroad, amid the enormous armaments of neighbouring states. In a few months, 150,000 men had organised themselves into companies; and in the following year, government, which had at first shewn no favour to the movement, gave it a helping hand by combining the companies into battalions, by appointing paid adjutants and drill instructors, and by the establishment of a staff of inspectors under the control of an Inspector-general of Volunteers. At present (1867), the volunteers number about 168,000 effective men, in a high state of training, and capable of performing well all the simpler military manoeuvres. They are divided into a small number of Light Horse, Mounted Rifles, and Engineers, a large force of Artillery, and a grand army of Riflemen. Where 60 men can be got together, a company of volunteers may be formed, which is entitled to a captain, lieutenant, and ensign for its officers. If a place can produce a corps of two companies, the senior officer becomes 'Captain Commandant.' Four companies make a major's command. Six are sufficient to constitute a battalion, for which government provides an adjutant, usually an old military officer, who receives 10s. a day besides his forage. When there are a number of detached companies in the different villages of a district, they are grouped into an administrative battalion (or brigade for detached batteries of artillery) with an adjutant, and with field-officers selected from the neighbouring gentry. England and Scotland are further divided into inspection districts, each presided over by an assistant-inspector of volunteers, who ranks as a lieutenant-colonel, and endeavours to keep the corps in his district up to the standard of efficiency. Over all these districts is the inspector-general of volunteers, who is at the head of a department of the War Office. Every company may have an honorary assistant-surgeon; but a corps of two companies is entitled to an assistant-surgeon; of four companies, to a surgeon, who may have one assistant when there are six companies, and two for eight or more companies. If a corps exceed a strength of twelve companies, it is customary to divide it into two battalions. The volunteer corps were originally raised under an act of 1804; but the circumstances of modern times having rendered various supplementary enactments necessary, the whole were embodied in a new act, the 26 and 27 Vict. cap. 65 (1863), under which the volunteer force of Great Britain is now constituted.

Under this act, adjutants are appointed by the crown; the other officers by the lords-lieutenant of counties (though practically they are elected by the members of corps, or nominated by the commanding-officers); the non-commissioned officers are appointed by the officers commanding. Adjutants and sergeant-instructors are at all times subject to the Mutiny Act—the other officers (and men) only when their corps is embodied; but the Queen can at any time deprive them of their commissions. Offences within corps, in time of peace, are punishable by fines or otherwise, as laid down in the rules of the several corps, which must have the approval of the Secretary of State for War. Every volunteer

on joining must take the oath of allegiance, and must be of the age of 17.

The force may not be used in times of civil disturbance, but may be embodied for active service anywhere in Great Britain, whenever the country is invaded, or invasion is apprehended by the crown. The occasion must first be communicated to parliament, or, if parliament be not sitting, to the country, by an order in council, and then the crown may direct the lords-lieutenant of counties to call out any or all of the volunteer corps in their respective counties for active service. Corps so called out come under the Mutiny Act, and are bound to march whithersoever the lord-lieutenant may command. While embodied, officers and men are entitled to the same pay as in the regular army. In point of precedence, volunteers rank with, but after, the same ranks in the army and militia. The yeomanry are reckoned as part of the volunteers. Among themselves, the volunteers rank in the following order: 1st, Light Horse; 2d, Artillery; 3d, Engineers; 4th, Engineers and Railway Transport Corps; 5th, Mounted Rifles; 6th, Rifles.

Members of a corps are honorary and enrolled. The first are merely subscribers of a certain amount; they are entitled to wear the uniform, but not to interfere in any manner in the corps. The enrolled members are the actual working-men; they are classed as 'efficient' and 'non-efficient,'—the efficient being those who are certified by the commanding-officer and the adjutant to have a competent knowledge of the duties of the service, and to have attended the following number of drills:

| ARM. | For Recruits during a Period not exceeding Eighteen Months preceding the Date of the Annual Return. | For others during each Twelve Months. |
|---|---|--|
| Light Horse, | 16 squad or troop drills, . . . | 6 squad or troop drills, 3 of which have been drills of the whole corps. |
| Artillery Volunteers, . . . | 30 drills, of which 24 are gun-drills, . . . | 12 gun-drills. |
| Engineers, . . . | 30 drills, . . . | 9 drills. |
| Mounted Rifles, . . . | 16 " . . . | 6 drills, of which 3 of the whole corps, . . . |
| Rifle Corps, with establishment of a battalion, . . . | 30 " . . . | 9 drills, of which 6 battalion, and 3 company drills. |
| Rifle Corps, not having establishment of a battalion, . . . | 30 " . . . | 9 drills, of which 3 battalion, and 6 company drills. |

The assistance afforded by the public to volunteer corps consists in the supply of adjutants and of sergeant-instructors in the proportion of 1 to a corps of 3 companies or less, 2 from 4 to 7 companies, 3 up to 12 companies, &c. The money aid is a *capitation grant* of 30s. annually for each artillery volunteer who is efficient, and in other corps 20s. annually for each efficient volunteer, in addition to which there is a rate of 10s. for each man who fulfils certain conditions prescribed in the regulations. In scattered administrative battalions, a charge of 4s. for each efficient is allowed to cover the cost of attending battalion drills. These allowances are, however, none of them personal, but are granted to corps, to be expended by the adjutant, who is accountable to the War Office, within certain limits, according to the discretion of the commanding-officer. Government likewise provides all the arms, and a certain quantity of practice-ammunition. Corps may choose their own uniform, subject to the approval of the lord-lieutenant; but no gold lace or buttons may be introduced. Volunteer corps do not bear colours. The system has not yet been extended to Ireland.

VOLU'TE, in Architecture, the spiral ornaments of the Ionic and Corinthian capitals, probably derived from Assyrian architecture, in which it is also used.

Volute.

ture notched in front, the *columella* obliquely plaited; no operculum. The animal has a very large foot, and a recurved siphon. The species are numerous, and abound chiefly in tropical seas. Many of them have very beautiful shells, much prized by shell-collectors. Several small species are found on the shores of Britain, of which *Voluta tornatilis* is the only one that is not rare. This genus makes its appearance in the Cretaceous strata, and increases in numbers in Tertiary deposits, no less than 50 species being known in the Pleistocene beds.

Shell of *Voluta tornatilis*.

VO'LVOX, a genus of minute organisms, the type of a family called *Volvocineæ*, now regarded as vegetable, and ranked among *Protophytes*, but which were at first supposed to be animals, and were reckoned by Ehrenberg among *Infusoria*. They are globular, or nearly so, are found in stagnant water, and move slowly through the water, revolving round an axis, by the agency of numerous little filaments which project from green points on their surface. It was on account of their motions that they were formerly thought to be animalcules, and, partly on the same account, it has been suspected that they are not really protophytes, but *zoospores* of some kind of alga. This opinion, however, is rendered improbable by their apparently possessing the power of reproduction; green granules being formed within the parent globe, at first adhering to its wall, and afterwards becoming detached; the parent globe finally bursting, to allow them to escape. These frequently exhibit, even whilst

Volvox globator.

within the parent globe, a rotatory motion similar to its own. The presence of starch in the interior of the *Volvocineæ* has been detected by means of iodine, and is regarded as a conclusive proof of their vegetable nature. The most common and best-known species is *Volvox globator*, which is just visible to the naked eye. It is a transparent sphere, having its surface studded with innumerable green spots, united by a beautiful net-work. From six to twenty young are often to be seen in its interior.

VO'LVULUS (Lat. *volvere*, to twist) is the term used in Medicine to signify a twisting of the intestine, producing obstruction to the passage of its contents. There are three distinct varieties of

rotatory movement capable of giving rise to volvulus—(1.) A portion of intestine may have become twisted on its own axis, and, in that case, even semi-rotation brings the intestinal walls into contact, so as to close the passage. This is a rare condition, and only occurs in the ascending colon. (2.) The Mesentery (q. v.), or a part of it, may be twisted into a cone, dragging the intestine with it; the mesentery being the axis, and the intestine being rolled up upon it. This form occurs in the small intestine. (3.) A single portion or a coil of intestine may afford the axis round which another portion, with its mesentery, is thrown, so as to compress it, and close the passage. A coil of small intestine, the sigmoid flexure or the cæcum (see DIGESTION, ORGANS OF), may form the axis. All these varieties occur chiefly in advanced life, and their seat is commonly towards the posterior unyielding wall of the abdominal cavity, the smoothness and yielding nature of the parts anteriorly rendering such an event almost impossible. The *symptoms* of twisting of the intestines, especially of the sigmoid flexure, which is the most common seat of the affection, are usually very well marked from the beginning. Great pain is suddenly experienced in a small circumscribed spot of the abdomen, obstinate constipation usually setting in from that date. If the sigmoid flexure, which lies just above the rectum, is the seat of the twisting, the abdomen soon becomes distended, especially on the left side, the distention being much more marked than when the twist is in the small intestine, as might physiologically have been expected. Vomiting, often constant and copious, is usually present. These cases are so desperate in their nature, that it is needless to enlarge upon their treatment. Attempts to remove the displacement by injecting water or air into the intestine by means of a long tube, have often been made, but with very slight success. Mr Pollock, in his article on 'Disease of the Alimentary Canal,' in Holmes's *System of Surgery*, remarks, that 'relief in twist of the sigmoid flexure is just possible without opening the abdomen, provided the long tube be introduced into the distended gut, its contents drawn off, and the twist be reduced by the altered position of the bowel. But no operation for the ultimate relief of the patient will be successful unless the intestine be unloaded first, and the twist then reduced.'—Vol. ii. p. 153. The operations that have been proposed for the relief of this and other intestinal obstructions are so often fatal, and, even when successful, leave the patient in so wretched a state, with an artificial outlet for the discharge of the contents of the bowels, that it is doubtful whether they should be recommended. It is simply a choice between almost certain death in a few days, and a possible chance of a prolonged (but usually a miserable) existence. There are, however, a few rules that should be universally known and attended to—*via*, wherever symptoms such as we have described occur, aperients should only be given by the rectum, while opium should be freely given by the mouth. Leeches and hot fomentations should be applied to the seat of pain; and all solid food should be prohibited, the nourishment being given solely in the fluid form.

VO'MER, a bone which, in the human skeleton, forms part of the middle partition of the nose, and the lower edge of which fits into grooves between the apposed surfaces of the palatine processes of the upper jaw and palate-bones. It exhibits many modifications in the different classes of *Vertebrata*. Its position is indicated in the figure of *Archetype Vertebrate Skeleton*, in the article **SKELTON**. It is specially noticed here because of the frequent occurrence of the term vomer in articles on fishes—a very important character being often found in the

presence or absence of teeth on the vomer, that is, along the middle line of the roof of the mouth.

VOMITING consists in the stomach emptying itself through the gullet and mouth. It is preceded by a feeling of nausea, a flow of saliva in the mouth, and the breaking out of perspiration; the countenance grows pale, a feeling of weakness spreads over the whole body, and the pulse becomes slow. At last the muscles of the abdomen and the diaphragm strongly contract, and the whole contents of the stomach are ejected with greater or less violence. The first matters to be ejected are the food and drink present, then mucus from the stomach and œsophagus, and lastly, bile from the duodenum. In cases of disease, abnormal substances are sometimes vomited, such as blood, fragments of the intestines, and even excrementitious matters. When the vomiting is over, it is followed by languor and drowsiness, or, if the excitement was inconsiderable, the usual state immediately returns.

The causes of vomiting are various. In the first stages of infancy, it is almost normal, and occasions no disturbance of the system. In many animals, too, it is a normal function of life, as when birds of prey reject the hair and feathers of their victims. The infant gets rid of the superabundant milk it swallows by throwing it up with no trouble. Some persons can excite themselves to vomit by swallowing air.

The immediate causes of vomiting may be reduced, according to Dr Carpenter, to the three following categories: (1.) The contact of irritating substances with the mucous membrane of the stomach itself; these, however, cannot act by *direct* stimulation upon more than its own muscular coat; and their operations upon the associated muscles must take place by *reflexion* through the nervous circle furnished by the pneumogastric and the motor nerves of expiration. (2.) Irritations applied to other parts of the body, likewise operating by *simply-reflex* transmission; as in the vomiting which is consequent upon the strangulation of a hernia, or the passage of a renal calculus; or in that which is excited by the injection of tartar emetic or emetin into the circulating current, when these substances probably produce their characteristic effect by their operation on the nervous centres. (3.) Impressions received through the *sensorial* centres, which may be either sensational or emotional, but which do not operate unless they are *felt*. In this mode seems to be excited the vomiting that is induced by tickling the fauces, which first gives rise to the sensation of nausea; as well as the vomiting consequent upon disgusting sights, odours, or tastes, and upon those peculiar internal sensations which are preliminary to sea-sickness. The *recollection* of these sensations, conjoined with the emotional state which they originally excited, may itself become an efficient cause of the action, at least in individuals of peculiarly irritable stomachs, or of highly sensitive nervous systems.—*Principles of Human Physiology*, 6th ed., p. 77.

According to the oldest doctrine respecting vomiting, it was held to arise solely from convulsive movements of the stomach, which was thought to take on a motion contrary to the usual peristaltic motion. Bayle advanced the opinion, that the stomach is quite passive in the operation, and that its contents are emptied entirely by its being compressed through the contractions of the abdominal muscles and the diaphragm. An apparently conclusive experiment of Magendie's, in which the stomach was removed, and a bladder substituted for it, had more recently (in 1813) satisfied most physiologists as to the passiveness of the stomach in vomiting, until Béclard and Budge shewed the

insufficiency of his experiment. It is found, in fact, that in vomiting there are two sets of actions, viz., (1) contractions of the abdominal walls, while the diaphragm remains fixed, and forms a support to the stomach, and (2) the stomach itself performs jerking movements, the pylorus, or inferior orifice, at the same time closing, while the cardiac sphincter relaxes, without which last-named action vomiting is impossible; and that either of the two kinds of movement—the abdominal or the stomachal—may eject the contents of the stomach into the gullet.

In the treatment of vomiting, we must consider it as a symptom rather than as a malady. Where the stomach is irritated, relief is afforded, according to circumstances, by drinking cold water, aerated or soda water, or, if necessary, by opium or nuxvomica. Cold applications outwardly also do good. In other cases, infusions containing ethereal oils—camomile, coffee, &c.—astringents, or correctives for acidity—magnesia, soda, &c.—are the fitting remedies. When the irritation is in the brain, the best remedy is a horizontal position, with composure and darkness. If a person in sound health is suddenly seized with vomiting, poisoning may be suspected.

VONDEL, JOOST VAN DEN (pr. *Jóet*), the greatest Dutch poet, was born at Cologne, November 17, 1637, his parents, who were Anabaptists, having fled from Antwerp to avoid persecution. His maternal grandfather, Peter Kranen, ranked among the poets of Brabant. When freedom began to raise the head in Holland, the elder Vondel removed with his family to Utrecht, and afterwards to Amsterdam, where he prospered in trade. The poet's education in boyhood was limited to reading and writing, but his perseverance and love of study enabled him in after-life to become intimately acquainted both with ancient and modern literature.

At the early age of 13, his poetical efforts were praised by Hooff. In his 23d year, he married Maria de Wolf, to whose clever management V. chiefly left his business as a hosier, while he devoted himself to study and poetry. The tragedies of V. are very numerous, and the grandest specimens of Dutch literature. His satirical writings and epigrams are full of fire, energy, and spirit. One of his most remarkable pieces is *Lucifer*, published in 1654, strikingly resembling Milton's *Paradise Lost*, which appeared thirteen years later. V. took an earnest and active part in favour of the Remonstrants, Grotius and Oldenbarneveld, drawing down on himself the anger both of the clergy and court, whom he attacked with the keenest satire.

Gysbrecht van Aenstel, *Adam in Banishment*, *Palamedes*, *The Batavian Brothers*, *Solomon*, *Samson*, *Adonijah*, *Noah*, or *The Destruction of the Old World*, *Mary Stuart*, &c., are splendid efforts of genius. *The Harpoon*, *The Horse-comb*, and the *Decretum Horribile* are stinging satires on the ruling powers both in church and state. V.'s translations from the Greek and Roman writers are numerous, the *Metamorphoses* of Ovid having been rendered into Dutch verse when he was 84 years old. V. left no subject untouched, no measure untried. His works (9 vols. quarto) contain many sea-songs, and more than 100 odes. Many of the later poems were written with a strong Roman Catholic spirit, he having joined that church about 1640. Through the imprudences of his son, to whom he had given his business, V. fell into straitened circumstances, and in 1658 accepted a situation in the City Pawn-broking Office. In 1663, the magistrates allowed him to retire with his salary of 650 guilders yearly, which kept him above want. He was of moderate stature, well made, and had an eagle eye. After his powers of body and memory had begun to fail, he could still read without glasses. He died calmly

on the 5th of February 1679, at the age of 91, and was carried to his resting-place in the new church, Amsterdam, by fourteen poets, himself Princeps Postarum.

VOPADEVĀ is a celebrated grammarian of India. He wrote a grammar entitled *Mughhabodha*, which is held in high repute, especially in Bengal, and was commented upon by *Durgadāsa*. (Both text and commentary have been edited at Calcutta in 1861; previous editions contain merely the text of V.'s grammar.) It differs from the great work of Pānini (q. v.) in its arrangement as well as in its terminology; and without the commentary of *Durgadāsa*, would not yield by far the information that may be derived from Pānini's grammar. It is valuable, however, on account of many later Sanscrit formations, that could not be contained in the older work. V. composed also a catalogue of Sanscrit *dhātus*, or so-called radicals, in verse, called *Kavikalpadruma* (published at Calcutta, 1848), and a commentary on it, the *Kāvyaśāstramādhenu*. Another grammatical work, the *Rāmavyākaran'a* is likewise attributed to his authorship. According to a general tradition prevalent in India, V. would also be the author of one of the most renowned Purān's (q. v.), the *Bhāgavata-Purān'a*; and in a little treatise, the *Durjanamukha-chapet'ikā*, or 'a slap on the face of the wicked,' which is averse to this tradition, and maintains that Vyāsa (q. v.) was the author of this Purān'a, three other works of a religious character are assigned to V.—viz., the *Paramahansa-priya*, *Muktāphala*, and *Harillā*. A little medical work, the *Satas'lokachandrikā*, though written by a Vopadeva (see Professor Aufrecht's *Catalogue of the Sanscrit MSS. of the Bodleian Library*), does not seem to belong to the author of the works just mentioned. The date of V., given by some as the 12th, by others as the 13th c. after Christ, is, according to Burnouf's investigation, the second half of the 13th century.—See E. Burnouf's Preface to his edition, and French translation, of the first nine books of *Le Bhāgavata Purān'a*, vol. i. (Paris, 1840).

VORANT, in Heraldry, a term applied to an animal represented as swallowing another; as, sable, a dolphin naiant, vorant a fish proper.

VORONEJE, or VORONETZ (pronounced *Voronesh*), a government in the south of Great Russia, bounded on the S. by Little Russia and South Russia. Area, 25,712 sq. m.; pop. (1866) 1,975,000, consisting of Russians and German colonists. It is watered by the Don, its two navigable tributaries, the Voroneje and Khoper, and other streams. The soil, mostly a black mould, is generally fertile, and great crops of grain—wheat, rye, barley, oats, and millet (which supply the inhabitants and local distilleries, and are exported)—are produced. Cattle and horses of a good breed are reared—the best studs belong to the crown. The principal manufactured articles are brandy, beer, cloth, beet-root, sugar, skins, wax-candles, soap, tobacco, and potass; and corn, tallow, hemp-seed, cattle, and horses are exported to Moscow, St Petersburg, &c.

VORONEJE, a town of Great Russia, capital of the government of the same name, stands on the right bank of the Voroneje, 150 miles south-west of Tambov. It was founded in 1586 as a bulwark against Tartar invasion. Peter the Great, who had previously visited the town, built a fortress and a dockyard here in 1694. Besides two cathedrals, the town has many important civil, ecclesiastical, and educational institutions. The commerce of V. is extensive—the chief articles of trade being corn, hemp-seed, and tallow. Pop. 40,967.

VORTEX (Lat. a whirlpool). Till lately, it was

a reproach to Hydrodynamics that the theory of vortices or eddies in fluids had not been properly brought under the domain of mathematical analysis. Even now, the problem has only been partially solved by the labours chiefly of Stokes (q. v.) and Helmholtz (q. v.), as their beautiful investigations apply only to perfect fluids, that is, fluids which oppose no frictional resistance to change of shape. In ordinary motions of perfect fluids, such as currents and waves, the instantaneous change of shape of a small spherical portion makes it an ellipsoid by simple extensions and compressions without rotation. The essential characteristic of vortex-motion is, that it involves rotation of some parts of the fluid. Helmholtz has shewn that this rotational or vortex-motion remains with the parts of the fluid which first have it, and cannot be transferred. We can conceive no process by which vortex-motion could be given to, or taken from, a perfect fluid; for to our reason fluid friction (which does not exist in a perfect fluid) would seem to be indispensable. On such abstruse subjects we cannot of course enter here; but one result of Helmholtz's investigations is so curious that we must mention it. We are all familiar with those singular smoke-rings which are produced when a mortar is fired; or when, on a smaller scale, a bubble of phosphuretted hydrogen takes fire in air, or a smoker skilfully emits a puff of tobacco-smoke. A very simple mode of producing them, on even a large scale, is to bore a hole in one side of a box, remove the opposite side, and substitute a cloth or sheet of india-rubber for it. A slight blow on this membrane ejects a vortex-ring from the hole. To make this vortex visible, we may burn phosphorus or moistened gunpowder in the box; or still better, sprinkle its interior with ammonia, and introduce a vessel containing common salt and sulphuric acid. The sal-ammoniac cloud which fills the box is admirably adapted to display the rings. The general character of these rings, or vortex-tubes, is shewn in the diagram (fig. 1); which indicates that, besides a progressive motion as a whole, the ring revolves about its own central or medial line. Suppose two

Fig. 1.

such rings to follow each other, with their planes parallel, and their centres moving in the same line, Helmholtz shews that (at least in a perfect fluid) the foremost will relax its speed, and spread out into a larger ring, while its follower will contract, and quicken its pace, till it passes through the other, which in turn becomes the pursuer, and so on. This very curious result may be realised in a tea-cup, by drawing the half-immersed bowl of a tea-spoon along the surface of the tea for a short way, and withdrawing it. Two little whirlpools, or vortices, are then seen moving side by side. They are sections of the half vortex-ring which has been formed in the liquid by the spoon. A second half-ring may be at once sent after them by another stroke of the spoon, and the phenomenon above described will be obtained. When, on the contrary, two such vortex-rings meet, their centres moving in one line, they both spread out, and relax their speed indefinitely. This is obtained in a liquid by letting the half vortex-ring impinge directly on the side of the vessel, when it spreads out, and relaxes its speed; just as if there were no boundary of the fluid, but a second

vortex-ring occupying the place of the image of the first which would be formed by a plane mirror substituted for the side of the vessel. When one vortex-ring impinges obliquely on another, it rebounds from it, and both are thrown into vibration, their form of equilibrium being circular. They act in fact in this respect like solid india-rubber rings. By forming them from an elliptic aperture, they are produced in a state of vibration. A square aperture gives them in a different state of vibration.

The impossibility of producing or destroying vortex-rings in a perfect fluid—save by creative power—has lately led W. Thomson (q. v.) to regard

Fig. 2.

the ultimate parts of matter as vortices of various kinds in a perfect fluid. Two such indestructible vortex-atoms are here sketched (fig. 2).

The word vortex has also come into use in connection with Descartes's once celebrated theory of the universe, given in his *Principia Philosophicæ*. In this the rotation of the planets about the sun, the satellites about the planets, &c. were explained (!) by the hypothesis of vortices for ever whirling about the central body. Descartes was a good mathematician, but in *Natural Philosophy* he preferred metaphysics to experiment, and of course erred enormously. But he is not to be laughed at: mistakes more ridiculous than his are gravely propounded at the present day.

VORTICELLIDÆ, a family of *Infusoria*, remarkable for beauty, and containing a great number of species, to which, from their form, the name of *Bell* or *Bell-flower Animalcules* is often given. The genus *Vorticella* consists of minute cup-shaped or

Group of Bell-flower Animalcules (*Vorticella nebulifera*).

bell-shaped creatures, each placed at the top of a long flexible stalk, the other end of which is attached to some object, as the stem or leaf of an

aquatic plant. Around the edge of the bell or cup is a fringe of rather long cilia, the motion of which brings food to the mouth. The stem is flexible, and is sometimes stretched out to its full length, sometimes contracted in a spiral form. The contraction takes place instantaneously upon any alarm, the cilia at the same time vanishing; and it is very interesting to watch a group of *Vorticella*, which may often be easily done with a Coddington lens, when they adhere to the inside of the glass of an aquarium. The stem is often beautifully branched, the *Vorticella* becoming a compound animal, like many zoophytes, and the whole contracts or is extended at once. The stem, slender as it is, is a tube, through the whole length of which runs a minute muscular thread. A cup or bell of a *Vorticella* sometimes develops a new fringe of cilia at its point of junction with the stem, becomes detached from the stem, and begins to move freely through the water, till it finds a new place on which to fix itself, reproduction thus taking place by gemmation. Reproduction also takes place by encapsulation. See **INFUSORIA**. To the family V. belongs the genus *Stentor*, having a trumpet-shaped body, and therefore receiving the popular name of Trumpet Animalcules. They swim freely through the water, at the same time rotating on an axis, and attach themselves to objects by a sucker at the lower or narrow end. They have a fringe of cilia round the mouth, and the body of some species is covered with cilia. They are very voracious. They may often be found adhering to a twig or the stem of an aquatic plant, collapsed into minute masses of green jelly.

VOSGES, a dep. in the north-east of France, formed out of the south part of the old province of Lorraine, is bounded on the N. by the departments of Meuse and Meurthe, and on the E. by those of Bas-Rhin and Haut-Rhin. Area, 2346 sq. m.; pop. 415,485. The surface is mountainous, the territory being traversed not only by the Vosges Mountains, which run along its east border, but also by the Faucilles Mountains, which cross the dep. from east to west. The chief rivers are the Moselle, and its tributaries the Meurthe, Madon, and Mortagne, all of which flow in a north or north-west course through this department. The mountains in the east are covered with vast forests of beech and fir, and at the base of the mountains are tracts of pasture or rolling infertile plains. The west part of the dep., called the *Plaine*, is very fertile in cereals, vegetables, and fruits. Among the hills, the climate is cold; on the *Plaine*, it is humid. About 4,400,000 gallons of wine are produced annually. Mineral riches abound, there being iron, lead, copper, cobalt, and antimony mines. Of the kind of cheese called *Géromé*, 23,571 cwts. are made annually. The dep. is divided into the four arrondissements, Mirecourt, Neufchâteau, Remiremont, Saint-Dia. The capital is Epinal.

VOSGES MOUNTAINS (Lat. *Vogesus Mons*, Ger. *Wasgau*), a range of mountains in the north-east of France and the west of Germany, run from south to north, on the left bank of the Rhine, from the borders of the departments Haute-Saône, Haut-Rhin, and Doubs, north to Mainz. The range runs parallel with the Schwarzwald or Black Forest in Baden and Württemberg, on the right bank of the Rhine, and it separates what were the old provinces of Lorraine and Alsace. The summits are rounded and regular in outline, and are called *ballons*. The chief of them are the *Ballon de Guebwiller*, 4690 feet; *le Hobeneck*, 4429 feet; and the *Ballon d'Alsace*, 4101 feet. The length within the French boundaries of the V. M. is 100 miles. They are

covered with forests, and abound in rock-salt, silver, copper, lead, and coal.

VOSS, JOHANN HEINRICH, one of the foremost classical writers of Germany, was born in 1751 at Sommersdorf in Mecklenburg, of poor parents. In 1772, he went to the university of Göttingen, and there joined the 'Hainbund,' an association of young poets, at the head of whom stood Bürger and Boje. V. first intended to devote himself to theology, but soon exclusively turned to Greek and Roman antiquities, under Heyne's auspices. In 1778, he went from Wandsbeck, whither he had gone for the purpose of editing the *Musenalmannach*, to Otterndorf, in Hadeln, where he prepared his translation of the *Odyssey*. This appeared in 1781, and was received with universal applause. In the next year he became rector of Eutin, whence, in 1789, he issued his German translation of Virgil's *Georgics*. This was followed, in 1793, by a new and revised edition of the German *Odyssey* and *Iliad*, which, however, did not meet with as favourable a reception as the first. His contests with Heyne (q. v.) gave also rise chiefly to his *Mythological Letters*, which appeared in 1794. Among his purely German poetical works, *Luise*, an Idyll (1783, revised 1796), takes a foremost place. In 1799, he issued the whole of Virgil in a German translation. In 1802, he went to Jena, where he wrote the celebrated review of Heyne's *Iliad*. In 1805, he was called to Heidelberg, where he wrote annotated German translations of Horace, Hesiod, Theocritus, Bion, Moschus, Tibullus, and Lygdamus. In 1821, he published a translation of Aristophanes, and a new edition of Horace and Virgil. Among other literary labours must also be mentioned his translation (with the aid of his two sons) of Shakspeare's works, which, however, is very inferior to Schlegel's. In opposition to Creuzer's *Symbolik*, he wrote an *Antisymbolik* (1824), in which he lifted up his voice against exaggerated praises of heathen mysticism; and one of his last papers was a violent denunciation of his former friend Stolberg, who had turned Roman Catholic. He died at Heidelberg in 1826. Among his translations from modern languages may be mentioned that from Galland's *Arabian Nights*, and that of Shaftesbury's works. A brief mention may also be made of his two sons: (1) HEINRICH, born 1779, a philologist of merit, who assisted his father in his Shakspeare translation, and who was a great friend of Jean Paul's. He had intended to edit the latter's works, but died before him, in 1822. (2) ABRAHAM, born at Eutin, Professor of the Gymnasium at Kreuznach, who completed the Shakspeare translation. He died in 1847.—See Paulus, *Lebens- und Todeskünden von J. H. Voss* (Heidel. 1826).

VOSSIUS, GERARD, one of the most distinguished scholars of the first half of the 17th c., was born of Dutch parents near Heidelberg, where his father was a Protestant minister. His father's name was John Voss, but he, after the fashion of the time, had Latinised it into Johannes Voesius, and hence his son called himself Gerardus Johannis V., that is, Gerard, the son of John. In 1578, the family returned to Holland, and settled at Dordrecht, where V. went to school. He afterwards distinguished himself at the university of Leyden; and when 22, he returned to Dordrecht, to become the principal of the school, of which he was the most distinguished pupil. He married shortly afterwards, but his wife died in 1607, leaving a family of three children. In the same year, he again married, and by his second wife he had two sons and five daughters. In the earlier part of his life, V. does not appear to have published much, but he became known to his countrymen as a scholar and theologian; and his assiduity

in study may be inferred from the fact that he would never allow a friend to stay with him more than a quarter of an hour. In 1614, he became principal of the theological college of Leyden, and while holding this appointment, published a work on Pelagianism (*Historia Pelagiana*). In it he spoke of the Arminians in an apologetic tone, and thereby brought down upon himself the wrath of a large section of the Dutch clergy; which caused him to be deprived of his office in the theological college, and of the income derived from it. His work had attracted attention in England, and it was some compensation to him that he received from Archbishop Laud an office which brought him £100 a year without its being necessary he should live out of Holland. Chiefly, it appears, to secure the means of supporting his family, he retracted the opinions he had expressed, in his book *De Historicis Latinis*, published in 1627, and he became reconciled to the church. In 1633, he was appointed Professor of History in a new university at Amsterdam, where he seems to have devoted himself to the completion of the great works on which his fame rests. Among the most important of these not mentioned above were: *Aristarchus sive de Arte Grammatica, Libri VII.*; *De Historicis Græcis, Libri IV.*; *Commentariorum Rhetoricorum sive Oratoriarum Institutionum, Libri VI.*; *De Veterum Poetarum Temporibus, Libri II.* In 1649, V. was climbing the ladder of his library when it broke; he fell under the shelves and books, and died of the injuries he received.

The children of V. were remarkable for beauty, accomplishments, and learning. Grotius said of V. in epigrammatic Latin, that it was doubtful whether by his books or his children he had contributed most to adorn the age. Five of his sons, Denis, Francis, Gerard, Mathew, and Isaac, are known as authors.

VOSSIUS, ISAAC, a scholar and theologian, was the only son of Gerard Vossius who survived him. He was born at Leyden in 1618. When 21, he published an edition of the *Periplus* of Scylax, the Greek geographer, with a Latin translation and notes. He afterwards travelled in Italy, collecting valuable manuscripts. In 1648, he took up his abode at the court of Queen Christina of Sweden; but in 1658, in consequence of a quarrel with Salmasius, he returned to Holland. In 1670, he came to England, and here, although he openly scoffed at religion, he was appointed by Charles II. a canon of Windsor, and had apartments assigned him in the Castle. He died there in 1688, and it is recorded that on his deathbed he refused to take the sacrament, until one of his colleagues argued that he ought to do so for the honour of the chapter. His works are numerous, but not so important as those of his father.

VOTERS, ABDUCTION OF, is an offence punishable by fine or imprisonment, and by a penalty of £50 besides, which may be sued for by an informer. The offence is included under the head of undue influence, and by the 17 and 18 Vict. 102, s. 5, is defined to be, the directly or indirectly making use of, or threatening to make use of, any force, violence, or restraint, in order to induce or compel such voter to refrain from voting at any election.

VOTIVE (Lat. *votivus*, given in virtue of a vow; Fr. *votum*, a vow), in ecclesiastical use, signifies the class of actions, offerings, or memorial records or observances, which are intended either as the fulfilment of a vow, or as a commemoration of the accomplishment of the prayer which accompanied the vow. Of such votive engagements there are numerous examples in the Old Testament (Levit. xxiii. 18, Deut. xii. 6), as well as in the ancient

religions of the Gentile world; and the ecclesiastical historian Theodoret (*De Cur. Græc. Affect.*, i. 8) alludes to the practice in his own day of hanging up, in the churches dedicated to the saints, little models of hands, feet, eyes, &c., in votive commemoration of the cure of lameness, blindness, and other maladies supposed to have been obtained through their intercession. The same practice continued throughout the succeeding centuries and throughout the mediæval period, and still prevails in Roman Catholic countries, especially in Italy and Southern Germany. Votive offerings, often of very considerable value, may be seen in the churches of most of the great Sanctuaries (q. v.), and in other churches in special repute as places of devotion. The offering very frequently takes the form of a votive tablet, with an inscription detailing the event on which it is founded. Sometimes the offering is simply marked with the words *ex voto*, 'in fulfilment of vow'; sometimes it is accompanied by a model in wax, in wood-carving, or even in precious metals, similar to those alluded to by Theodoret; and occasionally by a model of some object, which is meant to recall the memory of the favour received, as of a ship, in case of escape from shipwreck, &c. Many of the great churches, hospitals, monasteries, and other religious monuments of the middle ages and of later times, were built *ex voto*; and the treasures of most of the rich cathedrals and other churches abroad contain objects of great value, the result of votive engagements on the part of the donors. The name *votive* is also applied in the Roman Catholic Church to the mass or other service, when it is celebrated—as is permitted on certain days and in certain seasons—not according to the rite prescribed for the day itself, but according to a rite selected by the celebrant himself from a number of such 'votive masses' and 'votive offices,' as 'of the Passion,' 'of the Holy Trinity,' 'of the Blessed Virgin Mary,' &c., which are contained in the Missal and Breviary.

VOUSSOIRS, the individual stones forming an arch, and of which the central one is the keystone. They are always of a truncated wedge-form.

VOW (Fr. *vœu*, from Lat. *votum*), a promise made to God of a certain thing or action good in itself, and within the dominion and right of the person promising. The practice of vows appears to have formed part of the religious observance of almost all races in any degree civilised; and it largely pervaded the whole ceremonial system of the Mosaic dispensation (Gen. xviii. 20, Lev. xxvii. 2, 1 Chron. [I. Paralip. Vulg.] xxix. 3, 2 Chron. xxxi. 6, Judges xi. 30, Num. xxx. 2, Judith xvi. 19, Jon. i. 16). The stringency of the obligation of fulfilling a vow when once made, is distinctly laid down (Deut. xxiii. 21; Eccles. v. 4, 5); but it is equally clearly stated, that it is by no means a matter of obligation to make a vow (Deut. xxiii. 22). The practice of making vows continued among the Jews in the time of our Lord; and St Paul, after his conversion to Christianity, continued to conform to this usage (Acts xviii. 18). It would be out of place to enter here into the question, whether this observance was meant by our Lord to form part of his new dispensation, or to discuss how far the practice of vows, especially of chastity, can be traced as in use among the Christians of the first and second century; but it appears quite clear that in the end of the third, and all through the fourth, the monastic life became general in the East, and soon afterwards spread all over the church. See ANTONY, PAUL, MONACHISM. It is unnecessary to add, that vows, while discarded as a religious observance by the Reformers, enter largely into the system of the Roman Catholic

Church. The objects of these engagements among Catholics are very various; but they are drawn, for the most part, from what are called the evangelical 'counsels,' in contradistinction to 'precepts' or 'commands'—the most ordinary subject of vows being the so-called 'evangelical' virtues of poverty, chastity, and obedience. Pilgrimages, however, acts of abstinence, or other self-mortifications, whether of the body or of the will, special prayers or religious exercises, are frequently made the object of vows; and there is another large class of more material objects, as the building of churches, monasteries, hospitals, and other works of public interest or utility, to which mediæval Europe was indebted for many of its most magnificent memorials of piety and of art. Vows in the Roman Church law are either 'simple' or 'solemn.' The principal difference between them consists in the legal effects of the 'solemn' vow, which, where the subject of such vow is chastity, renders not merely unlawful, but null and void, a marriage subsequently contracted. A 'simple' vow of chastity makes it unlawful to marry, but, except in the Jesuit Society, does not invalidate a marriage, if subsequently contracted. Catholics acknowledge in the church a power of dispensing in vows; but this is held to be rather declaratory than remissory, and it is not acknowledged in the case of vows which involve any right of a third party. Bishops are held to possess the power of dispensing in simple vows generally; but the power of dispensing in solemn vows and in certain simple vows, as, for example, that of absolute and perpetual chastity, and of the greater pilgrimages, is reserved to the pope. The practical operation of the canon law regarding vows has evidently been much modified, even in Catholic countries, since the French Revolution, and the subsequent political changes; but this must be understood to regard chiefly their external and purely juridical effects. So far as concerns their spiritual obligation, the modern Roman theology recognises little if any change.—See Ferraris, *Bibliotheca Canonica*; André, *Cours de Droit Canon*; Welter and Wetze's *Kirchen-Lexicon*.

VOWEL. See LETTERS.

VRĪHASPATI, or, as the word is written in Vedic works, **BRĪHASPATI** (from *br̥iḥ*, probably hymn, prayer, and *pati*, protector, lord), is, in Vedic Mythology, the guardian of the hymns or prayers addressed by the pious to the gods, and he is therefore considered as mainly instrumental in insuring the efficacy of the sacrifice. In consequence, he is 'the first-born in the highest heaven of supreme light,' because the prayers reach him first; he is 'seven-faced,' because his faces are the seven Vedic metres; and he is 'attended by all the companies of gods,' or 'represents all gods,' when the sacrifice is performed. Being thus the 'first sharer of the offering,' he is sometimes also identified with *Agni*. His function of guardian of the hymns being similar to that of a priest and spiritual teacher, he is further represented as a priest of the gods, who himself 'celebrates worship;' as 'the observer of truth,' and as imparting 'virtuous instruction.' In the epic and Purāṇic mythology, V. figures especially as preceptor of the gods and R̥ishis, and as such he also causes them to perform sacrifices. A new character, however, in which he appears at that period is that of regent of the planet Jupiter; and in the ceremonies performed in honour of the planets, and described in several Purāṇas, a special worship is paid him in this capacity.

VRĪTRA. See INDRA.

VULCAN (the name is probably connected with *fulgere* and *fulgur*, and may be translated the 'bright

or shining one') was the old Italian god of fire. The various myths in connection with V. prove the great antiquity of his worship. Latterly, the character, attributes, and history of the Greek Hephestus were transferred to V., and the two thus became identified. According to Homer Hephestus was the son of Zeus and Hera; later accounts, however, asserting that the latter gave birth to him without any co-operation on the part of her husband. He appears to have been twice violently expelled from Olympus—the first occasion was shortly after his birth, when he was dropped upon the earth by his mother, who was disgusted with his sickly deformity; he was received by the marine divinities, Thetis and Eurynome, with whom he dwelt for nine years. He afterwards returned to Heaven, and on interfering in a quarrel between his mother and Zeus, the latter seized him by the leg, and flung him from Olympus. After falling for a whole day, he alighted on Lemnos, where he was kindly received by the Sintians. He afterwards returned to Olympus. Homer makes him lame from his birth, while later writers attribute this

Vulcan.

defect to his second fall on Lemnos. The popular notion of V. or Hephestus appears to have been that of a burly, lame, good-natured, awkward god, often made the butt and laughing-stock of his fellows. He had a magnificent palace of his own in Olympus, 'immortal, brazen, shining like stars,' in which was his workshop, containing an anvil and 20 bellows, which worked at his command. Later accounts locate his workshop in the interior of some volcanic isle, such as Lemnos, Lipara, Sicily, &c., and give him as workmen the Cyclopes, Brontes, Steropes, &c. Many wonderful works of art are ascribed to V. by the ancient poets, and as an artist or artificer, he appears to have been regarded as corresponding in some respects to Athene: both instructed men in the useful and ornamental arts, had the power of healing, &c., and at Athens, had temples and festivals in common. In the *Iliad*, the wife of Hephestus is Charis; while in the *Odyssey*, and in later writers, he is represented as being much tormented by the amours of his frail and charming spouse Aphrodite, with her favourite Ares (Mars). In the earlier statues, his lameness appears to have been indicated; but latterly, he was represented as a full-grown, vigorous man, with a beard.

VULCANISM, a term proposed by Humboldt to include all the evidences of internal heat, such as volcanoes, hot springs, &c.

VULCANITE AND VULCANISED INDIA-RUBBER. See CAOUTCHOUC.

VULGATE is the name of a well-known Latin translation of the Old Testament, done by Jerome,

who, when engaged in correcting the Itala (see ITALIC VERSION), conceived the plan of producing a completely new version, done from the Hebrew text itself. He commenced this labour about 385 A. D. (with the books of Samuel and Kings), and completed it in 405. This new version, although not free from the reproach of casual hastiness, and faulty and insufficient exegetical knowledge, yet surpassed all previous ones in general correctness and accuracy; a circumstance which did not fail to bring Jerome into bad odour. The discrepancies between the V. and the Itala, which had been made from the LXX., were so numerous and important, that the charge of heresy and falsification of Scripture was openly preferred against the translator by Rufinus, and even St Augustine was doubtful for some time whether this charge might not be true. But gradually it made its way in the church, first in Gaul, then in Rome—chiefly through Gregory the Great—and finally throughout the West. About 200 years after Jerome's death, it became the universally received version of the church. Not long, however, did it exist in its pure and unadulterated form. Partly through the influence of the emended Itala, partly through the manifold general causes of neglect, hastiness, and the rest, which have gone so far to spoil almost every ancient MS., the text of the Vulgate had become so corrupted, that in 802, Charlemagne commissioned Alcuin to revise it by old MSS., and to compare it with the Hebrew text. This revision, however, to which afterwards came other 'emendations,' in the 11th and 12th c. (by Lanfranc, Archbishop of Canterbury, and Cardinal Nicolaus respectively), completely changed the original character of the work. Nor did the 'Correctoria Biblica' (i. e., certain collections of commented and revised texts, issued at the period), do much for the improvement of the corrupted MSS. The confusion between the different codices was chiefly remarked, when the Tridentine Council, in 1546, first declared the V. the authorised version of the Roman Church, and decreed the preparation of an authenticated edition. In 1564, the Papal Chair undertook the task; but not before 1590 did Sixtus V. produce the work. This, however, turned out to be so utterly incorrect and faulty throughout, that the copies were speedily suppressed; and another edition, which appeared in 1592, was prepared under Clement VIII., to which in the next year (1593) that other edition succeeded, which has since remained the normal edition of the Church of Rome, and has been reprinted unchanged ever since. We may add, that the Anglo-Saxon translation of the Pentateuch and Joshua, by Aelfric (10th c.), has been made from the V., and not, as has been erroneously supposed, from the Septuagint; and that the V. has also been repeatedly translated into Arabic (the Psalms even into Persian) for the use of the Roman Catholics in the East.

VULNED, a heraldic term, applied to an animal, or part of an animal—as, for example, a human heart, wounded, and with the blood dropping from it. A pelican in her piety (see PELICAN) is sometimes described as vulning herself.

VULTURE (*Vultur*), a Linnæan genus of rapacious birds, now forming the family *Vulturidae*, to almost all the species of which the name V. is popularly given. The *Vulturidae* have a longer beak than the *Falconidae*, and it is straight at the base, slightly or not at all toothed, the upper mandible longer than the lower, and hooked at the tip, the head generally bare, or covered only with a short down, which in most of the species is the case also with the neck—a ruff or collar of soft feathers surrounding the lower part of the neck, into which

the upper part, and even most of the head, can be withdrawn. The legs and feet are large, but the claws are not nearly so large and strong as in the *Falconidae*, and are but slightly hooked. The middle toe is very long. The wings are long, and their expanse consequently great. Vultures have great powers of flight, and many of them soar to a very great height in the air. Their plumage has not the neat and regular appearance of that of the *Falconidae*, but it is dense, and not easily penetrated by shot. Vultures are mostly found in warm climates, and many of them are inhabitants of

King Vulture (*Vultur papa*).

mountainous regions. They feed on carrion, which it seems to be their office in nature to remove from the face of the earth, that the evil consequences of its corruption may be prevented. They seldom attack a living animal, but they have been seen to sit and watch the approach of death, waiting for their feast. They are not in general courageous birds, and are often put to flight by birds much smaller than themselves; yet, if unmolested, they readily become familiar with the presence of man, and some of them seek their food even in the streets of towns, in which they are useful as scavengers. They gorge themselves excessively when food is abundant, till their crop forms a great projection, and sit long in a sleepy or half-torpid state to digest their food. They do not carry food to their young in their claws, but disgorge it for them from the crop. The bareness of their head and neck adapts them for feeding on putrid flesh, by which feathers would be defiled; and they are very careful to wash and cleanse their plumage. The question has been much discussed, whether vultures discern dead animals by the eye, or are attracted to them by the smell. It is certain that they possess great powers both of smell and of vision, and the reasonable conclusion appears to be that both are of service in directing them to their prey. The rapidity with which they congregate to a carcass has been remarked with admiration, and vast numbers have often been seen assembled on a battle-field to devour the dead.

The *Vulturidae* are divided into several genera, of which one, *Gypaetos*, approaches to the *Falconidae* in its characters and habits, having the head feathered, and not always feeding on carrion, but often attacking living animals. The Lämmergeier (q. v.) is one of this group. The feet are feathered to the toes, whilst the other vultures have the tarsi bare.

Some of the most notable species of V. have already been described, as the Condor and the

Egyptian Vulture. The generic name *Vultur* is now restricted to those which have the head and neck without feathers and without caruncles, and a ruff of long feathers or of down at the lower part of the neck. To this genus belongs the TAWNY V., or GRIFFON (*V. fulvus*), found in the south of Europe, the north of Africa, and the west of Asia. It makes its nest on the most inaccessible rocks of high mountains, as in the Alps and Pyrenees, and sometimes in tall forest trees. It is a very large bird, more than four feet in length. Its plumage is yellowish brown, the quills and tail-feathers blackish brown, the down of the head and neck white, the ruff white. When it has found a carcass on which to feed, it remains on the spot, gorging and torpidly resting by turns, till no morsel remains. This V. has been seen in England, but only as an accidental visitor. The mountains and forests of the south of Europe, as well as of the north of Africa, and great part of Asia, are also inhabited by the CINEREOUS V. (*Vultur* or *Gyps cinereus*), another large species, which departs from the typical character of the vultures in having the greater part of the neck feathered, and comparatively large and powerful claws. It does not, however, attack living animals. India, Africa, and almost all warm countries, abound in vultures of different species, which it is unnecessary to describe. In the southern states of North America is found the BLACK V. (*Cathartes atratus*), there generally known as the CARRION CROW, a comparatively small species, not quite two feet in entire length, of a deep black colour, the head and neck covered with warty excrescences, and a few hair-like feathers. This bird is also very abundant in many parts of South America, where it is called the GALLINAZO. Very nearly allied to it, and found in the same regions, is the TURKEY BUZZARD, or RED-HEADED V. (*Cathartes aura*). These vultures are more or less gregarious,

Turkey Buzzard (*Cathartes aura*).

not only assembling where food is to be found, but flying in flocks. They make their nests in hollow trees, and sometimes in the chimneys of deserted houses, or on the roofs of houses. In some of the towns of tropical America, they may be seen in great numbers, perched during the heat of the day on the tops of houses or on walls, asleep, with their heads under their wings. The CALIFORNIAN V. (*Cathartes Californianus*) is the largest rapacious bird of North America, being fully four feet long, and about ten feet in extent of wings. It is black, with a white band on the wings. It is found only on the western side of the Rocky Mountains. It much resembles the condor in its habits.

VYĀSA is the reputed arranger of the Vedas (q. v.), and the reputed author of the Mahābhārata (q. v.), the Purān'as (q. v.), the Brahmasūtras (see VEDĀNTA), and a Dharmas'āstra. According to tradition, he was a son of the sage Parāśara and Satyawatī, 'the truthful,' who was a daughter of King Vasu, and a heavenly nymph, Adrikā. Another tradition makes him also the father of Dhṛitarāshṭra, Pān'du, and Vidura. On account of his dark complexion, he was called Kṛishn'a (black); and because he was born in an island (*dvīpa*) of the Yamunā (Jumna) river, his second name was *Dvāpāyana*. That the immense bulk of literature comprised by the above-named works, and relating to different periods, cannot belong to the authorship of one and the same personage, is no matter of doubt. But the name itself of the individual to whom it is attributed conveys the meaning which must be sought for in some of the legends connected with his history. *Vyāsa* (from the Sanscrit *vi* and *as*, literally, 'throw in different directions,' hence 'distribute') means the person who arranges a subject-matter in a diffuse manner, or the act itself of such a diffuse arrangement, and is often contrasted with *samāsa* (from *sam* and *as*, con-tract), the act of making a concise arrangement, or of abridging (compare the Greek *omēro*, from *om* = *sam* = *sun*, and *ar* = *as*). *Vyāsa* is, therefore, a symbolical

representation of the work of generations, as embodied in the Vedas, the Mahābhārata, and the Purān'as, and of the order which gradually was brought into this literary mass. When, therefore, the Višn'u-Purān'a speaks of 28 Vyāsas who in the reign of the present Manu arranged the Vedas, it is not impossible that some historical truth may underlie this statement, implying, as it does, a different arrangement of the Hindu scriptures at various times: and that the Mahābhārata, and the Purān'as too, may have undergone various arrangements and recensions, until they settled down in their present form, sufficiently results from their contents. Regarding the Brahmasūtras, tradition itself seems only loosely to connect their author with the Vyāsa of the foregoing works, for it says that he was in a former life a Brāhman, *Apāntarātanā*, who, after having attained final beatitude, 'by special command of the deity, resumed a corporeal frame and the human shape, at the period intervening between the third and fourth ages of the present world, and was the compiler of the Vedas.' (See Colebrooke's *Miscellaneous Essays*, vol. i. p. 327, Lond. 1837.) As the author of the Dharmas'āstra, V. is possibly a personage distinct from the legendary individual bearing this name, as is the case with other Vyāsas who occur as authors of other works.

W

THE twenty-third letter of the English alphabet, 'is a letter which performs the double office of a consonant and a vowel. According to the decisive experiments of Professor Willis (*Cambridge Phil. Trans.*, iii. 231),

the natural order of the vowels is *i, e, a, o, u*, or the reverse; in which the sounds must be understood to be those which prevail on the continent. The sounds, then, of *i* (that is, *ee*) and *u* (that is, *oo*) are the most remote, and the attempt to pass with rapidity from either of these to the others, more particularly to the other extreme, gives an initial breathing which has the character of a consonant, viz., in the one case, *ee-oo*, or *you*; in the other, *oo-ee*, or *we*.' See Key's *Alphabet*. This acute analysis of the articulations denoted by the characters *w* and *y*, throws a clear light on the double function they perform as consonants and as vowels. The letter *w*, which originated in the middle ages, is merely one *v* joined to another, as its English name imports. It is peculiar to the English, German, and Dutch alphabets. It would appear from a variety of phenomena in Latin and Greek, that the Lat. *v* or *u*, used as a consonant, as well as the old Greek digamma (Φ), were more of the nature of the modern *w*, than of the decidedly consonantal English *v* (see U and V). The French, having, like the other Romanic nations, no character *w*, express the sound by prefixing *ou* to the vowel; as *oui* (pron. *wee*), *Edouard* = Edward. In the beginning of proper names they substitute *gu*; e. g., *Guillaume* = William. The Spaniards also use *gu*, as in many names compounded of the Arabic *wadi*; e. g., *Guadalquivir*; but more frequently *hu*, as in *Chihuahua* (pron. *Chiwawa*). In High-German, which has become classical German, *w* is confounded with *v*, and *v* with *f*; thus, *Wellington* is pronounced *Fellington*. In London, *w* is substituted for *v*, and *v* for *w*, with 'a most amusing perversity.'

WAAL, THE (Lat. *Valis* or *Vahalis*), an arm of the Rhine, thrown off near the village of Pannerden, in the Netherlands, flows thence to Nijmegen, Tiel, Nieuw-St-Andries, between the Boemmeler- and Tieler-ward, and unites with the Maas below Fort Loewestein (Luwestein). The united rivers then take the name of the Merwede, which, flowing past Gorinchem and Dordrecht, becomes the Oude, or Old Maas. See MAAS.

WA'BASH, a river of the U. S. of America, rises in Western Ohio, runs west and south-west through Indiana, forming the southerly half of its western boundary, on the borders of Illinois, to the Ohio River, 146 miles from its mouth, is 550 miles long, and navigable by steamers at high-water 300, and has for its principal branches the Tippecanoe, Big Vermilion, Embarras, and White River—the last 200 miles long. The Wabash and Erie Canal connects the lakes with the Mississippi.

WACE, ROBERT, an Anglo-Norman poet of the 12th century. Many different versions of his name are given in his own books, as well as in the other books which mention him. He is styled Vace, Wace, Waece, Waice, Waicce, Waze; Gasse, Gaice, Guace, Guazi, Guase, Guascoe, Gazoe; and again, Wistace, Huistace, Huace. It has been supposed that there were really two poets, the one named Wace or Guace, the other named Wuistace; the one the author of *Le Roman du Rou*, the other of *Le Roman du Brut*. But variety in writing names was very common in the middle ages, and it does not seem necessary to resort to this supposition. About his Christian name there is even more doubt than about his surname. It is never mentioned in his poems, from which the little that is known about him is mostly derived. An old writer speaks of him as Matthew; and it seems that he was first called Robert in the *Origines de Caen* by Huet, whom subsequent authors have followed.

W. was born in Jersey, in the reign of Henry I., and it is probable that the date of his birth lay between the years 1112 and 1124. He was taken to Caen as a child, and there he received the early part of his education. He was afterwards sent into the neighbouring kingdom of France; but he returned to Caen, and having entered into holy orders, became a reading-clerk in the Royal Chapel there. At Caen it was that he composed his works. Henry II., to whom he dedicated *Le Roman du Rou*, gave him a canonry at Bayeux, apparently about the year 1160. He died in England about the year 1180, certainly before the year 1184.

Five separate works are attributed to W.; but three are slight, short performances, and it is only necessary to notice the two principal—*Le Roman du Brut d'Angleterre*, and *Le Roman du Rou*. The former premises that a certain Brutus, a son of Ascanius, and grandson of Æneas, settled in Britain, and became its first king. The book continues the history of the British kings from Brutus to Cadwallader, who died at Rome shortly before the year 700. It is little more, however, than a literal translation into the French from the Latin of Geoffrey of Monmouth (q. v.). This poem seems to have been completed in the year 1155. *Le Roman du Rou* (Rollo) is a sort of history of the Dukes of Normandy and of the Norman monarchy in England. Neither of these works has the slightest poetical merit. They are both interesting only as showing the state of the French language in the 12th c., and as supplying occasional facts and social traits to the historian.

WA'OKÉ, a German miners' term, introduced by Werner, to designate a soft variety of trap, that has an argillaceous aspect, and a greenish-gray colour. It resembles indurated clay, but has been formed of volcanic ashes or mud. It is often vesicular, and when the cavities are filled, it becomes an amygdaloid. It is associated with trappean rocks, and, indeed, often passes into basalt or greenstone.

WAD, the popular name given in some parts of England, as in Derbyshire, to an ore of manganese, which is a hydrated peroxide, united with nearly its own weight of oxide of iron. Wad is also the provincial name of black lead or plumbago in Cumberland.

WAD, in Gunnery, a compressible disc forced home in the barrel after the powder, to confine the latter to the least possible space before its explosion. For great guns, the wad is commonly made of rope; for small-arms, of pasteboard.

WADERS, or WADING-BIRDS, a designation often applied to the whole order of birds *Grallae*

Characteristic Features of Wading-birds :

1, Head and foot of Common Snipe; 2, Head and foot of Ringed Dotterel; 3, Head and foot of Common Godwit; 4, Head and foot of Curlew.

(q. v.), or *Grallatores*, but really appropriate only to some of them, the more aquatic in their habits, as Herons, Snipes, and Rails.

WADHAM COLLEGE, Oxford. In the year 1610, James I. issued a licence to Dorothy Wadham, acting as executrix of the will of her deceased husband, Nicholas Wadham, Esq., to found a 'College of Divinity, Civil and Canon Law, Physic, good Arts and Sciences, and the Tongues.' Dorothy Wadham purchased the site and ruins of the priory of the Austin Friars, in the suburbs of Oxford, and built the present college for a warden, 15 fellows, 15 scholars, and 2 chaplains. The fellows were formerly elected from the scholars, and the tenure of the fellowships was limited to 22 years; nine of the scholarships were limited to certain counties, and to the founder's kin. By the Commissioners under 17 and 18 Vict. c. 81, the fellowships and scholarships were thrown open—the former to all persons who had passed the examinations for a B.A. degree; the latter to all persons under 20 years of age. The Commissioners also abolished the limitations on the tenure of the fellowships. One of the fellowships is appropriated to the reader in experimental philosophy. The value of the fellowships is supposed to be about £160 a year. The scholarships are worth £48 a year, besides rooms, and are tenable for five years. There are several good exhibitions, especially those founded by Dr Hody—four for Hebrew, and six for Greek, value £40 a year, and tenable for four years; also a law exhibition for a fellow, value £90 a year; and a medical exhibition for a fellow, of the same value. There are ten benefices in the gift of this college.

WADI, an Arabic word signifying a river, a river-course, a ravine, or valley. It is supposed that the

Greek *oasis* is a corruption of *wadi*. It is of frequent occurrence in the names of places; e. g., Wadi-Musa (i. e., the Valley of Moses) in Arabia. In Spain, where most of the rivers bear names given them by the Arabs, *wad* has been transformed into *guad*; e. g., Wadi-l-abyadh (the white river) has become Guadalavivar.

WADSET, in Scotch Law, is the old name for a Mortgage (q. v.). The modern name is Bond and Disposition in Security. See HERITABLE SECURITIES.

WAFER, in relation to the Roman Catholic usage of the Eucharistic communion, is the name given (chiefly by non-Catholics) to the thin circular portions of unleavened bread which are used in the Roman Church in the celebration and administration of the Eucharist. In ancient times, the bread and wine for the Eucharist were contributed by the faithful; and a place is found in the Eucharistic service of every known liturgy for this offering, still known by the name of Offertory (q. v.). But in the Latin Church, for many centuries, the bread (which, as being unleavened, and different from that in common use, needed special preparation) has been provided by the clergy; and the practice has been followed of preparing it in the form of thin cakes, commonly, although not necessarily circular, and frequently impressed with sacred representations or emblems, as the Crucifixion, the Lamb, the Christian monogram, the Cross, and other sacred symbols. The circular form itself is by some ritualistic writers regarded as symbolical, the circle being a figure of perfection. The wafers used in the Roman Catholic Church are made of different sizes, the smallest about an inch in diameter for the communion of the people, a second considerably larger for the celebration of the mass, and a third still larger to be placed in the Monstrance (q. v.) for the service of benediction or exposition. See LORD'S SUPPER.

WAFERS, thin discs of dried paste, mostly coloured, used for sealing letters, or for attaching papers together. They are made by mixing fine wheaten flour with water and any non-poisonous colouring materials, so as to form a mixture not thicker than thin cream. A small quantity of this is poured on the lower limb of a pair of wafer-irons, which are formed like a pair of pincers, but with flat blades about 12 inches long by 9 in breadth, the inner surface of which is kept well polished. Before being used, they are heated over a charcoal or coke fire; and the liquid paste being poured on the lower blade, the pressure of the two blades distributes it equally in a thin sheet between them, the superfluous material being squeezed out at the sides, from which it is shaved off by means of a knife. In a few seconds of time, if the blades are hot enough, the sheet of paste becomes dry and half baked. The sheets so formed are then stamped out into discs of the sizes required. Formerly, wafers were very extensively used, and their manufacture was one of considerable importance; but the introduction of gummed envelopes has almost driven them out of use.

WAGENINGEN, an old but well-built town in the Netherlands, province of Gelderland, is situated near the Rhine, to which access is had from it by a canal. Pop. 5632. W. has good schools and other useful institutions. The environs are beautiful, and the Wageningsche Berg, now formed into a burying-place, is especially picturesque.

Ship-building, brick and tile making, tanning leather, rope-spinning, &c., with agriculture, are the chief sources of wealth. W. received the rights of a town in 1263. It is a neat, purely Dutch town,

selected as a residence by many who wish to live quietly, comfortably, and economically.

WAGER OF LAW, in the Law of England, was an old form of giving sureties that at some future time the party would wage his law—that is, put it to the oath of the defendant, who swore in presence of eleven compurgators as to the debt claimed. The action was used in causes where there was some secrecy as to the origin of the debt, or where the defendant bore a fair character. That form of action had long been in disuse, but was not formally abolished till the statute of 3 and 4 Will. IV. c. 42.

WAGERS, in the Common Law of England, were held good, if they were not against the principles of morality, public decency, or sound policy; and a wager or bet was defined to be, a contract entered into without colour or fraud between two or more persons for a good consideration, and upon mutual promises to pay a stipulated sum of money, or to deliver some other thing to each other, according to the result of some contingency. A wager has been held void which was made on the life of Napoleon I., on the result of an election of a member to serve in parliament, &c. Before the statute of 8 and 9 Vict. c. 109, wagers above a certain amount were declared to be illegal, but now wagers on a race are not illegal. That statute provides that all contracts or agreements, whether by parol or in writing, by way of gaining or wagering, shall be null and void, and the money due thereon cannot be recovered in any court of law; but that enactment does not apply to any subscription or contribution or agreement to subscribe or contribute for any plate, prize, or sum of money to be awarded to the winner or winners of any lawful game, sport, pastime, or exercise. If a sum of money has been deposited with a stakeholder, not as a stake, but by way of wager, it may be recovered back if notice is given to the stakeholder before the event comes off. As no wager can be recovered in a court of law, it is merely a debt of honour, and if paid, it is in the eye of the law the same thing as giving a gratuity. If a promissory-note or bill of exchange be taken as security for money either won by betting or knowingly lent for betting, the consideration is illegal, and the money cannot be recovered. A recent act was passed for the suppression of betting-houses, and imposes penalties on persons keeping or using houses for betting purposes (17 and 18 Vict. c. 119); and justices may authorise constables to break into such houses, and arrest all persons found therein. Whoever by a cheating wager wins money from another, is liable to be indicted for obtaining the money by false pretences.—In the Law of Scotland, wagers are treated as *pacta illicita*, which it is beneath the dignity of any court to entertain questions about, and so they are not recoverable by action. The act 8 and 9 Vict. c. 109 does not apply to Scotland, but there are older statutes of a somewhat similar effect.

WAGES means the money given for personal services, as distinct from the price of anything sold, whether made by the seller or not. When a man makes a basket, and sells it, the price is not wages, though it may be the same thing to him. The term has by general usage been limited to the remuneration of hand-working. A manager of a bank or railway—even an overseer or a clerk in a manufactory, is said to draw a salary. It is generally a feature of wages, too, that they are paid at short intervals, as being necessary for immediate support. This division is connected with social distinctions which have exercised a baneful moral influence in the direction of improvidence. The

clerk at a hundred a year is supposed to be a gentleman who dresses decently, and so adjusts his expenditure that he can draw it quarterly. The puddler or shingler who can make a guinea a day is, by traditional usage, a member of the needy classes, who requires to draw his wages weekly, and is expected to spend them at once. Wages are more absolutely ruled by their value in the market than other services. A writer of poems or a painter of pictures does work which is exceptional—if people are willing to pay him any price he may ask for his work, there is probably no one who can compete with him and undersell him. A lawyer or a physician may also have special qualities to a great extent excluding competition; and in appointments to offices requiring trust, judgment, and skill, a great many things have to be considered besides the question, who will do the duty cheapest? But in the staple hand-works—the making of clothes, the baking of bread, and the like—there are uniform functions of the hand which a certain number of persons will always be found ready to give for a price. Strong efforts are made from time to time—by combinations, strikes, &c.—to make wages fictitiously high. These efforts are of course often successful for a time, bringing profit to some members of the working-classes, though injury to others, and a general loss of the wealth of the community. But the great law of political economy, that labour as well as all other things, will bring what it is worth, ever prevails in the end in a country where trade and labour are free. See CAPITAL, COMBINATION, LABOUR, TRUCK-SYSTEM.

WAGNER, RICHARD, a contemporary German operatic composer. He was born at Leipzig in 1813, and was educated at Dresden and Leipzig. In 1836, he was *Kapellmeister* at Magdeburg, and after spending some time in Königsberg, Dresden, and Riga successively, he came to Paris in 1841, where he composed his two earliest operas, *Rienzi* and *Der fliegende Holländer*. *Rienzi*, when brought out by him at Dresden, obtained for him the post of *Kapellmeister* there. His next opera, *Tannhäuser*, appeared in 1845, also at Dresden. Being involved in the political schemes of 1848, W. had to quit Saxony, and took up his residence for a time in Switzerland, where he composed *Lohengrin* and *Die Nibelungen*. He spent the season of 1855 in London, where he undertook the direction of the Philharmonic Society's concerts. In 1865, he was invited to Munich, and greatly befriended by the young king of Bavaria, who appointed him Director of the Opera-house; and he there produced his latest opera of *Tristan und Isolde*; but complaints of the royal favourite interfering in state affairs obliged King Ludwig to dismiss him. The public are greatly divided regarding the merits of W.'s operas and the soundness of his æsthetic opinions, one party in Germany looking up to him as the greatest musical genius of the age; another pronouncing his theories utterly visionary, and his music extravagant and unintelligible. W. explains his notions of the opera in a volume of essays, entitled *Oper und die Drama*, published at Leipzig in 1852. Music, poetry, and dramatic effect should, according to him, not be made separate objects, but mutually combine and assist each other. He takes to himself the credit of having reformed the opera by, for the first time, effecting this combination; and his compositions are characterised by himself and his admirers as 'Music of the Future,' or 'Work of Art of the Future.' Some of his operas, particularly *Tannhäuser*, are magnificent as spectacles, but they are altogether deficient in melody. In all of them, the words of the libretto, W.'s own composition, are adapted to a declamatory style of recitative,

relieved by harmonies and instrumentation in accordance with the spirit of the situation. *Lohengrin* has been his most successful work.

WAGON, a vehicle for the conveyance of goods or passengers, is mounted on four wheels, but varies considerably in the construction of its other parts, according to the species of traffic in which it is to be employed. Since the wagon has four wheels, it is quite unnecessary that any part of the weight should be sustained on the shafts, and accordingly these latter are hinged to the fore-part of the frame, so as to be raised or let down at pleasure. Wagons being generally drawn by two horses abreast, two pair of shafts are employed; and when three horses are yoked abreast, the centre one is the shaft horse, the right and left 'wheelers' are yoked by traces to the wagon-frame; and each of the latter is attached by a chain from its collar to a shaft, so as to preserve the parallelism of its action. Most wagons are set on springs, on account of the weight of the vehicle, and the absence of the steadying weight of the horse, owing to the shafts not being immovably attached to the frame. For facility in turning, the fore-wheels are occasionally smaller than the hind ones; and in addition, the fore-axle of the lighter kinds of wagon is attached to the body of the wagon by a swivel-joint, the shafts or pole being in this case attached to the fore-axle; but the diminution of the size of the wheels is open to grave objection, on account of the greater friction. It being almost impossible for the beasts of draught to control and subdue the momentum of a heavily-loaded wagon descending a slope, it is necessary to employ a drag of some sort; the rudest forms of which are a thick cylinder of tough wood inserted between two spokes of the wheel, which, being carried upwards in the wheel's revolution, is 'jammed' against the under side of the wagon-frame, and stops the wheel's rotation; and the *chain-drag*, which was merely a chain firmly fastened at one end to the wagon-frame between a fore and hind wheel, and furnished at the other end with a large hook, to hold the tire of the hind-wheel; the method of chaining the fore and hind wheels together was also employed. But in the better class of wagons, the *shoe* and *break* (see **DRAG**) are now employed. The various forms of wagon in common use are the brewer's *dray*, the railway *lorry*, the agricultural *wain* (in common use in England and on the continent), and the *bullock-cart* of South Africa. The comparative merits of a vehicle in which the horse has merely to draw, and one, as the cart, in which he has to carry as well as draw, have often been discussed, though never sufficiently tested; but it seems to be generally believed that, despite the distress arising from his confined position in the comparatively immovable shafts of a cart, a horse can transport a greater weight to a moderate distance by the same exertion of muscular force in a cart than in a wagon.

WAGON-TRAIN, an indispensable companion of an army under this or some other title. It serves to convey the ammunition, provisions, sick, wounded, camp-equipage, &c. At the present time, in the British army, the Military Train performs this function, although in China (1860) and New Zealand (1862—1865) the commissariat provided and organised its own wagon-service.

WAGRAM, or **DEUTSCH-WAGRAM**, a village of Lower Austria, on the left bank of the Rusebach, ten miles north-east-by-east from Vienna, is of little importance, except as the site of the great battle between the French and Austrians in the campaign of 1809, which forced Austria to bow before Napoleon, and submit to the onerous conditions of

the fourth treaty of Vienna (q.v.). After the capture of Vienna, Napoleon resolved to pass the Danube, and complete the prostration of Austria's military strength by the destruction of her last army—that under the Archduke Charles; and with this view, he called in the Italian army, under Eugene Beauharnois, and all his outlying corps, concentrating them in and about the island of Lobau; and after a few feints, calculated to mislead the Archduke, who, stationed on the north bank, was vigilantly guarding the various crossings, succeeded in effecting a most extraordinary passage, on the morning of July 5, 1809, from the island of Lobau to the north bank, opposite Enzersdorf, landing 150,000 infantry, 30,000 cavalry, and 600 pieces of cannon before six in the morning. When the morning light showed the Austrians how they had been out-maneuvred, they retreated across the plain of the March-field to its northern extremity, and took up a formidable position at W., and being closely followed up, were, on the evening of July 5, attacked by a part of the French army. By the vigorous exertions of the Archduke in person, the assailants—after a temporary success—were completely repulsed, and the Austrians, exulting in their second victory over Napoleon, waited in sanguine expectation the events of the next day. In the morning, the Archduke resolved to assume the offensive, and succeeded at first in defeating the French centre under Massena, and in forcing their left into inextricable confusion, followed by total rout; but at the same time his own left was turned by Davout, and this success followed up by a successful attack of Macdonald on their centre, forced the Austrians to retreat, which they did in the most orderly manner, carrying with them 5000 prisoners, and leaving 25,000 dead or wounded on the field of battle—the French loss being about equal. This drawn battle (the Archduke having, as Savary says, 'in reality no reason for retiring') had all the moral effects of a victory for the French; and was followed on July 11 by the armistice of Znaim, which resulted in the fourth treaty of Vienna.

WAGTAIL (*Motacilla*), a genus of birds of the family *Motacillidae*, which is now very generally regarded as a sub-family (*Motacillinae*) of *Sylviidae*, distinguished by a lengthened and slender bill, long and pointed wings, rather long and slightly curved claws, and a long narrow tail, which the bird incessantly wags up and down, with a jerking motion. The genus *Motacilla* of Linnæus included many of the *Sylviidae* not belonging to this group, as the Red-breast, Nightingale, Black-cap, and Blue-bird. The genus *Motacilla*, as now restricted, has a slender awl-shaped, straight bill; the nostrils oval, on the sides of the bill near the base, partly covered by a naked membrane; the wings of moderate size, the first quill-feather the longest, the second and third nearly as long as the first, the tertials very long; the tarsus much longer than the middle toe; the tail of twelve feathers, long, and nearly equal at the end.—The wagtails run with great celerity, and seek their food on the ground. Their food consists chiefly of insects and small seeds. They frequent the margins of rivers and lakes, inundated fields, and other moist grounds. 'While the cows are feeding, in moist low pastures,' says White (*Nat. Hist. of Selborne*), 'broods of wagtails, white and gray, run round them, close up to their noses, and under their very bellies, availing themselves of the flies that settle on their legs, and probably finding worms and larvae that are roused by the trampling of their feet.' Wagtails make their nests on the ground, among moist herbage, or in stony places. Their flight is rapid and undulatory. They are natives of the temperate regions of the Old World. No species is found in America.—

A common British species is the PIED W. (*M. Yarellii*), which is from seven to eight inches in length, the long tail included, and has prettily varied white and black plumage. It is abundant over the whole south of Europe, and is found there at all seasons of the year, which is the case also in the south of England; but in more northern regions it is only a summer visitant, as in the Orkney Islands, where it is the first of the migratory birds to depart southward, the migration taking place almost as soon as the young are able for flight. The Pied W. is incessantly in motion, jerking its tail, running

1, Yellow Wagtail (*Motacilla flava*); 2, Pied Wagtail (*M. Yarellii*).

quickly along the ground in quest of insects, and making short flights from place to place, chirping as it flies. It is often to be seen wading in shallow water, in pursuit of aquatic insects, and catching also small minnows when they approach the surface of the water. This species was long confounded with the WHITE W. (*M. alba*), of the continent of Europe, common from Sweden to the Mediterranean, as also in many parts of Asia, and in elevated situations in India and the north of Africa, but not a native of Britain. The two species are, however, very similar.—The GRAY W. (*M. boarula*) is bluish gray above, with the rump and lower parts yellow; a black patch on the throat in summer. It is abundant on the continent of Europe, as well as in Britain, and is commonly seen on pastures, often in close attendance on cattle or sheep, whence the French name, *bergeronette*, given to this and other species of W. of similar habits.—The YELLOW W. (*M. flava*) and the GREEN-HEADED W. (*M. Rayi*), also British species, of which the latter is the more common, belong to a sub-genus, by some regarded as a distinct genus, *Budytes*, having the hind-claw very long and sharp, and thus approaching in character to the Pipits (q. v.) or Titlarks.

WAHA'BIS, or WAHA'BITES, a recent Mohammedan sect, now dominant throughout the greater part of Arabia. The movement may be considered a puritanic reform, which seeks to purge away the innovations and corruptions introduced in the course of ages, and to bring back the doctrines and observances of Islam to the literal precepts of the Koran and of the Sunna (q. v.), or oral instructions of Mohammed himself. This purified faith the W. consider it their duty to impose at the point of the sword—in this, too, following strictly the precepts and practice of Mohammed and the first califa.

The founder of the sect, Ibn-abd-ul-Wahab, was the son of an Arab sheik, or chief, and was born in Nejed or Nejd (the Central Highlands of Arabia), about the end of the 17th century. He is said to have visited various schools in the principal cities of the East, and to have lived some years in Damascus; and here he is represented as forming the resolution to restore in its primitive shape the ruined structure of Islam. Nor was the task an easy one. Throughout the Mohammedan world, the precepts of the Koran had fallen into abeyance, more especially among the Turks; and religion was little else than a round of external ceremonies—prayers, ablutions, fastings, the worshipping of the holy sheiks or saints at their tombs, and other superstitious innovations. In Central and Eastern Arabia, where the faith of Mohammed had never taken deep root, matters were even worse. According to Palgrave, 'almost every trace of Islam had long since vanished from Nejed, where the worship of the Djann (genii), under the spreading foliage of large trees, or in the cavernous recesses of Djebel Toweyk, along with the invocation of the dead and sacrifices at their tombs, was blended with remnants of old Sabæan superstition, not without positive traces of the doctrines of Moseylemah and Kermut. The Koran was unread, the five daily prayers forgotten, and no one cared where Mecca lay, east or west, north or south; tithes, ablutions, and pilgrimages were things unheard of.' Central Arabia was at that time divided among a multitude of virtually independent chiefs. One of these chiefs, named Sa'u'd (or Saoo'd), a young man of ardent and capacious mind, who ruled over the small territory around the stronghold of Deraijeh, or Dureeyeh* (in Nejed), was the first important convert made by Ibn-abd-ul-Wahab after his return home; and the example of the prince was followed by his kindred and retainers. The Wahabi is said to have promised Sa'u'd that if he would draw the sword in the cause of pure Islam, he would make him sole ruler of Nejed, and the first potentate in Arabia. The prophecy was fulfilled, partly in Sa'u'd's reign, and fully in that of his son; and the Sa'u'd dynasty is at this day the chief power in the peninsula; while the descendants of Ibn-abd-ul-Wahab (who lived till 1787) continue to act as spiritual directors, though without any acknowledged authority. It was about 1746 that Sa'u'd began to act as apostle militant of the new, or rather revived Islam. One after another, he subdued his heretical neighbours, offering them the alternative of conversion or extermination. Dying in 1765, he was succeeded by his son, Abd-ul-Aziz, who carried on the same policy with vigour and success. Extending his sway to Hassa (Al-Ahssa, as Colonel Pelly spells it, and anciently Hajr), and other places on the Persian Gulf, he was brought in hostile contact with the Turkish authorities of Bagdad, and from that place an expedition was sent in 1797 against the W. by way of Hassa; but it failed to penetrate into Nejed, and proved fruitless. The W. now grew bolder in their plundering excursions towards the Euphrates, and in 1801, Sa'u'd, the son of Abd-ul-Aziz, led an army against the holy city of Meshed Hussein, or Kerbela, took it, massacred the greater part of the inhabitants, destroyed the tomb of Hussein, the grandson of Mohammed, and carried off the treasures. On this, a second Turkish army was sent from Bagdad against Nejed, but was routed, and the greater part slain. The conquest of Hejaz was next undertaken by the Wahabis. For two or three

* Nothing is more perplexing than the orthography of Arabic proper names; every traveller spells them in a way of his own. In comparing Burckhardt, Palgrave, and Colonel Pelly, it is often difficult to identify the places and persons spoken about.

years, Ghaleb, the ruler of Mecca, had been more and more hemmed in by neighbouring chiefs who had joined the W., and now, in 1803, Sa'ud collected a large army, and defeating Ghaleb in several battles, laid siege to Mecca, which, after a resistance of two or three months, surrendered at discretion. Not the slightest excess was committed, but the people had to become W.—that is, they were obliged to pray more punctually than usual, to lay aside and conceal their fine silk dresses, and to desist from smoking in public. Heaps of Persian pipes, collected from all the houses, were burned before Sa'ud's head-quarters, and the sale of tobacco forbidden.—Burckhardt.

Failing to take Jiddah, into which Ghaleb had thrown himself, the Wahabi forces went northwards, and, in 1804, took Medina, where they stripped the tomb of Mohammed of its accumulated treasures, and prohibited the approach to it of all but W., as they considered the reverence paid to it by the Turks and others as idolatrous. At Medina, the Wahabis enforced with great strictness the regular observance of prayers. The names of all the adult male inhabitants were called over in the mosque after morning, mid-day, and evening prayers, and those who did not obey the call were punished. A respectable woman, accused of having smoked the Persian pipe, was placed upon a jackass, with the pipe suspended from her neck, round which was twisted the long flexible tube or snake: in this state she was paraded through the town.—Burckhardt.

During these events, Abd-ul-Aziz had been assassinated, in the end of 1803, by a fanatical Persian, whose family had been murdered by the W. at Meshed Hussein. He was succeeded by his son, Sa'ud II., who had for some time conducted the wars, and was perhaps the ablest ruler and warrior of the dynasty. For several years after the conquest of Hejaz, he continued to extend and consolidate his power. Plundering incursions were made to the very vicinity of Bagdad, Aleppo, and Damascus; while the Wahabi sheik of Asir (lying south of Hejaz) imposed the new faith on a great part of Yemen. On the east, Sa'ud took the islands of Bahrein, annexed a part of the Persian coast on the east side of the Gulf, and exacted tribute from the sultan of Oman. This brought him into conflict with Great Britain, which sent (1808) a force, and severely chastised the Wahabi pirates that infested the commerce of the Persian Gulf.

While these external struggles were going on, several of the southern provinces of Nejed broke out in revolt, instigated mainly, perhaps, by the local chiefs, whose power, formerly independent, was now circumscribed, or altogether taken away by the central government; but the rising was speedily suppressed, and a terrible example was made of the province of Harik and the town of Hutah, which last was completely demolished, and its inhabitants (the male inhabitants were reckoned at 10,000) butchered almost to a man.

From 1802, the W. had prevented the great pilgrim caravans from reaching Mecca, both because they held the observances of the Turk and Persian hajjis to be idolatrous, and also because they were scandalised at the gross immorality and indecency which were openly practised by these pilgrims. It may easily be conceived what horror spread through the Mohammedan world when it was told that the tomb of the Prophet had been despoiled by heretics, who prevented the faithful from performing the most sacred duty of their religion. Accordingly, the sultan of Constantinople, the acknowledged protector of Mohammedanism, as early as 1804, imposed on Mehemet Ali, the newly appointed pasha of Egypt, the task of recovering the holy

cities. With the dilatoriness, however, characteristic of the East, nothing was done till 1811, when an expedition was sent against them, under the command of the pasha's son, Tûstûn-Bey. Medina was taken by the Egyptian forces in 1812, and Mecca in the following year; and a protracted and desultory warfare, with varying success, was kept up with the W. in Hejaz and around its confines. At last, in 1815, Ibrahim Pasha (q. v.) undertook to penetrate into Central Arabia, and crush the hornets in their nest. The enterprise was facilitated by the death of Sa'ud in 1814. He was succeeded by his son Abdallah, who, though an able warrior, was less adroit in securing unity of action among the numerous tribes under his sway. It was not, however, till 1818, and after repeated conflicts, that Ibrahim succeeded in decisively breaking the Wahabi force, and capturing their capital, Derajeh, which was laid in ruins. Abdallah-ibn-Sa'ud was sent to Constantinople, where he and some of his ministers were beheaded (1818). Ibrahim continued some months in Arabia, consolidating his conquests throughout Nejed and the adjoining provinces. His policy was one of gentleness and conciliation towards the chiefs and common people, and of stern repression towards the fanatical religious teachers; and except among these, his name is said to be yet popular throughout Central Arabia. But the folly and tyranny of the vice-governors whom he left soon caused a general insurrection; the Egyptians had to retire to Kasim; and Turki, a son of Abdallah, was proclaimed sultan of Nejed, Riad being now chosen as the capital. Renewed expeditions were undertaken by the Egyptian commanders, driving, first, Turki from his capital for a time, and then his son and successor, Feysul; instead of whom, a chieftain favourable to Egyptian rule was appointed. But soon after the death of Mehemet Ali (1849), the Egyptians gave up the struggle; Feysul was recalled from exile; and under him and his son and vicegerent, Abdallah II., who unites in a high degree the fanaticism and ferocity of the W. with great skill in military tactics, the Wahabi sway, according to the accounts of Palgrave in 1863, and of Colonel Pelly in 1865, had become more powerful and extensive than ever, and threatens to swallow up the entire peninsula. Feysul is sometimes styled Emir (ruler), and sometimes Imaum (spiritual chief).

According to Burckhardt, there is not a single new precept in the Wahabi code. The only difference between the sect and the orthodox Turks (improperly so termed) is, 'that the Wahabis rigidly follow the same laws which the others neglect, or have ceased altogether to observe. To describe, therefore, the Wahabi religion, would be to recapitulate the Mussulman faith; and to shew in what points their sect differs from the Turks, would be to give a list of all the abuses of which the latter are guilty.' One peculiarity of the W. is their zeal against gaudy dress—silk and gold ornaments—and tobacco. In their wars of conversion, 'No Smoking' has been a kind of battle-cry. The recent traveller, Palgrave, who came into more intimate contact with the W. than Burckhardt, has a much less favourable opinion both of their doctrines and their practice. He describes their empire as 'a compact and well-organised government, where centralisation is fully understood, and effectually carried out, and whose mainsprings and connecting links are force and fanaticism. Its atmosphere, to speak metaphorically, is sheer despotism—moral, intellectual, religious, and physical. This empire is capable of frontier extension, and hence is dangerous to its neighbours, some of whom it is even now swallowing up, and will certainly swallow more if not otherwise prevented. Incapable of true internal progress,

WAHABIS.

hostile to commerce, unfavourable to arts, and even to agriculture, and in the highest degree intolerant and aggressive, it can neither better itself nor benefit others; while the order and calm which it sometimes spreads over the lands of its conquest are described in the oft-cited *Ubi solitudinem faciunt pacem appellant* of the Roman annalist. We may add, that its weakest point lies in family rivalries and feuds of succession, which, joined to the anti-Wahabian reaction existing far and wide throughout Arabia, may one day disintegrate and shatter the Nejdean Empire, yet not destroy it altogether. But so long as Wahabism shall prevail in the centre and uplands of Arabia, small, indeed, are the hopes of civilisation, advancement, and national prosperity for the Arab race.' Colonel Pelly characterises the W. as 'warlike Mohammedan Quakers.'

The following statistical table of the W. Empire

was drawn up by Palgrave, mostly from the official registers at Riad:

| Provinces. | Towns or Villages. | Population. | Military Muster. |
|----------------------------|--------------------|-------------|------------------|
| 1. Aered, | 15 | 110,000 | 6,000 |
| 2. Yemamah, | 32 | 140,000 | 4,500 |
| 3. Harik, | 16 | 45,000 | 2,000 |
| 4. Añaj, | 12 | 14,000 | 1,200 |
| 5. Wadi Dowasir, | 50 | 100,000 | 4,000 |
| 6. Seley'el, | 14 | 20,000 | 1,400 |
| 7. Woshem, | 20 | 80,000 | 4,000 |
| 8. Sedyr, | 25 | 14,000 | 5,200 |
| 9. Kasim, | 60 | 300,000 | 11,000 |
| 10. Haxa, | 50 | 160,000 | 7,000 |
| 11. Katif, | 22 | 100,000 | |
| | 316 | 1,219,000 | 47,300 |

The Bedouin populations within the territories number upwards of 70,000. A good many of the

Arabia, shewing the Territory of the Wahabis.

(From the map in Palgrave's work on Arabia; by permission of the publishers, Messrs Macmillan.)

towns are large, and populous to a degree that the current notions of Central Arabia would hardly lead us to look for. The following are among those of which Palgrave estimates the population: Eyun,

10,000; Bereyadah, 25,000; Oneyzah, 30,000; Toweym, 12,000—15,000; Horeymelah, 10,000; Mejmañ, 10,000—12,000; Riad, the capital (which Colonel Pelly has ascertained to be in lat. 24° 38' 34", long.

46° 41' 48"), has probably about 40,000; Kharfah, 8000; Hofhuf (Al-Hufhuf), 24,000. Katif (Khutif) is the most direct port of the W. dominions; and the province of Hassa in which it is situated is the richest.

To the north of Nejed and its dependencies, lies a kingdom ruled over by a half-hearted ally of Feysul's, Telal, the chief of Djebel Shomer, and consisting of five provinces—Djebel Shomer, Djowf, Kheybar, Upper Kasim, Teymar—with a settled pop. of 274,000, and 166,000 Bedouins. Hayel, the capital, has a pop. of 22,000. This part of Arabia was overrun and converted during the first outbreak of Wahabi propagandism; but the conversion was only seeming, and during the interference of Egypt in Arabian matters, the country regained a kind of independency. The great majority of the people are averse to Wahabism, and, indeed, care little for Islam in any form. Still, the W. have numerous partisans and missionaries and spies in all the towns, and their influence is hated and feared by prince and people. Even Oman, where the new Islam is said to be still more distasteful, has been brought in some degree under the political sway of the Wahabis, and pays a small yearly tribute.

Karsten Niebuhr (q. v.) is the first European writer who mentions the W.; Burckhardt, *Notes on the Bedouins and Wahabis* (1830), gives a sketch of the Wahabi doctrines and of their history down to 1815; Sir Harford Jones Brydges, for many years resident at Bagdad, to his *Account of the Transactions of His Majesty's Mission to the Court of Persia*, appends a 'Brief History of the Wahaby'; Mengin, *Histoire de l'Egypte sous le Gouvernement de Mohammed Ali*; Corancez, *Histoire des Wahabis*, with Maps. The most recent authorities on the subject are W. G. Palgrave's *Narrative of a Year's Journey through Central and Eastern Arabia*, 1862—1863 (Macmillan & Co., 1865); and 'A Visit to the Wahabee Capital,' by Lieut.-Col. L. Pelly, H.M. Political Resident, Persian Gulf, in *Geog. Soc. Journal*, 1865.

WAHOO. See ELM.

WAI'BLINGEN, a town of Würtemberg, on the Rems, in the circle of the Neckar, with a pop. of 3260. It usually gets the credit of having given to the family of the Hohenstaufen the title which became Italianised into Ghibellines (see GUELPHS AND GIBELLINES); but Raumer (q. v.), the historian of the Hohenstaufen dynasty, upholds the claim of another Waiblingen in Würtemberg, on the Kocher, in the circle of Jaxt.

WAIFS, in English Law, are goods stolen, and waived or abandoned by the felon on being pursued. The goods belong to the crown, but the owner, on doing diligence to prosecute and convict the thief, can have them again.

WAINSCOT (Sax. *wag*, a wall, and *scot* or *schot*, corresponding to Ger. *Scheit*, a split or cut piece of timber—from *scheiden*, to divide; the word would thus mean wall-timber or boards), the name given to boards lining the interior walls of apartments. Such lining, usually in panels, is very common in Elizabethan architecture. The name is frequently applied to the best kinds of oak-boards, from oak having been so much used for panelling.

WAIST, in a Ship, is that portion of the upper deck lying between the fore and main masts. In it the larger boats are stowed, and along its gunwale the crew pile their hammocks during the day. In a steamer, the waist is much broken into by the engine-room.

WAITS (anciently spelled *Waights*) is a name which has at successive periods of our history been given to different classes of musical watchmen. The word is one, in slightly varied forms, common in the sense of guard or watchman to all the Germanic languages. It is the German *Wacht* or *Wache*, Dutch *wagt*, Danish *vagt*, Swedish *wagt*, Scotch *waite*, and the English *watch*. How the word in the form of waits came to be exclusively applied to musical watchmen in England and Scotland, it is impossible to say. In the time of Edward IV. the waits appear to have formed a distinct class from both the watch and the minstrels. It was their duty, we learn from Rymer's *Foedera*, to pipe the watch nightly in the king's court from Michaelmas to Shrove-Thurs-day four times, in the summer nights three times, and to make 'the bon gayte' at every chamber-door and office, for fear of pykeres and pillers. The waits were not confined to the court; there were musical watchmen at an early period in many provincial towns. In Exeter, a regular company existed in 1400. Beaumont and Fletcher (*Knight of the Burning Pestle*) speak of the 'waits of Southwark as rare fellows as any in England.' The word in the provinces was afterwards sometimes applied to the town musicians, who may have represented the old waits, but who had no duties to perform as watchmen. The name was also given to the town-band or to private musicians when employed as serenaders. In this sense it is used in the *Tattler* (No. 222). The writer says that it had become so much the custom for lovers to employ the waits to help them through their courtship in Nottingham, that the ladies of that place could get no sleep, by reason of riotous lovers who infested the streets with violins and bass-voils between 12 o'clock and 4 in the morning. Till recently, the waits were officially recognised in London and Westminster. In London, the post of leader of the waits was purchased; in Westminster, the appointment was in the gift of the High Constable and Court of Burgesses. In 1820, a Mr Munro obtained the post of official leader of the waits for Westminster, with the exclusive right to serenade the inhabitants, and make application for Christmas-boxes. His prerogatives were invaded by other musicians, and he prosecuted several persons before the police courts. At present, in the metropolis, the waits are musicians who play during the night or early in the morning for two or three weeks before Christmas. They call afterwards at the houses of the inhabitants to ask for a Christmas-box. In Glasgow, there were waits at an early period. The magistrates still grant a certificate to a few musicians, generally blind men, who play in the streets during the night and morning for about three weeks previous to New-Year's Day. Like the London waits, they call at the houses of the inhabitants, shew their credentials, and ask a small subscription.—See Chambers's *Book of Days*, vol. ii. p. 742.

WAITZEN, a town of Hungary, charmingly situated among vineyards, on the left bank of the Danube, 21 miles north of Pesth, on the Vienna and Pesth Railway. It is a bishop's see, contains a noble cathedral with conspicuous dome, built in 1777, and a handsome episcopal palace. Considerable wine-culture is carried on, and there are important cattle-markets. Pop. 12,000.

WAKE (from the Anglo-Saxon *wacian*, to watch) is the English equivalent of the ecclesiastical Vigil (q. v.). In early times, the day was considered as beginning and ending at sunset; Sundays and holidays, in consequence, began not on the morning, but on the previous evening (the eve of the

holiday), and worshippers then repaired to the churches for worship. The following day was spent in amusement. Each church when consecrated was dedicated to a saint, and on the anniversary of that day was kept the parish wake. In many places, there was a second wake on the birthday of the saint. On these occasions, the floor of the church was strewed with rushes and flowers, and the altar and pulpit were decked with boughs and leaves. In the churchyard, tents were erected to supply cakes and ale for the use of the crowd on the morrow, which was kept as a holiday. The second part of the festival seems to have made most impression on the popular mind, and the word wake came to be applied to it. Crowds resorted to the wakes from neighbouring parishes, hawkers or merchants were attracted by the crowds, and ultimately they became mere fairs or markets, little under the influence of the church, and disgraced by scenes of indulgence and riot. In 1285, Edward I. passed a statute which forbade fairs and markets to be held in country churchyards; but it does not appear to have put an end to the evil. In 1448, Henry VI. ordained that all showing of goods and merchandise, except necessary victuals, should be discontinued on the great festivals of the church. These regulations do not seem to have been strictly enforced. An act of convocation passed in 1536, during the reign of Henry VIII., seems to have effected a more important change. It ordered the day of the dedication of the church to be kept in all parishes on the first Sunday in October, and gradually that festival ceased to be observed. The saint's-day festivals were not, however, affected, and they are still kept in many English parishes under the name of 'country wakes'. A *lyte-wake* or *liche-wake* is a watching of a dead body (*A. S. lic*) all night by the friends and neighbours of the deceased. The custom no doubt originated in superstitious fear either of passing the night alone with a dead body, or of its being interfered with by evil spirits. It must at all times have led to scenes ill suited to the occasion, and it now survives only among the lower classes in Ireland.—See Brand's *Popular Antiquities*, by Ellis.

WAKEFIELD, an important and handsome town in the West Riding of Yorkshire, overlooking the Calder, 9 miles south of Leeds, on the Lancashire and Yorkshire Railway. The town consists of three principal and many minor streets, and among the chief buildings are the parish church, conspicuous from its lofty and elegant spire; the grammar-school, a wealthy institution, attached to which there are six exhibitions to the universities; the library and news-rooms, corn exchange, &c. Its benevolent and scientific institutions are numerous and important. The town has long been famous for its manufactures of woollen yarn and cloths. The district around W. is agricultural, and the town is noted for its corn and cattle markets. Coal-mines are worked in the vicinity. W. returns one member to the House of Commons. Pop. (1861) 35,739.

WALACHIA. See MOLDAVIA.

WALCHEREN, an island in the Netherlands province of Zealand, at the mouth of the Scheldt, contains 55,000 acres, and has a pop. of 45,000. The chief places are Middelburg, Flushing, and Vere or Campvere (q. v.). One half is meadow, the other rich arable land, well wooded to the north. Where it is not protected by natural downs, strong dykes have been formed, that at West Kappelle being a magnificent work. The drainage-water is carried off by large sea-slucices at Middelburg and Vere. Agriculture

is the principal employment. Ship-building, beer-brewing, rope-spinning, weaving, sawing wood, grinding corn, tanning leather, &c. are carried on, especially at Middelburg and Flushing. From the latter town, a railway is being constructed (1866) through West and South Beveland to Bergen-op-Zoom, joining the other continental lines. The people are chiefly Protestants. In many parts are large artificial mounds, supposed to have been erected by the early inhabitants as places of refuge from high tides.

WALCHEREN EXPEDITION, one of the most disastrous military failures in the history of modern warfare, was undertaken, like that of Sir John Moore to Spain, with the view of helping the continental allies of Britain, by creating such a diversion as would prevent the concentration of Napoleon's strength, in overwhelming amount, against any one of his opponents. The expedition was planned in 1807, when Prussia, Russia, and Austria were all in arms against France; but it was not till early in the summer of 1809 (when Napoleon, who had meantime overwhelmed Prussia, and reduced Russia to neutrality, was gradually forcing Austria to succumb) that the British ministry resolved to carry it out. The plan was to send a fleet and army up the Scheldt, and attack Antwerp (the principal naval station and arsenal in the north of France), whose fortifications, though formidable, were much in need of repair, and whose garrison at the time only numbered about 2000 invalids and coast-guards; while there were not more than 10,000 French soldiers in Holland. The expedition, after numberless needless delays, at last sailed on July 28; and, to the number of 37 men-of-war, 23 frigates, 115 sloops and gunboats, accompanied by transports, carrying about 41,000 soldiers, reached the Dutch coast on the following day. But, instead of obeying the orders of the minister of war, Lord Castlereagh, to *advance at once in force against Antwerp*, the commander-in-chief, Lord Chatham (the elder brother of Pitt), frittered away his time in the reduction of Vlissingen (Flushing), which was not effected till August 16, by which time the garrison of Antwerp had been reinforced by King Louis Bonaparte with the troops at his command (about 6000), and by detachments sent from France, which swelled the garrison, by August 20, to 15,000 men. About the end of August, Chatham, who, as a general, was a methodical incapable, 'found himself prepared' to march upon Antwerp, but by this time 30,000 men, under Bernadotte, were gathered to its defence, and the English army was decimated by malarial-fever, so that success was not to be hoped for. However, it was judged right to hold possession of Walcheren, in order to compel the French to keep a strong force on the watch in Belgium, and, accordingly, 15,000 men remained to garrison the island, the rest returning to England; but the malaria proved too fatal in its ravages, and as peace had been concluded between Austria and France, this force was also recalled. Thus an excellently devised scheme, through the utter stupidity of the agent chosen by royalty to carry it out, failed in every point of consequence, and ended in a loss of 7000 men dead, and the permanent disablement of half the remainder. The failure of the Walcheren Expedition was made the occasion of furious onslaughts on the ministry in the House of Commons and in the public journals.

WALDECK-PYRMONT, a sovereign principality in the north-west of Germany, consists of the old county of Waldeck, enclosed between Westphalia, Hesse-Cassel, and Prussia, and the small

county of Pyrmont, about 30 miles north of Waldeck. Area of Waldeck, 407 sq. m.; of Pyrmont, 25 sq. m.: entire area, 432 sq. miles. Pop. of Waldeck (1864), 51,824; of Pyrmont, 7319: entire pop. (December 1864) 59,143. The elevation of the country is greater than that of most districts of Northern Germany; and the scenery, continually alternating between mountain and valley, forest and plain, comprises scenes of much natural beauty. The two largest rivers are the Eder and Diemel, affluents of the Weser. Among the minerals found are gold, copper, iron, and lead; and mineral springs occur. Agriculture and cattle-breeding are by far the most common pursuits of the people, and with the exception of leather, no articles are manufactured to any extent. An important article of export, and one from which the prince derives a considerable portion of his revenue, is the mineral water of the Pyrmont spa.

The noble House of W., one of the oldest in Germany, formerly owned, besides their present possessions, the counties of Swalenburg and Sternberg, but lost the former in 1356, and the latter in 1399. W.-P. is now (1867) a member of the North German Confederation. The chief town is Arolsen, with 2500 inhabitants.

WALDENSES (VALDENSES, VALDESI, VALESII, VAUDOIS) are a Christian community who inhabit a mountain tract on the Italian side of the Cottian Alps, south-west from Turin. The district is bounded on the N. by the Dora Ripaira, on the S. by the Po. It is enclosed on all sides by spurs of the Alps, which divide it into three valleys—that of Perosa, drained by the Clusone; that of San Martino, drained by the Germanasca; and that of Lucerna, drained by the Pelice, all tributaries of the Po. These valleys lie between France and Italy, and immediately south of the great western route into Italy by the passes of Mont Cenis and Genevre. The inhabitants are thus brought into communication with both countries; indeed, they speak a dialect more closely allied to those of Dauphiné than to those of Piedmont; and they have used French as well as Italian as the language of their liturgy. The religious doctrines of the W. are now similar to those of the Reformed churches. There is a minister in each parish, called a *barbe*, and the synod is presided over by an elected *moderator*. The W. had at one time bishops, but that was when the sect was more widely spread than it now is. Much has been said of the origin of the Waldenses. Their own historians assert that the community has remained from apostolic times independent of the church of Rome, and boast that they can shew a regular apostolic succession of bishops from the earliest period of Christianity till that of the Reformation. This statement has been very generally admitted by uncritical writers, but in the light of recent investigations, would seem to be no longer tenable. Dieckhoff (*Die Waldenser im Mittelalter*, Gött. 1851) and Herzog (*Die romanischen Waldenser*, Halle, 1853) have submitted the early history of the W. to a critical examination; and the result to which they have come, after an examination of the manuscript records, is, that the W. had not the early origin claimed for them, and were not Protestant before the Reformation, although they entertained some opinions which, so far, were in anticipation of those held by the Reformers. They are also of the opinion that the W. do not take their name from *val*, *vallis*, a valley, as has been assumed, but from Peter Waldo of Lyon, a merchant of the 12th c., who was less the founder of a sect than the representative and leader of a wide-spread struggle against the corruptions of the clergy. The church would have

tolerated Peter Waldo, as it had tolerated St Francis of Assisi, the founder of the Franciscans, and perhaps have allowed him to form a new order, had he not trenched upon ground dangerous to the hierarchy. But he had the four gospels translated, and maintained that laymen had a right to read them to the people. He exposed in this way the prevalent ignorance and immorality of the clergy, and brought down their wrath upon himself. His opinions were condemned by a general council in 1179, and he retired to the valleys of the Cottian Alps. A long series of persecutions followed, but Waldo's followers could not be forced to abandon their opinions. They continued to be known as the *Leonisti*, from the place of their origin—the Poor People of Lyon, from their voluntary penury—*Sabotati*, from the wooden shoes they wore—and *Humilitati*, on account of their humility. It was natural that a body cruelly persecuted should stand aloof from the church, and even offer armed resistance; yet we have no evidence of the manner in which the W. first became a separate community. They are now shewn to have been identical with the followers of Waldo, but they must not be confounded with the Albigenses, who were persecuted at the same period. The protest of the W. against the church of Rome only related to practical questions, that of the Albigenses related to matters of doctrine.

The W. at first seem to have spread in the upper valleys of Dauphiné and Piedmont, to which Waldo retired. They were subjected to persecutions in 1332, 1400, and 1478, and driven into many parts of Europe, where their industry and integrity were universally remarked. So widely had the sect been scattered, that it was said a traveller from Antwerp to Rome could sleep every night at the house of one of the brethren. In Bohemia, many of them had settled, and they, without forsaking their own community, joined the Hussites, Taborites, and Bohemian Brethren—a connection which led to a change in the principles of the Waldenses. They adopted the doctrines of the Reformers, and this led to more serious persecutions than any they had previously undergone. Francis I. of France, in possession of Piedmont in 1541, ordered them to be extirpated. They were massacred at various places in Dauphiné and in the valleys they still occupy, more especially at Merindol and Cabrière. Several persons who refused to abandon their faith, were burned alive, yet the sect continued to exist. In 1560, the Duke of Savoy, who had recovered possession of Piedmont, urged by Pope Paul IV., forbade the W. to exercise their faith, under the penalty of being sent to the galleys for life. The W. sent him a petition and apology for their creed, which appeared to him so plausible, that he suggested that a conference should take place between the Waldensian and Romanist divines. He was, of course, told that the proposition was monstrous, and bullied by the pope and the courts of Spain and France so effectually, that he despatched 7000 men into the valleys, who were joined by two French regiments. The W. offered a gallant resistance, but were overwhelmed by superior force. Many prisoners were burned alive, and women and children were ruthlessly slaughtered. The duke was disgusted with these atrocities, and although denounced as no better than a heretic at Rome, granted the W. an amnesty on condition that their service should only be performed at certain places in the valleys of Lucerna and San Martino. The W. in the other districts, and especially the Marquisate of Saluzzo, were then persecuted by the Jesuits. Charles I. of England sent two embassies to the Duke of Savoy to intercede in their behalf, but without avail.

Victor Amadeus I., not long after, ordered the W. of Saluzzo, under penalty of confiscation of property and death, to become Catholics; and the edict was so rigorously carried out that, in a few years, none of the sect remained in the district. Charles Emmanuel II., in 1655, directed a fresh persecution against the Waldenses. Some time before, the people of Lucerna, inflamed it is said by the discourses of Jean Leger, a popular preacher, set fire to a convent of Capuchins, and committed other excesses. An inquiry was made, and it was found that the W. had purchased property and built churches and schools in districts where no concessions had been granted them. They were ordered within 20 days to sell their property, or profess Catholicism. They resisted, under leaders named Jayer and Janavel, but they could not oppose the forces sent against them. No quarter was shewn to women and children, and atrocities were committed—more especially by the French and Irish mercenaries in the service of the duke—which, recorded by Jean Leger, were heard of with indignation in all Protestant countries. Subscriptions were made in England for those who had survived the massacre. The Swiss cantons, and the states of Holland, sent envoys to the duke. Cromwell addressed Latin letters to him, written by Milton, and also sent Sir Samuel Morland, who collected numerous manuscripts connected with the history of the W., and brought them to England with him. A convention was concluded, by which the W. were allowed again to exercise their worship. In 1685, Louis XIV. revoked the Edict of Nantes, and ordered the Duke of Savoy to compel the W. to adopt Catholicism. They were accordingly commanded to emigrate or abjure their tenets within 15 days. They resisted, and were attacked by the troops of the duke on one side, and those of Louis XIV. on the other. They were overpowered, and the survivors could make no conditions. A large number were imprisoned at Turin, where many died; others were allowed to emigrate. Their whole property was confiscated, and handed over to Roman Catholic colonists. When the Prince of Orange became king of England, the W. who had settled in Switzerland resolved to return to their valleys under the guidance of Henry Arnaud, one of their pastors. In 1689, they gathered from all quarters to the rendezvous in the great forest of the Pays de Vaud. On the night of the 16th of August, they embarked on the Lake of Geneva, landed on the opposite shore, and after encountering the most determined opposition, reached the valley of San Martino, after a perilous march of thirty-one days. During the winter, a French army of 22,000 men entered their territories, and in the following summer attacked their fortifications, but were repulsed with great slaughter. Fortunately, the French and Piedmontese at this juncture quarrelled, and the latter, to secure the services of the mountaineers, granted them an amnesty. They are said to have fought not less than eighteen battles against the French, and to have lost only thirty men. This was the last persecution against the Vandois; but it was not until the reign of the present king of Italy that they were admitted to the same privileges as Roman Catholics.—See Botta, *Storia d'Italia*; Bender, *Geschichte der Waldenser* (Ulm, 1850); Morland's *Churches of Piedmont*; Gelly's *Waldensian Researches*; Muston, *Israel of the Alps* (translated, Blackie, 1857).

WALES, NEW SOUTH. See NEW SOUTH WALES.

WALHA'LLA (the Hall of the Fallen, i. e., heroes. See WALKYRIES) is, in Northern Mythology, the name of the place of residence for the fallen in battle. This brilliant hall stood in Gladsheim (the house of joy); in front of it was the beautiful grove Glasur, the trees of which bore golden leaves. Before the hall, which was so high that its summit could scarcely be seen, a wolf was hung, as a symbol of war, over which sat an eagle; the saloon itself, ornamented with shields, and wainscoted with spears, had 540 doors, through each of which 800 of the inmates (Einherjer) could walk abreast. For these Einherjer (i. e., the brave), who came after death to Odin, was it destined. Renowned chiefs, especially if they had desolated many countries, and wielded the blood-dripping sword far and wide, were met and welcomed by Bragi and Hermode as messengers from Odin. The hall was decorated to honour them; all the divine heroes stood up at their reception; the Walkyries tasted wine for them, which otherwise only Odin drank. All kings came to Walhalla, even when they did not die on the battle-field; in general, these joys seem to have been prepared only for those of high rank and the rich. As it was honourable to come to Walhalla with a great retinue, and to possess many treasures, the comrades of a leader who had fallen in battle killed themselves of their own free will, and in his grave were laid along with his horse and arms the treasures won in fight. Every morning, the inmates marched out at the crowing of the cock, and fought furiously with one another; but at mid-day all wounds healed, and the heroes assembled to the feast under Odin's presidency. Odin himself partook of nothing but wine; he gave the edibles to the wolves Geri and Freki, who sat beside him. The guests ate of the bacon of the boar Sahrimmer, and refreshed themselves with beer and mead, which flowed in abundance from the udder of the goat Heidrun; the attendant Walkyries handed them the drinking-horns, under Freyja's direction. Occasionally, the hero rode by night to his grave, where the beloved Walkyrie received him; he reposed in her embrace till, night disappearing, he exclaimed: 'It is time to make the horse tread on the white stair of the sky; I must travel towards the west to the bridge of heaven before the cock awakes the warriors in Walhalla.' The half of the fallen belonged to Freyja. The boar Sahrimmer, of which the heroes ate, was prepared by the cook Andhrimmer in the kettle Eldhrimmer. *Sa* is explained as signifying water; *and*, breath or soul; *eld*, fire; *hrim*, i. e., frost, was the primitive matter of which the world was made; from the branches of the deer Eikthyrnir, standing over Walhalla, drops fell into the well Hvergelmer, from which all rivers flowed. According to this, the heroes appear to be conceived as stars or spirits of the constellations, which draw their nourishment from the elements; and Walhalla stands for heaven.

The name **WALHALLA** is also given to a magnificent structure erected by Ludwig I. of Bavaria (1830—1841) as a temple of fame for all Germany. He conceived the project in 1806, when the Fatherland was at its lowest point of degradation, and while he was yet crown-prince. The design of the building was by Klenze, and the chief sculptors of Germany have contributed to the execution of the plan. It stands on an eminence 250 feet above the Danube at Donaustauf, near Regensburg. The temple is of nearly the same dimensions and proportions as the Parthenon, and is built of marble. By means of statues, busts, reliefs, and tablets, the mythology and history of Germany are illustrated, and her greatest names commemorated. The undertaking is said to have cost 2,330,000

florins. The chief blemish in this splendid structure is, that a monument in honour of the German people, instead of being built in the old German style, has been made a copy of a Grecian temple.

WALKER, REV. GEORGE, an Irish clergyman, distinguished for the part he took in the heroic defence of Londonderry against the army of James II., was born in the county of Tyrone, of English parents, in the early part of the 17th century. He was educated at the university of Glasgow, and entering the church, became rector of Donoughmore. The early life of W. was not remarkable. When the Irish army of James II. entered Ulster, and took possession of Kilmore and Coleraine, W. sought refuge in Londonderry, the head-quarters of 'the Englishry' since the times of James I., when the confiscated lands of the county had been bestowed on the corporation of the city of London, and a Saxon colony, English and Scotch, had been planted there, who had converted a waste into the richest district of Ireland. The town was fortified sufficiently to protect it from the pike-armed Celtic peasantry, and it had resisted more than one attack. But it was not so defended as to oppose regular troops. Lundy, the governor, was in secret communication with the enemy, and prepared to hand over the town to them; but some of his own officers protested against this course, and the citizens, remarkable at the time for that high spirit which characterises a dominant race, and the possession of those qualities which made the soldiers of Cromwell famous, determined not to yield. The bishop, Ezekiel Hopkins, in vain inculcated the doctrine of passive obedience at a conference; he was interrupted by a lad, one of a daring band known as the 'thirteen Scotch apprentices,' who called out: 'A good sermon, my lord—a very good sermon; but we have no time to hear it now.' A Scotch fanatic named Hewson urged the Presbyterians not to ally themselves with the enemies of the Covenant; but he was laughed at by his countrymen. The thirteen apprentices closed the city-gates, and defied the enemy. It was then that W., described as an aged clergyman who had taken refuge in the city, encouraged the townspeople to fight to the last. W. saved Lundy from the rage of the populace, and enabled him to quit the city in safety. Major Baker, who soon after died, and W. became joint-governors, aided by Captain Adam Campbell. The siege is the most memorable in British history. It began in April, and lasted till the end of July 1689. The inhabitants were reduced to the greatest extremities by hunger, but they were sustained to the last by the rousing sermons preached to them by W. in the cathedral, and the example he and Captain Campbell set in heading rallying-parties. When the siege was raised by the English fleet entering the harbour, W. went to London. He was warmly received at court, thanked by the House of Commons, created D.D. by Oxford, and Bishop of Derry by the king. Portraits of him were in every house in England, and his triumph would have been complete had the Presbyterians not thought that their share in the defence of the city was overlooked, and provoked useless controversy. W. could not be induced to take quiet possession of his bishopric; he would head a troop at the battle of the Boyne, and he was there killed. A lofty pillar has been erected to his memory at Londonderry, and the Walker Club and the Campbell Club have kept alive to our times the recollection of the siege. W. published in 1689 *A True Account of the Siege of Londonderry*.

WALKING-LEAF. See **LEAF-INSECT**.

WALKING-STICK, the popular name of many insects of the family *Phasmida* (q. v.), destitute of wings, and having a long, slender, cylindrical body, like a small stick with the bark on, the delicate legs resembling little twigs. Their habits are very similar to those of the leaf-insects or walking-leaves,

Walking-stick (*Phasma gigas*).

and their peculiar appearance is, in like manner, their protection. Most of them are natives of warm climates, and they are widely distributed. Some of them attain a large size. *Phasma gigas*, an East Indian species, is seven or eight inches long. A species, between three and four inches long, *P. femoratum*, is found even in the northern and north-western parts of the United States.

WALKING-STICKS. The habit of using a stick, either for support or merely as a fashion, is of great antiquity; and in modern times, the supply of such articles constitutes a large branch of trade in European countries, especially in Britain, France, and Germany. The imports into London and other English ports of sticks in the raw state, to be afterwards dressed and mounted, is enormous, exceeding four and a half millions annually, and reaching a value of about £25,000. They chiefly consist of the small stems or canes of certain palms, as the Malacca cane; and others called Whangee and Penang Lawyers; the woody stems of some small species of bamboo are also used, besides straight shoots of orange, cinnamon, myrtle, and other shrubs. The preparation and sale of walking-sticks are extensively carried on in Hamburg, and the finer sorts are richly and tastefully mounted in Paris. London is, however, the greatest mart for all kinds of walking-sticks. Of British trees and shrubs, the oak, crab, hazel, and sloe are used to some extent for the manufacture of walking-sticks.

WALKY'RIES, beings of the Scandinavian Mythology (q. v.), the legend of whom is the most terribly beautiful in the whole system. The name is derived from the old Norse *val*, which signifies a heap of slaughtered men, and *kjora*, to choose. *Val* itself contains the notion of chosen, elect, being allied to Ger. *wahlen*, Scotch *wale*, to choose. The Walkyries, also called battle-maidens, shield-maidens, wish-maidens, are charming young women who, adorned with golden ornaments, ride through the

air in brilliant armour, order battles, and distribute the death-lots according to Odin's commands. Fertilising dew drops on the ground from the manes of their horses; light streams from the points of their lances, and a flickering brightness announces their arrival in the battle. With their charming glance, they rejoice the glazing eye of the hero, and lead him to Walhalla, where they act as his cup-bearers. Two Walkyries Hrist and Mist, are cup-bearers to Odin himself.

They differ in regard to their origin; some of them spring from Elves and other superhuman beings; some also are the daughters of princes, who in their lifetime are numbered among the Walkyries, shewing all their qualities, and when they die, their spirits become Walkyries. They ride generally in companies of three, or of three times three, or four times three, and have the gift of changing themselves into swans. They often choose noble heroes for lovers. Thus, Swawa was the beloved of Helgi, was twice, as Sigrum and Kara, re-born along with him, and accompanied him in his battles as a singing swan, flying over his head. Brynhild is also in the Norse heroic poem a Walkyrie. As a punishment for having distributed victory and death in battle contrary to Odin's will, he had taken the office of Walkyrie from her, and doomed her to marriage. Touched by Odin's magic rod, she lay in a trance till Sigurd, borne on his noble horse through the fire that flamed around her castle, undid her armour, and broke the spell. Whoever deprives a Walkyrie of her swan-robe, gets her into his power. Thus, three bold heroes took possession of the three princesses, Walkyries—Hladgudr Swanhwit, Herð Alvit, and Alrun—as they sat spinning fine flax by the seaside. They stayed seven years with them, and then went away to attend on battles again as Walkyries. Here they resemble the swan-maidens of the German Sagas. But amiable as they here appear, the song of the Walkyries in the Njals Saga sounds terrible, as sitting on a hill, they weave the battle-web during the battle of Sigtryg with the silken beard and King Brian of Ireland. The Walkyries were frequently confounded with the Norns or Destinies. They were also conceived under the figure of the clouds. Thus, Hrist signifies dark sky, and Mist signifies quaking. Most of the names of the Walkyries, however, relate to war and battle.

WALLABA TREE (*Eperva foliata*), a tree of the natural order *Leguminosæ*, sub-order *Cæsalpinææ*, a native of Guiana. The wood is deep red, often variegated with whitish streaks, hard, heavy, shining, resinous, and very durable. The leaves are pinnate, without a terminal leaflet; the flowers in panicles of numerous distinct racemes, on a long pendulous flower-stalk. The calyx consists of four sepals, connected into a tube at the base; the corolla of one roundish petal.

WALLACE, WILLIAM, the famous Scottish patriot, was the younger son of a knight of good family in the south-west of Scotland. Neither the date nor the place of his birth has been ascertained; but there is no doubt that the former may be assigned to the middle of the reign of Alexander III. Nothing certain is known of his education or his early years. His true history, even in the next generation, was so obscure, that it is now impossible to separate truth from falsehood or exaggeration. He first appears, in the light of authentic history, as the chief of a band of insurgents against Edward, king of England. Taking advantage of his superior power, of his influence over the barons of Norman race, who then were the foremost persons among the nobility of Scotland, and of the posi-

tion of umpire to which he had been chosen by the various claimants to the Scottish crown, Edward had established his supremacy over the northern kingdom, and afterwards deposed John Baliol, and attempted to govern in his own absolute right. See SCOTLAND, *History*. The injustice of the claim, and the cruelty with which it was enforced, roused the opposition of all classes in Scotland except the higher nobles. The gentry and the middle and lower classes of the Lowlands, had for many years identified themselves with the country in which they dwelt, rather than with the great English race from which most of them drew their descent; and what has been called the War of Independence began, which resulted in the deliverance of Scotland from foreign rule, at the cost of the comparative civilisation and tranquillity which the country had enjoyed under the descendants of Malcolm Canmore. In this struggle, W. was the most successful leader; and in the course of the year 1297, the insurrection became general. Edward himself was at that time in Flanders; but his general in Scotland, the Earl of Surrey, led his army to Stirling. On the 11th of September, they encountered the Scots under W., and were completely defeated. The whole kingdom submitted to W.; who, passing the Border, ravaged Cumberland and Northumberland without opposition. On his return from this expedition, he was elected by his countrymen Governor of Scotland, in name of King John, whose title was still recognised. In the following year, Edward in person entered Scotland at the head of a numerous army. He was met at Falkirk (q. v.) by W. on the 22d of July; but the Scots were defeated. It is generally assumed that the jealousy of some of the Scottish nobles, who envied the position of the governor, had aided in bringing about the disaster, and W., in consequence, resigned his high office. With this event, his brilliant public career may be said to have terminated; and the obscurity of the remaining period of his life is almost as great as that which covers its commencement. All that is certainly known is, that he continued to struggle for his country's independence, and never made his submission to Edward, or took those oaths of fealty to him which were so lightly made by the Scottish nobles, and as recklessly broken. The events of this period related by modern writers under the name of 'Lives of Wallace,' are either transactions in which there is no evidence that he took any part, or the doubtful legends which, as years went on, gathered round the name of the Scottish hero. Some documents of undoubted authenticity make it probable that he was for some time in France. The close of his life forms an exception to this obscurity. When Edward offered pardon to the other Scottish leaders on certain terms, W. was excepted by name. If he chose to surrender, he might do so, but it was to be without conditions, and his life was to be at the king's mercy. Efforts were also made to discover his retreat and secure his person, and these were finally successful. In the year 1306, he was seized by some of his own countrymen, and delivered to Edward. He was carried to London, and with a mockery of the forms of justice, tried for treason. He denied the charge, asserting, with truth, that he had never been the vassal or subject of Edward; but his plea was disregarded. He was condemned and executed on the 23d of August; and his death was accompanied by acts of barbarity uncommon even in that age, and marking the merciless character which distinguished the later years of the English king. Contradictory as are the accounts of the English and Scottish chroniclers, it is not difficult to discover

the true character of Wallace. He was the true leader of a national insurrection against a foreign yoke. He shared in the cruel and violent habits of his time, and in this was more excusable than the great king whose ambition and tyranny he opposed. The cruelties inflicted in his invasion of England are undeniable, but he did what he could to mitigate them; and he should not be severely blamed if, under far greater provocation, he tolerated what the good King David, in his War of the Standard, was unable to prevent. His memory lives, and will ever live in the hearts of his countrymen, who know that they owe to him and to those who followed in the same course, that their history has not been as unhappy as the history of Ireland. The chief authority for the Life of Wallace, as told by popular Scotch writers, is the poem of Henry the Minstrel. The fullest modern account is that given by Mr Tytler in the first volume of his *History of Scotland*, and in his Life of Wallace in the first volume of his *Scottish Worthies*. Reference may also be made to the second volume of Mr Burton's recently-published *History of Scotland*. It is satisfactory to know that the result of a careful examination of the latest and best sources by a writer so impartial, and so little apt to be carried away by enthusiasm of any kind, as Mr Burton, corroborates the most favourable estimate of W.'s character.

WALLACE, WILLIAM VINCENT, a British musician and composer of operas, was born at Waterford, of Scotch parents, June 1, 1814. He early attained proficiency as a performer on the pianoforte and violin—his performances on the latter instrument bringing him under the notice of Paganini. After being for some years leader of the orchestra of a Dublin theatre, he emigrated to Australia, where he lived for a considerable time in the bush, and then suddenly appeared in Sydney as a musician, and gave concerts in Australia, New Zealand, India, and America. In 1845, he came to England, and wrote his first opera, *Maritana*, which was an immediate success both in London and Vienna, and still holds the stage as one of the most popular of English operas. *Maid of Hungary* followed it in 1847. During a sojourn of some years in Germany, Wallace added further to his musical culture; and after again visiting America, composed *Lurline*, which was brought out in London in 1860, with even greater success than *Maritana*. In 1861, he produced *The Amber Witch*; in 1862, *Love's Triumph*; and in 1863, *The Desert Flower*. W. died at the Château de Bagen, in the south of France, 12th October 1865, leaving another opera, *Estrella*, nearly completed. Without possessing genius of the very first order, W. was a highly-cultivated musician; the freshness of the motives, and the brilliancy of the orchestration of his operas, particularly *Maritana* and *Lurline*, have stamped their author as one of the chief English composers of this century.

WALLENSTEIN (or, more correctly, WALDSTEIN), ALBERT-WENCESLAS-EUSEBIUS VON, Duke of Friedland, Sagan, and Mecklenburg, the most remarkable of the long series of eminent men who owe their prominence on history's page to the Thirty Years' War, was the third son of a noble though not wealthy Bohemian family, and was born at the château of Hermance, in Bohemia, 15th September 1583. His parents, who were Protestants, intrusted the care of his education to the Moravian brotherhood of Koschumberg, who, however, made little of their stubborn and passionate pupil. On his parents' death, his uncle, Albert Slavata, a zealous Catholic, took charge of the wayward youth,

and having won him over to his own creed, sent him to the Jesuit *convictorium* at Olmütz, and to the universities of Altorf, Bologna, and Padua, where his education, such as it was, was completed. W.'s course of training had not eradicated, or even moderated the prominent faults in his natural disposition; on the contrary, his wilfulness and independent spirit had gathered stability and strength from ineffective opposition; and his first prominent appearance on the stage of events shewed a man of extreme individuality, gifted with great and versatile ability, but equally remarkable for obstinacy, passion, and pride. He afterwards visited Germany, France, and Holland, took service in the imperial army, then engaged with the Turks in Hungary, and, returning home at the close of the war (1606), married an aged widow of noble rank, who, at her death (1614), left him the whole of her great wealth. This, along with the fourteen domains bequeathed to him by his uncle, made him one of the richest and most influential lords of Bohemia, a position recognised by the imperial court by the bestowal on him of the title of count and the military grade of colonel. A second marriage in 1617 with the daughter of Count Harrach, the emperor's favourite, and W.'s firm adherence to the imperial side during the Bohemian insurrection; his maintenance, at his own expense, of a large body of troops; and his brilliant and well-directed gallantry at the battle of Prague, and in various contests with Mansfeld and Bethlem Gabor, added a powerful influence at court to his hitherto only local eminence. The latter, however, was now much increased by his purchase, at much less than their value, of sixty confiscated lordships in Bohemia; and Ferdinand II. felt himself impelled to recompense the valuable services of his faithful subject by (1623) raising him to the dignity of a prince of the empire, with the title of *Duke of Friedland*. (Friedland is a town situated close to the Prussian frontier, about 60 miles north-north-east of Prague.) Two years after, when the impossibility of maintaining an army sufficient to restrain the Protestant League from uniting with the Danes against him, threw the emperor almost into despair, W., seizing such a favourable opportunity of gratifying his ambition, offered to raise, equip, and maintain 50,000 men free of charge, provided he were intrusted with the absolute command, and allowed to appoint his own officers: a proposal greedily accepted by the emperor. W. raised 30,000 in Bohemia; adventurers from all quarters flocked to his standard; and in a short time his army far exceeded the promised number. With this motley but not ill-disciplined array, he then marched into North Germany, and acting in concert with Tilly (q. v.), routed Mansfeld at Dessau, hunted him through Silesia and Moravia, and on his junction with the army of Bethlem Gabor in Hungary, compelled, by skilful strategy, the combined forces to remain on the defensive. Released by a truce with the Transylvanian prince and the death of Mansfeld, he returned by Silesia, recovered the fortresses which Thurn had captured, forced the Elector of Brandenburg to submit to the emperor, and joined Tilly in annihilating the military power of Denmark. The value of these services to the emperor's cause was inestimable, as Ferdinand well knew, and he accordingly turned a deaf ear to the loud complaints of the North Germans, who had suffered grievously from the rapacity, oppression, and licence which W.'s soldiers were allowed to exercise without the slightest opposition; and rewarded their leader by the gift of the Mecklenburg duchies, the rank of generalissimo on land, and admiral of the Baltic. W. speedily made himself master of his new

territory; fitted out a fleet of 15 sail, by the aid of which he captured Usedom and Rugen, with various Baltic ports, and laid siege to Stralsund. But the Danes annihilated his navy; and the Swedes succoured Stralsund, the siege of which he abandoned in despair. But as under cover of the dread inspired by W.'s arms, Ferdinand had resumed his tyrannical and aggressive schemes (see THIRTY YEARS' WAR) in Germany, the Catholic League, headed by the Duke of Bavaria, became bitter adversaries of W., and backed by the intrigues of France (which was represented at Vienna by Father Joseph, a master of subtle and unscrupulous diplomacy), partly forced and partly cajoled the emperor to dismiss W., an act for the probable consequences of which even Ferdinand, with his extraordinary fortitude, trembled. W., however, disappointed his sovereign's fears and his enemies' hopes by obeying with apparent cheerfulness, being somewhat moved thereto by the predictions of his favourite astrologer,* who declared his star to be only temporarily eclipsed, and that it would soon shine forth again with far greater lustre; and retired to Prague, where he lived in his magnificent palace in sovereign state, surrounded by a court composed of barons, knights, and the principal officers of his army. But the insult and injury he had received were eating into his soul; the frankness and affability to his subordinates, which had hitherto distinguished him, were changed for a gloomy taciturnity; and much of his time was spent in solitude, brooding over his wrongs, and scheming for revenge on the Duke of Bavaria, whom he justly accused of being the cause of his disgrace; though all the while he kept a calm but eager watch over the changes of opinion in the court of Vienna, where several of the ministers and numerous secret agents were either in his pay, or devoted to his interests. His eminent services, his immense popularity, and his great talents, pointed him out as the only hope of the empire after Tilly's death, and Ferdinand saw himself forced almost to kneel to his haughty subject, and beseech him again to gird on his sword; but W. for a long time affected the utmost indifference to re-engaging in active service, and at last consented only on such conditions as made him the independent ruler of the empire in military affairs. With the Swedes on the Danube, the Saxons in Bohemia, and the army of the League almost annihilated, the emperor had no choice; and W., three months afterwards, was at the head of 40,000 men, well armed and disciplined. But commands and entreaties were in vain employed to induce him to save Bavaria from the Swedes; and he lay idle at Leitmeritz, gloating over the pangs of his enemy, till, on Austria being threatened, he advanced to Egra, and by menacing at once Saxony and Nuremberg, brought Gustavus to a standstill. The two armies lay opposite each other for ten weeks, each suffering the extremities of famine, hardship, and sickness, in the hope of wearying out the other. At last, when half their numbers had succumbed, Gustavus, who had made a fruitless attempt to storm W.'s camp, retreated to the Danube, whence his skilful opponent soon drew him by marching on Saxony. The two again confronted each other at Lutzen (q. v.), and though W. was completely defeated, it was chiefly owing to the superior discipline and morale of his opponents. His army was recruited and reorganised in Bohemia; and, unable to make head against Saxons and

Swedes combined, he found it advisable to gain time by amusing his antagonists with illusory negotiations, after repeated vain endeavours to persuade the emperor to come to terms with the Protestant princes. Meantime his old enemies of the League were in full activity at Vienna; and the emperor, chagrined at the humiliations to which he had subjected himself to gain W.'s aid, was not slow to give credit, real or feigned, to their misrepresentations; his ill-concealed dislike was developed into hatred by the stubborn pertinacity with which W. insisted on the full observance of the terms of their agreement; and on W., who was kept well informed of the state of matters at court, attempting to attach his officers permanently to himself by obtaining their signatures (January 12) to an agreement to that effect, the emperor (January 24, 1634) declared him a rebel, and ordered two of his old officers, Piccolomini and Gallas, who had for some time been acting as spies on his actions, to take him dead or alive. W., with some devoted adherents, including a guard of 200 dragoons, took refuge in Egra, but was there assassinated, February 25, 1634. W. was tall, thin, and wiry, with lively brilliant eyes, tawny-reddish hair, and an unhealthy-looking, yellow complexion. 'He was far superior to his sovereign in true policy, liberality of sentiment, and religious toleration; but these qualities only rendered him more obnoxious to the bigoted emperor and his ministers.' As a general, he holds the foremost rank, vigilance and presence of mind, great judgment and unflinching perseverance, being his prominent characteristics; and of him alone can it be said that he checked the progress and foiled the designs of the great hero of Sweden. After his death, it was seen that the treacherous murder of one who had twice saved the empire from destruction called for some justification; and accordingly a paper was published by imperial authority, in which an attempt was made, by misrepresenting every overture he had made to his opponents, and every scheme he had employed to divide his numerous enemies at court, to prove that he had constantly meditated treason from the time of his first disgrace. This view and its opposite have found numerous and enthusiastic supporters; but without going further into detail, we may observe that the overtures made by him to the Swedes and Saxons while in command were undoubtedly *ruses de guerre*, and were invariably found to be such by his opponents; that when the Saxons invaded Bohemia, and took Prague, where he was residing in disgrace at the time, he took no part on either side, except such measures as an influential citizen would adopt for the safety of the inhabitants from insult and spoliation; and lastly, that when, after he had been declared a rebel, he *did* make 'treasonable' overtures to Bernhard of Weimar, the latter, though W.'s defection would at that time have been of the utmost importance, could not convince himself that this was not another artifice; a proof that the former overtures were as above stated.—See Cox's *House of Austria*; Harte's *History of the Life of Gustavus Adolphus* (1759), in which many particulars of W.'s career are supplied from the Itinerary of Carve, the chaplain to the assassin, Devereux; Gualdo-Priorato's *Historia della Vita d'Alberto Valstain, duca di Friland*; and Pelzel's *Geschichte der Böhmen* (Frague, 1774, 1779, and 1782).

WALLER, EDMUND, celebrated as one of the refiners of English poetry, was born at Coleshill, Herts, on March 3, 1605—1606. He was of an ancient and opulent family, and having passed through Eton and King's College, Cambridge, was returned to parliament, at the early age of 18, as member for

*W., during his attendance at the Italian universities, had deeply studied astrology; and although far too much has been made of this fact by his biographers, there is no doubt that the mystic doctrines of this pseudo-science had a strong hold on his mind, and at times much influenced his conduct.

Amersham, Bucks. In 1631, he married a London heiress, who died shortly afterwards; and the rich widower made suit to Lady Dorothy Sidney, eldest daughter of the Earl of Leicester, whom he poetically and perseveringly commemorated under the name of Sacharissa. Lady Dorothy, however, was inexorable: 'she was not to be subdued,' as Johnson says, 'by the powers of verse.' Meeting him in her old age, she asked the poet when he would again write verses upon her, and he ungallantly replied: 'When you are as young, madam, and as handsome as you were then.' In the Long Parliament, W. joined the party of Hampden (who was his cousin), and he was one of the commissioners appointed to negotiate with King Charles I. at Oxford in 1643. He was soon gained over by the royalists, and entered into a conspiracy against the dominant party in the House of Commons, for which he was fined £10,000, and banished the kingdom. His conduct on this occasion was mean and disgraceful. He not only confessed all he knew, but all that he suspected; attempted to criminate innocent persons, and humbled himself before the House of Commons in language inexpressibly abject and humiliating. After eight years' exile, spent in France and Italy, he was suffered to return to England; and he then became a supporter of the Commonwealth, and a panegyrist of Cromwell, to whom he was distantly related. When Charles II. was restored, W. was equally ready with a poetical congratulation; but his loyal strains were much inferior to those with which he had hailed the Protector; and it is said that when Charles reminded him of this fact, the poet wittily replied: 'Poets, sir, succeed better in fiction than in truth.' Up to his 80th year, W. continued a member of the House of Commons, delighting all parties by his wit and vivacity. He died at Beaconsfield, October 21, 1687. W. began early to write verses, and published two collections of his poems—one in 1645, and another in 1664. An edition appeared in 1711, edited by Atterbury; and one in 1729, with copious 'Observations' by Fenton. Pope has eulogised the *sweetness* of W.'s verse. Some of his smaller pieces are characterised by infinite grace and harmony; he has also occasional dignity and striking imagery, as in the lines on Cromwell; and he is never involved or obscure; yet his rank among our poets is but a subordinate one, as he is deficient in passion, energy, and creative power.

WALLFLOWER (*Cheiranthus*), a genus of plants of the natural order *Cruciferae*, having the siliques quadrangular from the prominence of the nerves on the back of the valves, the seeds in a single row in each cell, the stigma deeply 2-lobed, the lobes bent back. The flowers are in racemes. The species are annual, biennial, or perennial herbaceous plants, some of them almost shrubs. The Common W. (*C. cheiri*) is found in rocky places and on old walls in the south of Europe, and also, but less abundantly, in the middle of Europe and in Britain. In its wild state, its flowers are always yellow; but in cultivation, they exhibit a considerable diversity of colours, chiefly brown, purple, and variegated; and they attain a larger size. It is a universal favourite, on account of the delicious odour of its flowers. The varieties in cultivation are very numerous; but there are among them no marked distinctions. Double and semi-double flowers are not uncommon. The plant is perennial, but in gardens is generally treated as a biennial, although fine kinds are propagated by cuttings, which soon strike root under a hand-glass. The ordinary mode of cultivation is to sow the seed of an approved kind, and to plant out the seedlings. The flowers of W. have a bitter and

cross-like taste, and were formerly used as a medicine.

WALLINGFORD, a small, but ancient and interesting, parliamentary and municipal borough of England, mostly in the county of Berks, and on the right bank of the Thames, 13 miles north-north-west of Reading. Of its three churches, that of St Leonard's—rebuilt in 1849—has a Norman doorway. The earthworks with which the Romans encompassed the town, are still distinctly traceable. The diversion of the London and Oxford Road from W. much injured the old town, and it is now a place of little consequence. The borough returns one member to the House of Commons. Pop. (1861) of municipal borough, 2793.

WALLIS, REV. JOHN, D.D., a very eminent English mathematician, was the eldest son of the Rev. John Wallis, incumbent of Ashford in Kent, and was born there, November 23, 1616. He was brought up with a view to the church, and was educated for his profession, to the strict exclusion of all other branches of knowledge, in accordance with the prevailing practice of the time, which was in his case carried to such an extent that even ordinary arithmetic was wholly neglected. W. never saw a book of arithmetic till he was 15 years old, and then only by accident. At the age of 16, he was entered at Emmanuel College, Cambridge, where at that time mathematics found no place in the course of study, being esteemed merely mechanical. After a brilliant career, he took his degree, was chosen a Fellow of Queen's, and took orders in 1640. On the outbreak of the civil war, he sided with the parliament, and was of great use to his party in deciphering intercepted correspondence, an art in which like Vesta (q. v.) and Battista la Porta, he was eminent. In 1644, he was one of the secretaries of the Assembly of Divines at Westminster, holding at that time the living of St Gabriel, Fenchurch Street; and, in the following year, he joined with other eminent men in the establishment of the meetings for mutual instruction, which, 17 years afterwards, developed into the Royal Society. It was not till 1647 that he commenced the study of mathematics; and, in 1649, he was chosen Savilian Professor of Geometry at Oxford. The rapid progress he had made in his mathematical studies was evidenced by the publication of his greatest work, the *Arithmetica Infinitorum*, with a treatise on Conic Sections prefixed, in 1655. In the same year commenced his well-known controversy with Hobbes—regarding a quadrature of the circle, which the latter believed he had effected—which was continued at intervals till 1663, and was marked by the usual quaint caustic satire of the time. W. had, of course, the right side of the dispute; but unfortunately for posterity, his manly feeling of forbearance towards a deceased antagonist (Hobbes died in 1679) prevented him from admitting his polemical treatises into the collection of his works, which was published 1693—1699. Numerous other mathematical works, as the *Mathesis Universalis* (1657), *Commercium Epistolicum* (1658), *Cuno-Cuneus* (1663), *De Proportionibus* (1663), *De Astu Maris* (1668), a treatise on Mechanics (1669, 1670, 1671), editions of the works of Horrocks (1673), of the Arenarius and Quadrature of Archimedes (1676), and of Ptolemy's Harmonics (1680), a treatise on Algebra (1685), an edition of Aristarchus and of Pappus (1688), &c., were the products of his originality and industry. We have besides numerous minor theological works, polemical and expository, from his pen, none of which, however, are important enough to call for mention. Of his other works, the treatise on Logic

(1687) is of the highest excellence, and even at the present day is well worthy of perusal; and his English Grammar (1653), written in Latin for the use of foreigners, has only of recent years, when the true principles of grammar are becoming better understood, received the attention it merits. About 1658, W. joined the party who were in favour of a restoration of kingly government, and his talent for deciphering was now put in practice against his former friends, an act for which he has been abused with virulent injustice. At the Restoration, he was confirmed in his professorship, was appointed keeper of the archives at Oxford, and royal chaplain. In 1692, he was consulted as to the adoption of the Gregorian Calendar, and his strong disapproval decided the government to retain the old style. He died 28th October 1703.

It is exclusively as a mathematician that W.'s name has obtained permanently a niche in the temple of fame; though as an expositor of the cardinal doctrines of Christianity he was fully on a par with South and Sherlock; but his eminence in the former character has thrown into shade even his services as a scholar, and few at the present time remember that it was he who first edited the musical works of Ptolemy, Porphyrius, Aristarchus of Samos, and the later work of Briennius, though the manner in which these labours were effected indicates unquestionably an immense expenditure of labour, and a high degree of scholarship. His *Arithmetica Infinitorum* is a successful attempt to solve, by means of the summation of series to infinity, a number of the more simple problems of the calculus, such as the evaluation of all cases of $\int x^n dx$; and, in extension, to dis-

cover the limit of $\int (a^2 - x^2)^n dx$, of which the quadrature of the circle is a particular case. There are numerous other results, which are, at the present time, considered to belong to the more advanced stages of the calculus; and, in fact, W. is another example of the strange blindness which, in full possession of a principle, neglects to suit it with a generalised form of expression. The best known of W.'s results is his formula for π , which gives

$$\frac{\pi}{4} = \frac{2 \cdot 4 \cdot 6 \cdot 8 \dots}{3 \cdot 3 \cdot 5 \cdot 5 \cdot 7 \cdot 7 \dots} \text{ ad infinitum.}$$

WALLOONS, the name given to a population belonging to the great Romanic family, more especially to the French stock, and occupying the tract along the frontiers of the German-speaking territory in the South Netherlands, from Dunkirk to Malmédy. They are located more particularly in the Ardennes, in parts of the departments of Pas-de-Calais, Nord, Aisne, and Ardennes in France, but chiefly in South Brabant, as well as in the provinces of Hainault, Namur, Liège in Belgium, and in the greater part of Luxemburg, and finally in some towns and villages in the neighbourhood of Malmédy in Rhenish Prussia. The W., whose numbers in Belgium, where they are principally established, are stated at 1½ millions, are the descendants of the old Gallic Belgæ, who held their ground among the Ardennes Mountains when the rest of Gaul was overrun by the German conquerors, but became eventually Romanised, especially in their language, which appears now as a patois or popular dialect of French; of all the French dialects, however, the greatest number of Gallic words have been preserved in it. See the unfinished work by Grandgagnage, *Dictionnaire Étymologique de la Langue Wallone* (Liège, 1845). The name W., in Dutch, *Walen*, sufficiently shews their Gallo-Romanic origin and their relationship, partly by race and partly by language, with the Galli, Gaels, Walese, Welsh, Walachians, &c. The Walloons of the

present day resemble their French more than they do their German neighbours. They are squat and middle-sized, with powerful limbs, dark hair, deep sunk, fiery, dark-brown or blue eyes. They surpass their Flemish neighbours in adroitness, activity, and skill; and their French in earnestness, perseverance, and diligence. In impulsiveness, they resemble the latter more than the former, but their anger sooner cools than that of the more deeply feeling Fleming. It is worthy of notice that the Belgian revolution was pre-eminently the work of the Walloon districts, and the most eminent statesmen of modern Belgium are of Walloon descent. It was against the Walloon spirit and tendencies that the Flemish movement (see FLEMISH LANGUAGE AND LITERATURE) was chiefly directed.

WALL-PIECE, a small cannon (or, in ancient times, an arquebuss) mounted on a swivel, on the wall of a fortress, for the purpose of being fired at short-range on assailants in the ditch or on the covert-way. There are distinct evidences that the great wall of China was originally constructed for the reception of wall-pieces.

WALL-PLATE, a piece of wood laid along the top of the wall of a building to receive the feet of the rafters of the Roof (q. v.).

WALL-TREES, in Horticulture, are fruit-trees trained on walls for better exposure of the fruit to sunshine, and for the sake of the heat radiated from the wall. Brick walls are generally preferred, and have a great advantage in the regularity with which the nailing can be accomplished, but trees are often also trained on stone walls, and the walls of houses are sometimes used for this purpose. Trees are trained on walls in-hothouses as well as in the open air. Fluted walls are often used, the fruit being thus partially forced by artificial heat; and screens of various kinds, as of reeds, canvas, and oiled paper, are sometimes employed to protect blossoms in spring. Woollen nets are also much used for this purpose, and a net even with wide meshes affords much protection from spring frosts. Wall-trees, intended permanently to occupy the wall, are generally trained in the nursery with a dwarf stem only five or six inches in length, so that the branches may cover the whole wall, and no available part of it may be lost. It is usual, however, in planting to introduce *riders* alternately with the permanent wall-trees, which are grafted or budded on tall stocks, and occupy part of the wall till the other

Horizontal Form.

trees have become large enough to require it all for themselves. Garden-walls are generally 12 or 14 feet in height. Different modes of training wall-trees are practised, of which the principal are known as *fan training* and *horizontal training*. In the former, the branches are arranged like the spokes of

a fan; in the latter, a main stem is led up, from which they are spread out horizontally on both sides. Different modes are preferred for different

Fan Form.

kinds of trees, and the art of the gardener is displayed in keeping to his plan of training, and *laying in* branches so as completely to fill up the space, and make every part of the wall productive. There is a Dutch mode of training, which consists in leading two chief branches horizontally to right and left, and training shoots from them straight up to the top of the wall. It is seldom employed in Britain,

Half-fan.

except for white currants. Riders are not unfrequently trained in a star-like form, some branches being led downwards, in order to fill the wall as quickly as possible. It is necessary for the gardener, in training wall-trees, to consider the habit of each kind, particularly whether fruit is chiefly to be expected on young branches or on the *spurs* of older branches. Superfluous branches must in all cases be carefully removed, and amongst these are to be reckoned all *fore-right shoots*, or branches which project straight from the wall. The use of small strands of cloth, along with nails, to fasten branches to walls, is familiar to every one. These strands are renewed from year to year, so that they may not cause disease by interfering with the growth of the branches.

WALNUT (*Juglans*), a genus of beautiful trees of the natural order *Juglandaceæ*. This order is nearly allied to *Amentaceæ* (q. v.), and particularly to the sub-order *Cupulifera* (q. v.), or *Corylaceæ*, but differs in having the ovary one-celled, with a solitary erect ovule. The flowers are unisexual, the male flowers in catkins, the female in terminal clusters. The species, of which not quite thirty are known, are mostly natives of North America; a few

are found in Asia. All are trees with alternate pinnated leaves. The genus *Juglans* is distinguished by monocious flowers, with 18—24 stamens; and a drupe with a deciduous fleshy husk, which bursts irregularly, and a deeply wrinkled shell (*putamen*) of two valves, within which is the seed, curiously lobed and wrinkled, with a membranaceous *testa* and partial dissepiments. The species of Hickory (q. v.) were formerly included in this genus.—The COMMON W. (*J. regia*) is a native of Persia and the Himalaya, but has long been cultivated in all parts of the south of Europe. The date of its introduction is unknown, but it was certainly cultivated by the

Walnut (*Juglans regia*).

Romans in the reign of Tiberius. It is a lofty tree of 60—90 feet; with large spreading branches. Its foliage resembles that of the ash. The leaves have 2—4 pair of leaflets, and a terminal one. They have a fine balsamic odour when bruised; this quality, however, being much more marked in some trees than in others. An infusion of them has been found useful in scrofula; and when bruised and rubbed on the skin, they are efficacious in curing itch. Placed in wardrobes, they prevent the ravages of moths. The sap is limpid like water, but contains much sugar, so that the tree is sometimes tapped for it, like the sugar-maple, and the sugar is procured by evaporation. A pleasant kind of wine is also made from it. An excellent pickle and a kind of ketchup are made of the unripe fruit. The ripe fruit is one of the best of nuts, and is an important article of export from many parts of the south of Europe. Walnuts are also exported in large quantities from Cashmere and other Himalayan regions to supply the markets of India. The outer husk is removed before the nuts are brought to market. In the south of Europe, walnuts are a very considerable article of food, and when perfectly fresh, they are wholesome and nutritious, although in the state in which they are imported into Britain they are not easily digestible. Just before they are ripe they are much used in France with vinegar, salt pepper, and shallots. Among the varieties of W. in cultivation is one with a very thin shell, which is much esteemed. Walnuts yield by expression a bland fixed oil, which, under the names of *Walnut Oil* and *Nut Oil*, is much used by painters, and in the countries in which it is produced is a common article of food. The *cake* left after the expression of the oil is sometimes used as an article of food, and is also used for feeding cattle and poultry. The timber of the W. is of great value, and is much

used by cabinetmakers. Gun-stocks are made of it. It is light, although hard and fine-grained. The wood of young trees is white and little esteemed; that of old trees is brown, veined and shaded with darker brown and black. The wood of the roots is beautifully veined. Both the root and the huaks of the W. yield a dye, which is used for staining light-coloured woods brown. The W., when meant to become a timber-tree, is best sown where it is to remain, as the roots are much injured by transplanting. The best kinds of W. for fruit are generally grafted.—The W. succeeds well in Britain as an ornamental tree, even in the north of Scotland, although it seldom quite ripens its fruit except in the warmest parts of England. It was probably brought to England by the Romans. It takes its name from being foreign (A.-S. *wealh* or *walh*).—Very similar to the Common W. is the BLACK W. (*J. nigra*) of North America, found in most parts of the United States, except the most northern. It is a very large and beautiful tree, the trunk sometimes six or seven feet in diameter. The leaves have more numerous leaflets than those of the Common Walnut. The timber is even more valuable than that of the Common W., and is used for the same purposes. The fruit, however, is very inferior, although it is sold in the markets of American cities. The partial dissepiments of the kernel are thick and woody.—The BUTTER NUT (*J. cinerea*) is abundant in the northern and north-western states of North America, and in Canada. It is a tree only about 50 feet high, with trunk about a foot in diameter; leaves with 15–17 leaflets; the fruit elongated, and externally covered with a viscid substance. The nut is hard and rough, with prominent ridges, of good quality, and sometimes brought to market in America. The wood is not apt to split or warp, and is useful for many purposes. Sugar is obtained from the sap, as from that of the maple, but is of inferior quality. The inner bark is a mild cathartic, resembling rhubarb in its properties. The leaves, reduced to powder, are used for blistering, like cantharides.—To the natural order *Juglandaceæ* belongs the genus *Engelhardtia*, found in the Malayan Archipelago and the Himalaya. The wood of *E. Roxburghiana*, a Himalayan species, is much valued by turners.

WALPOLE, SIR ROBERT, third son of Robert Walpole, M.P., by Mary, daughter of Sir Jeffrey Burwell, was born August 26, 1676, at Houghton, in Norfolk. He received his education at Eton and at King's College, Cambridge. On July 30, 1700, he married Catharine, daughter of Sir John Shorter, Lord Mayor of London. On 28th November following, he succeeded to the family estates on the death of his father. In 1702, he was elected member of parliament for King's Lynn; and in 1705, he was nominated one of the council to Prince George of Denmark. In this latter capacity, he appears to have won the esteem of Godolphin, Marlborough, and other Whig leaders. In 1707, he was appointed Secretary at War; and in 1709, Treasurer of the Navy. Shortly after this, however, his fortunes suffered a temporary eclipse. He was found guilty by the House of Commons of 'a high breach of trust and notorious corruption,' and accordingly, on January 17, 1712, he was expelled the House, and sent to the Tower. There can be little doubt that he had all his life a profound faith in bribery, and never scrupled to exercise it; but his punishment on this occasion seems rather to have been the result of party animosity than of virtuous indignation on the part of the House. He had all along been a strong Hanoverian, and on the accession of George I., he was restored to fortune. He was made a privy-councillor, and had various other

high offices conferred upon him. On the impeachment of Bolingbroke and others by his means, he became, in 1715, Chancellor of the Exchequer, and First Lord of the Treasury. A disunion of the cabinet having arisen in 1717, he resigned office, bringing in a Sinking-fund Bill on the day of his resignation. In opposition, he was the determined enemy of the South Sea Scheme. He was recalled to office on the retirement of the Earl of Sunderland in 1721; and from this time to his final retirement in 1742, the life of W. may be said to be the history of England. In 1723, his son was created Baron Walpole. In 1737, his power was a good deal shaken by the disputes which had arisen between the king and the Prince of Wales; the latter siding with the Opposition, which began to grow very formidable in the questions which arose about this time between England and Spain. W. was opposed to war; the grand principle of his action being, according to Archdeacon Coxe, 'the love of peace;' according to Macaulay, however, his aim was not the peace of his country, but of his own administration. In 1740, a motion was made in the House to petition the king to remove Sir Robert W. 'from his Majesty's presence and counsels for ever.' This motion was negatived by a large majority; but the power of the great minister was evidently shaken. He resigned on 2d February 1742, when he was created Earl of Orford, with a pension of £4000 a year. Charges of bribery were now brought against him, and a committee of investigation was ultimately appointed by the House of Commons. It consisted of 21 members, of whom only two were of his own party. The Report was against him, but it was unsupported by evidence, and proceedings were ultimately dropped. The rest of W.'s life was spent in tranquillity and retirement. He died in 1745, aged 68. In private life, he was amiable and good-tempered. Love of power appears to have been his ruling motive of action. He had strong common sense, with clearness of political vision, and next to his own interest he had at heart the interest of his country. Doubtless, he bribed largely, but as Macaulay says: 'We might as well accuse the poor Lowland farmers who paid black-mail to Rob Roy, of corrupting the virtue of the Highlanders, as accuse Sir Robert Walpole of corrupting the virtue of parliament.'—See Coxe, *Memoir of Life and Administration of Sir Robert Walpole* (Lond. 1798); and Lord Macaulay's Essay on *Walpole's Letters to Sir Horace Mann*.

WALPOLE, HORACE, third son of Sir Robert Walpole, first Earl of Orford, was born in 1717. He was educated at Eton and Cambridge. After finishing his education, he travelled abroad for some years, principally in Italy, where he seems to have acquired those tastes for which he afterwards became so well known. In 1741, he returned to England, and took his seat in parliament. But he had no taste for politics, and never took any active part in public life. In 1747, he purchased a piece of ground near Twickenham. Here he built his famous mansion—Strawberry Hill. Its erection and decoration may almost be said to have formed the principal occupation of his long life. In 1758, he published his *Catalogue of Royal and Noble Authors*. This was followed by *The Castle of Otranto*, *The Mysterious Mother*, and the *Historic Doubts on the Life and Reign of Richard III.* The works, however, to which he owes the preservation of his name are his *Letters*. These will always be interesting as pictures and records of the society and fashionable gossip of his day. Their interest is, however, considerably marred by their palpable want of truthfulness. On the death of his nephew in 1791, he became fourth Earl of Orford. He died in his 80th

year on March 2, 1797. 'The faults of Horace Walpole's head and heart,' says Macaulay, 'are indeed sufficiently glaring. His writings, it is true, rank as high among the delicacies of intellectual epicures as the Strasburg pie among the dishes described in the *Almanach des Gourmands*. But as the *pâté de foie gras* owes its excellence to the diseases of the wretched animal which furnishes it, and would be good for nothing if it were not made of livers preternaturally swollen, so none but an unhealthy and disorganised mind could have produced such literary luxuries as the works of Walpole. . . . The conformation of his mind was such that whatever was little seemed to him great, and whatever was great seemed to him little. Serious business was a trifle to him, and trifles were his serious business.'—See *Letters*, edited by Mr Peter Cunningham (8 vols., 1857); also Macaulay's *Essay on Letters of Horace Walpole*.

WALPURGA, or WALPURGIS, St (otherwise *Walburga*), followed her brothers St Wilibald and St Wunnibald (sons of a king of the West Saxons), in the time of St Boniface, from her native country, England, to Germany, to help them in extending Christianity. Wilibald established the bishopric of Eichstadt about 741; and Wunnibald, the neighbouring convent of Heidenheim about 745, the direction of which last W. undertook, after his death (about 763), as the first abbess, and continued till the end of her own life (778). Her bones, from which, according to the oldest biography, a miraculous healing oil flowed, were transferred to Eichstadt, where a convent was erected in her honour. That old biography was written towards the end of the 9th c. by a monk, Wolfhart, in the monastery of Hasenried, and contained, like all the later legends, which are based solely upon it, only a multitude of marvellous stories of the usual stamp. A somewhat more special significance lies in the trait that W. was not molested by biting dogs, and was in consequence invoked for protection against them and other ferocious animals. The veneration of W. became widespread. Throughout all Germany, and even in France, the Netherlands, and England, churches and chapels were dedicated to her, relics of her were shewn, and festivals celebrated in her honour. The feast of Walpurga falls properly on the 25th of February; but as in some German calendars it is assigned to the 1st of May, the name of W. has become associated, in a quite accidental way, with some of the most noted popular superstitions. The 1st of May had been one of the most sacred days of all paganism; it was the time of a great sacrificial festival, and of the old May assembly of the people. For centuries on the 1st of May, informal courts of justice continued to be held, the joyful May procession took place, and the kindling of the sacred May-fire. See BELTEIN. When afterwards the old heathen gods had been completely degraded into devils by the Christian missionaries, and when the belief in witchcraft had come in vogue, the Walpurgis-night obtained naturally a notorious significance, inasmuch as, during the night between the 30th of April and the 1st of May, the witches were held to ride on broom-sticks and he-goats to the old places of judgment and sacrifice, in order to enjoy themselves there with their master the devil. Such witch-hills were tolerably numerous in Germany and the neighbouring countries. The best known, however, was the highest point of the Harz, the Brocken, Brocks or Blocksberg, which has obtained a wide celebrity as the scene of the witches' Sabbath in Goethe's *Faust*.

WALTRUS. See MORSE.

WALSALL, a municipal and parliamentary borough, Staffordshire, stands amid pleasing scenery on a small stream, an affluent of the Tame, eight miles north-north-west of Birmingham. Its public buildings are accounted more than usually handsome, and embrace a number of churches, a free grammar and other schools, and a number of charitable institutions. The iron manufacture, for which the situation of the town on the edge of the South Staffordshire mineral field affords facilities, is the staple branch of industry. Tanning, carrying, the manufacture of harness and harness furniture, and of every description of leather goods, are extensively carried on. Coal and lime works are in operation in the vicinity, and there is an extensive trade in malt. W. returns one member to the House of Commons. Pop. (1861) 37,760.

WALSINGHAM, SIR FRANCIS, English statesman, of an ancient Kentish family, third and youngest son of William Walsingham of Scadbury, was born at Chiselhurst, Kent, in 1536. He studied at King's College, Cambridge, and afterwards travelled on the continent, where he remained until the accession of Queen Elizabeth. Burleigh, with his usual discernment in selecting men of talent, discovered his abilities, brought him into office, and sent him on an embassy to France in August 1570. He remained in Paris until April 1573, and discharged diplomatic duties with such consummate skill that he was, on the recommendation of his great patron, appointed one of the principal secretaries of state to Elizabeth. He was also sworn of the privy council, and knighted. In 1578, he was sent on an important embassy to the Netherlands; in 1581, to France; and in 1583, to Scotland. He was, with some reason, regarded by the adherents of Mary, Queen of Scots, as the most insidious of her enemies in the English council. He contrived to intercept most of her letters, and after having deciphered them, sent them to their destination, in order to obtain fresh intelligence from their answers. Some of these deciphered letters are preserved in the British Museum. W. soon held Mary secure in the toils. Some time previous to September 1583, he had bribed to his service Cherelles, the secretary to the French ambassador Castelnau, in whom Mary placed implicit confidence. W. also won over Gray, the envoy of the Duke of Guise and other friends of Mary to James VI. (James I. of England), who employed him to manage his correspondence with his mother and his friends in France. The most secret letters of Mary and of James thus came into the hands of Walsingham. Up to Babington's conspiracy, or, as some have called it, W.'s conspiracy, there was no evidence for charging Mary with being accessory to any of the plots formed against the life of Elizabeth. The real fountain-head of this conspiracy, and the chief confederates, were spies in the pay of W., and all the correspondence of Mary and her friends passed into the hands of Elizabeth's dexterous minister. After the discovery and execution of Babington, &c., W. went to Fotheringay as one of the commission to try Queen Mary. She charged him with having forged the correspondence produced against her, when W. rose in his place and solemnly called God to witness that he had not done anything unworthy of an honest man, and that he was wholly free from malice. Elizabeth signed her death-warrant with a jest on W.'s hatred of the Queen of Scots. She had ordered Davison to bring her the warrant, and when she had signed it she said: 'Go; tell all this to Walsingham, who is now sick; though I fear he will die for sorrow when he hears it.' W. was distinguished even among the ministers of Elizabeth for acuteness of penetration, extensive knowledge of public affairs, and profound acquaint-

ance with human nature. His administration of foreign affairs was founded on the system of bribery, espionage, and deception. He is said to have had in his pay 53 agents and 18 spies, in various countries; and no minister was better informed of the intrigues of foreign courts. Notwithstanding this diplomatic duplicity, which was then universal among public men, W.'s personal integrity and disinterested patriotism are undoubted. He was of strict morals, favoured the Puritan party, and in his later days gave himself up to religious meditation. He retired from public affairs some time before his death, and resided at his house in Barn Elms, where he died, April 6, 1590. Elizabeth was ready enough to acknowledge his diligence, genius, and important services, yet she kept him poor. There remain in the British Museum (Harleian MSS.) various letters from W. complaining of his being wholly unable, on his scanty appointments, to support his establishment, though very inadequate to his dignity of ambassador in France. Camden says he died so far in debt that he was buried privately by night in St Paul's Church, without any funeral solemnity. The queen was chary even in conferring honours upon him, for he received nothing but his knighthood, and held no offices when he resigned the charge of foreign affairs. He was married, and his daughter Frances became successively the wife of Sir Philip Sidney, of the brilliant and unfortunate Earl of Essex, and of the brave soldier, Richard de Burgh, 4th Earl of Clanricarde.

WALTHAM, a village of Massachusetts, U. S., on Charles River and the Fitchburg Railway, ten miles north-by-west from Boston, has a broad street of handsome residences, and manufactories of bleached cotton goods, hollow iron-ware, machinery, chemicals, boots and shoes, and machine-made watches, of which 10,000 are made a year. Pop. (1860) 6397.

WALTHAM ABBEY, a market-town in the county of Essex, on the banks of the Lea, 13 miles north of the east part of London, on the Great Eastern Railway. It contains a spacious Norman church, originally belonging to an abbey. The river Lea here divides into several branches, which are made to turn a number of gunpowder and flour mills belonging to government. Enfield Lock, at which is situated the celebrated government factory for rifles, &c. (see **SMALL-ARMS FACTORIES, ROYAL**), is about a mile distant; and many of the hands there employed live in and around Waltham Abbey. Pop. (1866) 7000.

WALTHER VON DER VOGELWEIDE, the greatest and most famous Minnesinger (q. v.) of the middle ages, was born 1165—1170, in Franconia or in Austria. Although his family was noble, he had no possessions, and became a minstrel as much, perhaps, from necessity as from impulse. His master and early model was the elder Reinmar. It is thought that his first public performances in 'singing and saying' date from about 1187; soon after which, he found a warm patron in Friedrich the Catholic, Duke of Austria. But this prince having died in 1198, W. began the life of a wandering minstrel, in the course of which he visited the courts of most of the German sovereigns. A few details of his career are known. He twice (1199 and 1205) spent some time at the court of the Emperor Philipp; and then lived six years at Eisenach with a generous patron, Hermann, Landgraf of Thuringia. During 1214—1215, he repeatedly visited the Emperor Otho, by whom, as well as by Philipp, he seems to have been treated with unkingly parsimony. From 1217 to 1219, he lived with Duke

Bernhard in Carinthia, then returned to Austria, and in 1220 received from Friedrich II. a small estate at Würzburg. He died about the beginning of 1228. His grave has long been pointed out in the Laurence Garden of the cathedral of Würzburg; but a new monument was erected to him in 1843. W. far excelled his master Reinmar, whom he survived about 20 years, both in matter and style; while in richness and versatility of mind all the other Minnesingers must stand far behind him; for, to his wide sympathies and matured art, all themes were alike: tenderness and depth, no less than cheerfulness and gaiety, deep earnestness, as well as playful railery. He did not confine himself, like Reinmar, to minnelays, but wrote also hymns, eulogies of his patrons, and didactic pieces. He sang of the duties and dignities of the emperor; of the obligations of princes and vassals; of the rights and wrongs of the question between the pope and the emperor; of the glory of the true church; and often his song conveyed earnest and cutting censure. But it was only on conviction that he gave praise or blame, never influenced by favour or prejudice; and his censures of the church were those of a candid but pious believer. From a decided patriotic feeling, he stood firmly by the empire and the emperor in opposing the pretensions and usurpations of the pope. His writings on this subject had a widespread and powerful effect; they alienated, according to the testimony of a contemporary, Thomasin, thousands from the pope, and determined the politics, so to speak, of the German poets for the whole century. W. was soon recognised by his contemporaries as the master of lyric poetry; and the traditions of the later Minnesinger schools place him among the twelve who, in the Emperor Otho the Great's time, originated and established the noble art of minstrelsy. Lachmann brought out a masterly critical edition of W.'s writings (Berl. 1827, 3d. ed. 1853); and Simrock an excellent translation (with explanations by Simrock and Wackernagel, 2 vols. Berl. 1833; 2d. ed. Leip. 1853); Uhland wrote a beautiful account of his life and writings (*W. von der Vogelweide, ein allddeutscher Dichter*, Stuttgart, and Tüb. 1822); and Hornig, a complete *Glossarium* to his poems (Quedlinb. 1844).—See Reusaz, *W. von der Vogelweide* (Würzb. 1843); Daffis, *Zur Lebensgeschichte W.'s von der Vogelweide* (Berl. 1854).

WALTON, ISAAC, author of the *Complete Angler*, was the son of one Jervis Walton, a yeoman, and was born at Stafford on 9th of August 1593. Of his earlier life, not much is certainly known. In the year 1624, we find him settled in Fleet Street, London, and carrying on business there as a hosier. In the end of 1626, he married Rachel Floud, a descendant of Archbishop Cranmer. From George Cranmer, her uncle, who had been a pupil and friend of Hooker, it is thought likely that W. derived much of the material for his *Life* of that eminent man. In August 1640, she died in giving birth to a daughter, having before had two sons, neither of whom survived her. In 1643, W. retired from business with such a modest competence as sufficed for the simple way of life he affected; and in 1647 he married a second time. The lady was Anne Kenn, half-sister of the well-known bishop of that name. She bore to him a daughter and two sons, only one of whom lived, and died in 1662, to the great grief of her husband, who survived her many years. He died on the 15th December 1683, at the great age of ninety, in the house of Dr Hawkins, his son-in-law, prebendary of Winchester Cathedral, and was buried in the vault of that sanctuary.

With the celebrated Dr John Donne, who died in 1631, W., who attended his ministry, had been on

terms of affectionate intimacy; and on the publication of his sermons in 1640, he was induced to preface them with a Life of the author. This, his first publication, was followed by Lives of Hooker, Sir Henry Wotton, and George Herbert, in succession; the whole four being reissued in a collected edition in 1670. In 1678, the life of his friend, Bishop Sanderson, was added. *The Complete Angler, or Contemplative Man's Recreation*, was published in 1655, and it instantly attained the popularity which to this hour it continues to enjoy. In 1655, 1664, 1668, and 1676, successive editions were called for. To the edition of 1676, a little treatise on Fly-fishing was added by Walton's friend, Charles Cotton, in a fishing-house built by whom, on the banks of the river Dove, many of the later days of his happy and blameless life lapsed peacefully in the pursuit of his favourite recreation. *The Complete Angler*, as a treatise on the art of angling, may be regarded as in good part obsolete, but it continues and will continue to be read for its charming simplicity of manner, its pastoral freshness and poetry, and the pure, peaceful, and pious spirit which is breathed from its quaint old pages. The Lives, though somewhat less widely known, are in their kind not less exquisite and *unique*. Wordsworth has dedicated to them a beautiful sonnet, in which he speaks of the five saintly names of the subjects of them as

Satellites burning in a lucid ring
Around meek Walton's heavenly memory.

WALTZ (Ger. *Wälzer*, literally, roller), a national German dance, said to have originally come from Bohemia. It first became a fashionable dance in the other countries in the early part of the 19th century. It is danced to music of $\frac{3}{4}$ time by any number of couples, who, with the gentleman's right arm round his partner's waist, wheel rapidly round on an axis of their own, advancing at the same time round the room. Of late years, a modification of the dance, called the *Valse à Deux Temps*, has been very generally adopted, which is perhaps hardly equal in gracefulness to the older waltz, as the step is less correspondent to the rhythm of the music.

WAMPUM, a name given to shells and shell-beads, used as money, and worn for ornaments in strings and belts by the North American Indians.

WANDERING JEW. See **JEW**, THE **WANDERING**.

WANDEROO, a name which has been given to several species of monkey. The species commonly described under the name is *Macacus silenus* or *Silenus veter*, a native of the coast of Malabar, a monkey of rather large size, deep black throughout, except a ruff of long gray or white hair, from the midst of which the face looks forth, and which descends over the chest, giving the animal a very peculiar aspect. This monkey exhibits considerable intelligence and docility, and performs its tricks with an absurd air of gravity.—The name **W.**, however, more properly belongs to monkeys of the genus *Presbytes*, natives of Ceylon, to which it is given by the Singhalese, and appears to have been transferred by mistake to the species just described, which is not found in Ceylon. The waderos of Ceylon are all small monkeys. The best known species is *Presbytes cephalopterus*, found in the low parts of the island. It feeds chiefly on the berries and buds of trees, and is seldom seen on the ground. Twenty or thirty are generally found together in a troop. When alarmed, they display marvellous agility in leaping, or rather swinging from branch to branch, using their powerful arms alternately, often flinging themselves obliquely so as to catch the lower bough of an opposite tree, and taking advantage of its

rebound to carry them up again till they can reach a higher branch; the females, all the while, being often encumbered by their young, which cling to them. This monkey is far from being so mischievous as monkeys in general. 'In captivity, it is remarkable for the gravity of its demeanour, and for an

Wanderoo Monkey (*Macacus silenus*).

air of melancholy in its expression and movements, which is completely in character with its snowy beard and venerable aspect.'—Tennent's *Ceylon*. Its disposition is extremely gentle and affectionate, it is intelligent and docile, and very cleanly in its habits.—Several other species of **W.** or *Presbytes* are found in Ceylon, some of them in the more elevated parts of the island.

WA'NTAGE, a market-town in Berkeshire, in the Vale of the White Horse, 26 miles west of Reading, and 60 west of London. It manufactures agricultural implements, and has an extensive trade in corn. Pop. (1866) 3064.

WAPENSHAW (Sax. *wæpen*, weapon, and *scawan*, to shew), a periodical gathering of the people, instituted by various Scots statutes, for the purpose of exhibiting their arms, these statutes directing each individual to be armed on a scale proportioned to his property. There are numerous Scots acts of the 15th and 16th centuries regulating the subject of wapenshaws. In the time of war or rebellion, proclamations were issued charging all sheriffs and magistrates of burghs to direct the attendants of the respective wapenshawings to join the king's host. During the reign of the later Stuarts, attendance on the wapenshaws was enforced with considerable strictness; and in addition to military exercises, sports and pastimes were carried on by authority at these gatherings. The Covenanters, in consequence of these sports being of a kind disapproved of by them, did what they could to discourage attendance on the wapenshaws.

WA'PENTAKE (Sax. *wæpen*, arms, and *tae*, touch), a name given in Yorkshire to the territorial divisions of the county, similar to what, in most of the other counties of England are called *hundreds*, and in the more northern counties, *wards*. The term has come down from Anglo-Saxon times, where it, in the first instance, signified the assemblies of each district held for the administration of justice and like purposes, at which each vassal attended armed, and 'touched' the spear of his overlord, in token of homage. From the assembly, the word

was transferred to signify the district within which it was convened.

WA'PITI (*Cervus Canadensis*), a species of deer, nearly allied to the stag, but considerably exceeding it in size, being 4½ feet in height at the shoulder. It is a native of North America, found as far south as Carolina, and as far north as 56° or 57° N. lat. It is yellowish brown on the upper parts; the sides gray; a pale yellowish patch on each buttock, bounded by a black line on the thigh; the neck, a mixture of red and black, with long, coarse, black

Wapiti (*Cervus Canadensis*).

hair falling down from it in front like a dewlap; a black mark at each angle of the mouth. The hair is crisp and hard, but there is a soft down beneath it. The antlers are large, much like those of the stag, but the first branch bends down almost over the face. The W. is called *Elk* and *Gray Moose* in some parts of America, although very different from the true elk, or moose deer. It is found chiefly in low grounds, or in parts of the forest adjacent to savannahs and marshes. Its flesh is coarse and dry. The hide makes excellent leather.

WAR between states or nations, or between parties in the same state (*civil war*), is analogous to club-law (Ger. *faustrecht*), or the law of the strongest, among the individuals of a community, which is the normal state of things where no legal or fixed rights are established, or where there is no authority to enforce them. The prevalence of war among nations is thus an indication of the imperfection, or the total want, of international law. If the sentiment of brotherhood were universally diffused, and a system of international morality established and generally accepted together with an organisation for putting it in force, we can conceive the necessity for war to cease. And although the full realisation of this state of things may never be attained, it is nevertheless the ideal goal to which all real progress tends. But it by no means follows that in the present condition of the world, while the sentiment of international justice is yet in embryo, peace at any price is to be preferred to war. When a community is in a state of anarchy, the individual man must take the law into his own hands, and defend his life and his rights with violence if need be; and nations in similar circumstances must do the same. The Balance of Power (q. v.), the shape in which the sentiment of political morality in Europe seemed at

one time trying to crystallise itself, has gone again apparently into chaos.

Wars are various in their occasions and objects, sometimes breaking out in consequence of disputes about territorial possessions or material interests; at other times, having reference to the establishment of some important point of civil or religious liberty. In all cases, the aim of each contending party is to weaken and overthrow the opposing party. At one time, the art of war was supposed to consist very much in wearing out the enemy by a slow process of exhaustion, and thus wars were much protracted; but more recently the greatest generals have adopted the method of rather endeavouring to strike sudden and terrible blows, by which the war is sooner brought to a termination; and this method, although it may often have been adopted without regard to considerations of humanity, is, in all probability, less productive of suffering to mankind than the other.

Amongst rude nations, wars are conducted by tumultuary hosts, suddenly congregated, and in general, either after defeat or victory, soon dispersed. But the wars of the more civilised and powerful nations have long been conducted by armies carefully trained and disciplined; and in the case of maritime powers, by means of fleets at sea as well as of armies on land. Preparation for war amongst such nations requires not only the forming and training of the army, but vast provision in many various ways of the means and *matériel* of war. Much science and skill are also applied to the conduct of military operations, and the principles upon which they ought to be conducted have been carefully investigated, and theories tested by an examination of the history of the most important campaigns. See STRATEGY, TACTICS.

In the progress of society, certain *usages of war* have come to be generally recognised. These, of course, have varied at different times, and in different parts of the world, according to the state of civilisation and the prevalent feelings of the time: they are also subject to modification from causes less general. But the changes which have taken place in them during the lapse of ages have been in general favourable to the interests of humanity. Prisoners of war are no longer put to death, nor are they reduced to slavery, as was once very frequently the case, but their treatment has become generally more and more mild and kind. It is a well-understood rule, however, that a prisoner of war obtaining his liberty by exchange or otherwise, with the condition of not serving again during a fixed period against the same power, forfeits his life if he is found so serving and is again taken prisoner. Amongst all civilised nations, quarter is granted in battle whenever it is sought; and there are certain usages universally prevalent with regard to the capitulation of fortified places, and of bodies of troops hopelessly hemmed in by superior forces, &c.

War-cries for mutual recognition and encouragement in battle have always been common, each rude nation or tribe having its own. The ancient war-cry of the English was *Saint George!* that of the Spaniards, *San Jago!* and that of the French, *Mountjoie Saint Denis!* In the feuds of the middle ages, each party, or the retainers of each noble family, had a distinctive war-cry. Sometimes the war-cry was the name of the family. Thus, in Scotland, the retainers of the noble Houses of Douglas and of Home rushed into battle with the cry of *A Douglas! a Douglas!* or *A Home! a Home!* The French armies under Napoleon were accustomed to charge with shouts of *Vive l'Empereur!*

The invention of gunpowder has effected great changes in the whole art of war; but the introduction of firearms has rendered battles less sanguinary

and ferocious than they previously were. Whilst firearms were yet unknown, warlike engines of various kinds were employed; but close combat was more general, and often more protracted, and the passions of the combatants had thus in ordinary battle more of that exasperation which fearfully characterises the storming of a town.

WARASDIN, a town of Austria, in the crown-land of Croatia, two miles from the right bank of the Drave, and about 40 miles north-north-east of Agram. It is to some extent fortified, is surrounded by straggling suburbs, and contains nine churches, a few convents, and a gymnasium. Silk-spinning is carried on; and stoneware, wine, and tobacco are manufactured. Pop. 9000.

WARBLER, a popular name often applied to all the birds of the family *Sylviadae* (q. v.), many of which, however, commonly receive other popular names, as the Blackcap, Nightingale, Hedge-sparrow, Red-breast, Redstart, Stonechat, Wheatear, Whitethroat, &c. (q. v.), while many receive the name Warbler with some adjunct. Several British species, commonly thus designated, belong to the genus *Salicaria*, others to the genus *Sylvia*. The species of the former genus have the tail rounded; in the latter, it is almost square or a little forked. The *Salicariae* are also inhabitants of moist situations, whence they are known as *Sedge Warblers* and *Reed Warblers*; the *Sylviae* are inhabitants of woods. Of the former genus is the **GRASSHOPPER W.** (*Salicaria locustella*), not unfrequent in many parts of England, and found also in the south of Scotland and in Ireland. It is found in most parts of the centre and south of Europe, at least during summer, being partially a bird of passage. It is of a greenish brown colour, the centres of the feathers dark brown, producing a spotted appearance; the lower parts pale brown. It is a shy bird, hiding itself in hedges and bushes, but very active often darting out like a mouse from

chin and throat white; the under parts buff colour.—The **REED W.** (*Salicaria arundinacea*) is found in summer in marshy situations in the south of England; it abounds in Holland and in many parts of Europe, and its range extends to the north of India. It is of a uniform pale brown, with a tinge of chestnut; the chin and throat white; the under parts pale buff colour. Its nest is remarkable; it is attached to the stems of three or four reeds, and

Nest of Reed Warbler.

formed by winding the branches of their panicles together with a little wool; and is conical and deep, so that the eggs or young may not be shaken out when the reeds are shaken by the wind.—The **WOOD W.**, also known as **WOOD WREN** (*Sylvia sylvicola*), is common in the wooded districts of England, in summer, particularly in old plantations of oak and beech. It is olive green, tinged with yellow, the wings brown, the primaries and secondaries edged with bright yellow, the tertials with a broader edge of yellowish white; the lower parts yellow and white.—The **WILLOW W.** (*Sylvia trochilus*) is very common in the south of England in summer, but more rare in northern parts of Britain. It frequents woods, shrubberies, thick hedgerows, and bushes; but builds its nest on the ground. It is of a dull olive-green colour, the wing and tail feathers dark brown, the wing-feathers edged with green; the under parts whitish, slightly tinged with yellow. The tail is slightly notched. There are other British species of more rare occurrence.—Numerous species of W. are found in North America, migratory birds, which spend the winter in more southern regions. Not a few of the same species are therefore reckoned among the birds of the West Indies. Some of the European species are in like manner found in Africa; and Asia has many species of W., among which some of the European species are included. Australia has many species of W., some of which are of very beautiful plumage.

WARBURTON, WILLIAM, a distinguished English divine, commonly known as Bishop Warburton, was born at Newark, in the county of Nottingham, on the 24th December 1698. He was the eldest son of George Warburton, an attorney of that place, who claimed descent from an old Cheshire family. Young W. received his education at the school of his native town, and afterwards at Oakham in Rutlandshire, which he left in the year 1714,

1, Sedge Warbler (*Salicaria phragmitis*); 2, Willow Warbler (*Sylvia trochilus*).

the bottom of the hedge, and receives its name from its chirping, grasshopper-like note.—The **SEDE W.** (*Salicaria phragmitis*) is the most common British species of *Salicaria*, and is generally found in thick patches of reeds or willows in marshes, or in other situations close to water, and where the aquatic herbage is thick and strong. It abounds on the marshy banks of the Thames. It is of a brown colour, exhibiting various shades, finely intermixed; the

returning home to pursue the profession of his father, who had died some years before. Having served the necessary apprenticeship, he practised as an attorney at Newark for some years, but with no distinguished success. His natural bent was towards literature; and he had all along expressed a desire to take orders in the Church of England. Finally, he quitted the legal profession with this object in view; and having gone through the necessary course of study, he was presented, by Sir Robert Sutton, in 1728, to the rectory of Brand-Broughton, in the diocese of Lincoln, where he remained for many years. After publishing some comparatively unimportant pieces, he issued, in 1736, a treatise, entitled *The Alliance between Church and State; or the Necessity and Equity of an Established Religion and a Test Law*. This work, which is still recognised as one of the most masterly statements of the subject from the point of view of the writer, drew great and immediate attention; and in January 1737—1738, it was followed by the first volume of the *opus magnum*, on which his fame as a theologian must mainly continue to rest. This celebrated work, *The Divine Legation of Moses, demonstrated on the Principles of a Religious Deist, from the Omission of the Doctrine of a Future State of Rewards and Punishments in the Jewish Dispensation*, though it encountered a storm of adverse criticism, to which the writer thought it necessary to reply in *A Vindication, &c.*, at once established the position of W. as one of the most potent intellects of the period; and though its main argument has since been extensively discredited as more or less 'precarious,' not the less the book, in virtue of its vast learning, its vigour, and originality, will always maintain its reputation, as one of the master-pieces of the great period of our English theology. In 1739, a new and revised edition of the first part of the work appeared. This was followed, in 1741, by the publication of the second part; and the third and concluding section, rather supplementary to the argument than essential to it, was only given to the world after the death of the writer.

Becoming involved in the controversy which followed the appearance of Pope's *Essay on Man*, W. undertook the defence of the poet, and, in 1739—1740, issued a series of seven letters, entitled *A Vindication of Mr Pope's Essay on Man, by the Author of the Divine Legation*. The poet was much gratified; and between him and his vindicator a warm friendship was the result, which only terminated with the death of Pope, in 1744. He died, bequeathing to W. one-half of his library, and such profit as might accrue from any edition of his works published after his death. To Pope, W. was indebted for opportunities of cultivating the friendship of some of the most distinguished men of the time—among others, of the well-known Ralph Allen, of Prior Park, near Bath, to whose niece, Miss Gertrude Tucker, he was married in 1745.

Though W.'s important services to literature and religion were admitted, they did not for a long time bring him any very great recognition in the way of substantial preferment. On the appearance of *The Divine Legation*, indeed, he had been appointed Chaplain to the Prince of Wales; and in 1746, nearly ten years later, the Society of Lincoln's Inn unanimously elected him to be their preacher. In 1757, he was promoted to the deanery of Bristol; and finally, in 1760, Mr Pitt, afterwards Earl of Chatham, bestowed on him the bishopric of Gloucester, declaring that 'nothing of a private nature, since he had been in office, had given him so much pleasure' as this exercise of his patronage. In the later years of his life, his mind became seriously impaired; and he was utterly prostrated

by the loss of his only son, whom he did not long survive. He died on 7th June 1779.

W. was a keen polemic, and deeply engaged in all the intellectual warfare of his time. In nearly everything he wrote, there is the impress of a vigorous and fertile mind, with an arrogance of tone, which tends, in his treatment of adversaries, to degenerate into truculence and scurrility. In addition to those already mentioned, it seems sufficient to give the titles of a few of his more notable performances. In 1750, appeared his *Julian, or a Discourse concerning the Earthquake and Fiery Eruption which defeated that Emperor's Attempt to rebuild the Temple at Jerusalem, apropos of Dr Middleton's Inquiry concerning the Miraculous Powers of the Christian Church*. Shortly after came two volumes entitled *The Principles of Natural and Revealed Religion occasionally Opened and Explained*; and in 1755, *A View of Bolingbroke's Philosophy, in a Series of Letters to a Friend*, which was held to be much the ablest of all the answers to Bolingbroke which appeared. In 1757, he attacked Hume, in a publication entitled *Remarks on Mr David Hume's Natural History of Religion, by a Gentleman of Cambridge, in a Letter to the Rev. Dr Warburton*. The blind deceived no one; and if we may estimate the success of the attack by the annoyance it gave the philosopher, his allusions to 'that low fellow Warburton' may be held to indicate success. In 1747, he went somewhat out of his way to issue an edition of Shakspeare, with notes critical and emendatory, which last, though ingenious, and occasionally happy, did not greatly add to his reputation. A complete and splendid edition of his works was published in 1788, at the expense of his widow, by his friend, Bishop Hurd, who prefaced it with a biography.

WARD, EDWARD MATTHEW, R.A., an eminent painter of the present day, was born in the year 1816, in London. He early displayed a taste for art, and was educated in a way to develop it. In 1834, he was sent to study at the Royal Academy; and two years after, he went to Rome, where he remained for some time, gaining, in 1838, a silver medal, given by the Academy of St Luke. He returned to England in 1839, making on the way a short visit to Munich, where he had lessons in fresco-painting from the celebrated Cornelius. After his return, he annually exhibited pictures at the Royal Academy, though for some years without any very decisive recognition. In 1843, he competed unsuccessfully for the decoration of Westminster Hall and the Houses of Parliament, his large cartoon specimen, 'Boadicea,' being generally adjudged a failure. In the same year, however, he made a very 'palpable hit' by his picture, familiar to every one as engraved, 'Dr Johnson perusing the Manuscript of the Vicar of Wakefield.' His steady progress thenceforward, in the estimation of connoisseurs and the public, is sufficiently marked by the fact, that in 1853, having previously, as we noted above, failed in the public competition for the work at Westminster, he was solicited by the Fine Arts Commissioners to aid in this national undertaking. Of the eight cartoons which he engaged himself to furnish, several have been completed. The merit of these is unquestioned; and one of them in particular, 'The Last Sleep of Argyll,' is ranked by competent judges as one of the most masterly works in this kind which our country has as yet produced. In further recognition of his merits, Mr W. was, in 1847, elected an Associate of the Royal Academy; and in 1855, he attained the full honour of Academician. Of the works of an artist so well known, it would be idle to attempt a catalogue. A few of the more notable are: 'The Fall of Clarendon,' 'Interview between Charles II. and Nell

Gwyn,' 'The Royal Family of France in the Prison of the Temple,' and 'Charlotte Corday led to Execution.' In technical execution, Mr W. must be admitted a master; if he fails a little commonly, on the side of penetrative power and genuine imaginative realisation, it would be unfair to say that his failure is conspicuous, as compared with that of others of his brethren, who yet very well contrive in these times to pass for poetic artists.—His wife, MRS HENRIETTA WARD, is also favourably known as a painter, and as the grand-daughter of James Ward, R.A., in his day something of an art-celebrity, though now a little out of date.

WARDEN, an officer appointed for the naval or military protection of some particular district of country. In order to keep the districts of England adjoining to Scotland and Wales in an attitude of defence, great officers, called Lords Wardens of the marches, were appointed, to whom the duty of protecting the frontier was committed. From this source originated the name *ward*, applied to the subdivisions of the counties of Cumberland, Westmoreland, and Durham—a term afterwards extended to divisions of a city, town, or burgh adopted for municipal purposes. The custodian of Dover Castle was created by William the Conqueror warden of the Cinque Ports (q. v.), and guardian of the adjacent coast; an office comprising extensive jurisdiction, civil, naval, and military, the greater part of which was taken away by 18 and 19 Vict. c. 48.—As to the Lord Warden of the Stannaries, see STANNARIES.

WAR DEPARTMENT, the entire administration of the military affairs of the nation. It includes the purely military command under the COMMANDER-IN-CHIEF, and the civil administration under the Secretary of State for War. This latter includes the manufacture of warlike stores, and their custody; the formation of defensive works; the paying, feeding, punishing, curing, arming, carrying, &c. of the army. The National Surveys form also a part of this department. The whole department is controlled by the War Office.

WARDHOLDING, the military tenure of land in Scotland under the feudal system, by which the vassal was bound to serve the superior in war whenever called on to do so. As the military duties of the vassal could not be performed when he was under age, the superior had a right both to the guardianship of his person and to the possession of his fee during his minority. An arrangement, however, was frequently made by which this right was commuted into an annual payment, in which case the fee was said to be held in *Taxed Ward*. When an unmarried vassal succeeded, the superior was entitled to a sum proportionate to the value of the estate, called the *Avail of Marriage*; and a larger sum, called the *Double Avail of Marriage*, was due when the superior named a wife for his vassal, and the vassal, rejecting her, married another woman. If a vassal alienated his lands or the larger portion of them without consent of his superior, the fee fell to the superior by what was called the casualty of *Recognition*, which was a check on vassals impoverishing themselves to such an extent as would render them unfit to perform feudal services. Wardholding was abolished by 20 Geo. II. c. 50, as a system hazardous to the public tranquillity, such fees as were held ward of the crown being converted into *Blanch* (q. v.) holdings, and those held of subjects becoming feu-holdings, a yearly sum being made payable to the superior, as a recompense for the casualties which were done away with.

WARDIAN CASES, close glass cases placed upon a trough containing soil, and accurately fitted to it, intended for the growth of plants in the

windows of apartments. Remarkable success has attended the use of them even in the smoky atmosphere of the largest towns. Ferns and other plants may now be seen in great beauty and luxuriance in

Wardian Case.

these cases in the windows of houses in London and in all the cities of Britain. They are especially adapted to those plants which require an atmosphere more moist than that of an inhabited apartment can ordinarily be. They derive their name from the inventor, Mr W. B. Ward of London. To the success attending them, the invention and frequent use of *vivaria* for marine animals is with great probability attributed.

WARDLAW, RALPH, D.D., the most celebrated preacher and theologian in the roll of Scotch Independents, was a Seceder by extraction, and studied in connection with the Associate Secession Church. Before he had completed his curriculum, however, he had convinced himself that congregational independency was the scriptural system of church government. In 1800, he began to preach, and after some time settled in Glasgow as pastor of an Independent church. In 1811, he was appointed Professor of Theology to the Congregational body in Scotland, in conjunction with the Rev. Greville Ewing; an office he retained, along with his pastorate, to the period of his death, which happened on the 17th December 1853. W.'s life was a very laborious and earnest one. Besides discharging faithfully and ably the duties of the pulpit and the professor's chair, he was a voluminous author, often involved in theological controversy, and a prominent actor in the public religious and philanthropical movements of the day. His intellect was acute, his understanding sound, and his style remarkable for its perspicacity, vigour, and grace. The most important of W.'s works are: *Discourses on the Socinian Controversy* (1813); *Lectures on Ecclesiastes* (2 vols. 1821); *Essays on Assurance of Faith, and on the Extent of the Atonement and Universal Pardon* (1830); *Discourses on the Sabbath* (1832); *Christian Ethics* (1833); *Discourses on the Nature and Extent of the Atonement of Christ* (1843); *The Life of Joseph and the Last Years of Jacob* (1845); *Congregational Independency* (1848); *On Miracles* (1852).—See *Life and Correspondence of Ralph Wardlaw*, by Dr Alexander (1856).

WARDÖEHUUS, a seaport in Norway, at the east extremity of Fiumark, stands on the island Wardöe or Vardöe, and is protected by a fort, the most northerly fortification on the globe, being in lat. 70° 22'. The inhabitants, inclusive of the garrison of 24 men, number only 120. Not even potatoes or barley comes to maturity; and the few

cows that are kept have sometimes to be fed on herrings.

WARDSHIP, in English Feudal Law, was the guardianship which the feudal lord had of the land of his vassal while the latter was an infant or minor. Until the majority of the infant, the lord, out of the profits, provided a fit person to render the services incumbent on the vassal. See **TENURE**, **WARDHOLDING**.

WARE, a small market-town in Herts, 2½ miles north-east of Hertford. Malting, for which there are several establishments, most of them engaged in supplying the London breweries, is the principal employment. The springs of the New River, which supplies London with water, are in the vicinity. In one of the inns of the town, is still to be seen the famous Bed of Ware, for a notice of which, see **BED**. Pop. (1861) 5002.

WAREHAM, an exceedingly ancient though small town of Dorsetshire, stands between the rivers Piddle and Frome, 14 miles nearly due east from Dorchester. It was a British town, and afterwards a Roman station, and is surrounded by a British vallum or rampart of earth, which, although extremely ancient, is still about 30 feet high, and is perfect on three sides. Stockings, shirt-buttons, and straw-plait are manufactured. The borough, comprising the parishes of Holy Trinity, Lady Saint Mary, Saint Martin Arne, Bere Regis, Corfe Castle, and parts of the parishes of East Stoke and Morden, sends a member to parliament. Pop. (1861) 6694.

WAREHOUSING SYSTEM is a plan for lessening the pressure of excise or customs duties by postponing payment of them until the goods they are laid on pass to the consumer, or, at all events, to the retail dealer. A merchant who might import a thousand pounds worth of wine or tobacco, if he only paid duty on it by instalments as it went out to the dealer, would be quite unable to import so much if he had to pay somewhere from one to five thousand pounds of duty on its arrival. The system of bonded warehouses was hence adopted. The taxable commodity thus came to be locked up in a government warehouse, and the duty to be paid on its removal, along with a proportional fee or rent for the custody of the article, or its accommodation in government premises. Bonding in this manner was part of the scheme of Sir Robert Walpole in 1733, generally known as the Excise Scheme, which was defeated from its unpopularity. The system was first authorised by an act of George III. in 1802. When the customs laws were from time to time consolidated, the Warehousing Act formed a portion of the consolidation. In the consolidation of 1846, there was a separate 'Act for the Warehousing of Goods.' In the latest consolidation of 1853, the warehousing system is embodied in clauses 41 to 113 inclusive of the general 'Customs Consolidation Act' (16 and 17 Vict. c. 107). This process, by which the crown holds in custody the goods of private persons, has produced some curious effects on mercantile law and trading practices. When transactions have taken place about bonded goods, should they be injured or destroyed, it may come to be a question of nice adjustment who is to bear the loss, seeing there is not possession to shew ownership; and still nicer questions sometimes arise as to whether such goods are or are not part of a bankrupt estate. There is a difficulty in securing money upon goods without transferring their absolute possession, as in the case of pledging or pawning. The warehousing system, however, by retaining the goods for the owner, whoever he may be, has created a complete system of paper-money in the

transference of the title-deeds, as they may be called, of such goods—the dock-warrants or other documents—the possession of which is equivalent to possession of the goods.

WARM-BLOODED ANIMALS. Under this title are included those vertebrates which possess a four-chambered heart and spongy lungs; the heart and lungs being so arranged that the whole of the venous or impure blood is propelled over the large but closely-packed capillary area of the lungs, by successive contractions of a special ventricle, receiving it from a distinct auricle (these being called the right or pulmonary ventricle and auricle), while the blood thus purified by the action of the air in the lungs is conveyed to another auricle, and propelled over the whole system by a second distinct ventricle (these being known as the left or somatic auricle and ventricle). The only animals which exhibit these structural peculiarities are mammals and birds. In man and in the ox, the mean temperature of the interior of the body is 100°; in the mouse, it is 99°; while in the whale it is 103°. In birds, it ranges, in different species, from 106° to 112°. The warm-blooded animals present, however, gradations of their heat-making power. In the hibernating animals, there is commonly a loss of heat, of from 10° to 20°, during their winter-sleep; and in the bat, the temperature falls to 40°. In the cold-blooded animals, the fishes, amphibians, and reptiles, the temperature of the blood rarely exceeds that of the surrounding medium. For the general characters of the warm-blooded animals, the reader is referred to the articles **BIRDS** and **MAMMALIA**.

WARMING AND VENTILATION. **WARMING**.—A certain temperature, constant within narrow limits, is essential for the life of warm-blooded animals, and the heat by which this temperature is maintained is produced by the vital actions of the body itself. See **ANIMAL HEAT**, **TEMPERATURE OF THE BODY**. In the case of man, however, at least in ordinary climates, and in the civilised condition, the heat of the body, if allowed freely to escape, would be dissipated faster than it is produced; and hence arises the necessity of clothing, houses, and other means of retarding its escape. To allow the body to continue depressed in temperature beyond the natural state, instead of hardening, infallibly weakens its vitality, and sows the seeds of disease; and that this error is committed on a vast scale, in Britain more especially, is apparent enough. The Reports of the Registrar-general shew that, exactly as the thermometer sinks, the rate of mortality rises and certain diseases of the most fatal kind become more prevalent; the vitality, in short, of the community decreases as the warmth of the atmosphere decreases. Could this be, if the means taken to arrest the waste of heat from our bodies, or to supplement it, were not, for the majority of men and women, insufficient, or injudiciously managed? This is a matter of literally 'vital' moment to one and all. The economy of heat is a primary element in the art of living in health and comfort; and 'no knowledge of common things' that we can think of can surpass in importance a right understanding of the principles and facts on which that art rests.

Where fuel is scarce the resource against the cold of winter is thick clothing indoors as well as out. This is said to be the regular practice in China; and even in the south of Europe, fires are dispensed with in weather when we should think them absolutely necessary, and additional wrappings are considered as appropriate while sitting in the house, as in the open air. But wherever fuel can be had, it is always preferred to wear

WARMING AND VENTILATION.

within doors much the same clothing in winter as in summer, and to keep the apartments nearly at summer temperature by artificial heat. It is this special branch of the subject, viz., the artificial warming of apartments, that we are at present to consider; and in doing so, we presume the reader to be acquainted with the more general facts regarding the generation of heat by combustion, and its diffusion, as stated in the articles COMBUSTION, FLAME, FUEL, HEAT.

The great aim, it may be premised, in all plans of warming is, as it is expressed by Dr Arnott, 'to obtain everywhere on earth at will, the temperature most congenial to the human constitution, and air as pure as blows on a hill-top.' The obtaining of the desired temperature would be comparatively easy by itself; the difficulty lies in combining warmth with pure air. Warming and ventilation are thus in some degree antagonistic operations, and are therefore best treated in one article. The various plans of warming hitherto tried may be classed under the four heads—The Open Fire, Stoves, Gas, Steam and Hot Water.

The Open Fire.—The first application of artificial warmth consisted, most likely, in lighting a fire of dried sticks and leaves in a cave, or other natural shelter. When tents or wigwags came to be erected, the fire would be lighted on the middle of the floor, with perhaps a hole in the roof for the smoke to escape by. This primitive arrangement may still be seen in some of the cabins of Ireland and the Scottish Highlands. The Romans warmed their apartments chiefly by portable stoves or chafing-dishes, without any regular exit for the smoke and fumes; and a brasier of charcoal is still the chief means of heating sitting-rooms in Spain and Italy, which are in general without chimneys. The Chimney (q. v.) is a modern invention.

The open coal-fire glowing in a grate, which is the prevalent mode of warming dwelling-houses in Britain, has an air of cheerfulness and comfort, and a power of concentrating the whole family in one social circle, that make it almost an object of worship; but it is not without serious drawbacks, the most serious of which is the waste of fuel it occasions. About one-half of the heat produced by a common fire ascends with the smoke—the black part of the smoke itself being an unconsumed part of the fuel—while about a fourth of the heat which is radiated into the apartment is, in ordinary circumstances, carried into the chimney between the fire and the mantel-piece, and thus lost. It is calculated by Dr Arnott, that only about one-eighth part of the heat-producing power of the fuel used in common fires is realised, all the rest being dissipated into the surrounding atmosphere. A common fire gives also a partial kind of warmth, heating the side of the body next to it, but leaving the rest cold; and it produces draughts into our rooms which are anything but safe or agreeable. Notwithstanding these and other acknowledged evils, the open fire continues to hold its place, partly perhaps from prejudice, partly from real points of superiority over other methods as yet practised; and the object of late has been, not so much to do it away, as to improve it.

Grates.—One improvement consists in diminishing the quantity of metal in immediate contact with the fuel, and forming the back and sides of the grate of fire-bricks. The bricks act like clothing, and keep in the heat of the coals, thus rendering the combustion more complete, and the fire far hotter; while iron, being a good conductor, runs away with the heat as fast as it is generated, and passes it into the wall, making the coals that touch it dull and black. The same quantity of fuel,

therefore, burned in a brick-lined grate, not only produces more heat, but throws a greater proportion of that heat out into the room, and less up the fire and through the wall, than when it is surrounded by a mass of iron; for radiation depends more upon the intensity of heat than upon its quantity.

Another point deserving attention is the shape given to the chimney-mouth, or recess above the grate. When the sides are square with the back, none of the heat falling on them is given out again into the room. With a view, therefore, to throw out the heat better, the sides, or *covings*, as they are called, are inclined to the back at an angle of about 130° ; and sometimes they are made curved and of polished metal, in order that they may reflect the heat without absorbing it. It is questionable if simple brick slabs, placed at the proper angle, do not throw out more heat than the most splendid polished metal plates; for though the bricks do not reflect the rays of the fire, they become heated themselves, and then radiate their heat into the room. Plates of rough metal absorb the heat that falls upon them as the brick does; but being good conductors, the heat passes through them into the wall, and thus they never become hot enough to radiate sensibly.

Much also depends upon the shape of the fire-box, or grate itself. To see the importance of this, it is necessary to attend carefully to the exact way in which an open fire heats a room. It does so almost entirely by the rays of heat that it throws out; and these rays do not warm the air directly; they pass through it like light through glass, just as the hottest rays of the sun pass through the upper atmosphere, leaving it cold enough to freeze mercury. It is only when the rays of the fire fall on the floor, furniture, and walls of the room, that they give out their heat; and it is by coming in contact with these solid heated bodies that the air is gradually warmed. We may thus see the necessity of having a fire lighted and burning brightly for a considerable time before the hour when the apartment is expected to be comfortable.

The law that radiant heat neither affects nor is affected by the surrounding air, also explains the fact that an apartment may feel very cold, though the air in it be at high summer heat. A church or other massive stone building in frosty weather may be filled with artificially-heated air and yet retain its chilling effect for many hours. The warmth of the living body is lost in two ways: the film of colder air that touches it receives part of its heat by conduction, and rising up makes room for another film to do the same; a moderately heated body in cooling, is robbed of about half its heat in this way. The other half is given off in rays, which pass through the air, and impinge upon the objects around. These objects are radiating back heat in return; but their temperature being low, the return is small, and the warmer body is colder by the difference. Hence we are chilled by a cold wall or a cold window without touching it, and though the air between us and it may be at 70° .—To return to the shape of the grate.

The chief object is to present as large a surface as possible of glowing fire to the front. With this view, the grate is made long and deep, in proportion to its width from front to back. This principle, however, is carried too far in many grates. The stratum of fuel is too thin to burn perfectly, especially in the narrow angles at the sides, where the coals seldom get to a red heat, and are only warm enough to distil away in smoke. Such fires are constantly going out, and are further from being economical than a square box.

The practice recently come into vogue of placing

grates almost on a level with the floor, is also a mistake. The floor and the lower part of the person receive no share of the radiant heat.

The chimney-throat, instead of a gulf drawing in a constant wide current of the warm air of the room, and causing draughts from windows and doors towards the fireplace, should just be sufficient to admit the burned gases and smoke that, come directly from the fire, and no more. See CHIMNEY. This is the object of the movable plate in what are called *register-grates*.

It would be endless to attempt to enumerate the various forms of grate constructed, with more or less success, on the above principles. We shall content ourselves with a notice of the recent invention of Dr Arnott, to whom the subject of warming apartments is more indebted than to any individual since the days of Count Rumford. It comes nearer to the idea of perfection in an open fireplace than any previous contrivance. Its peculiar advantages will be understood from the following description :

Arnott's Smokeless Grate.—*ab, ef* (fig. 1), represent the front bars of a grate in a chimney of the usual construction, *rsou*. The grate has no bottom, and

Fig. 1.

below it is an iron box, open only at top, into which the charge of coal for the day—from twenty to thirty pounds—is put. Any kind of coke or coal may be used. To light the fire, the usual quantity of wood is laid on the surface of the fresh coal at *ef*, and a thickness of three or four inches of cinders or coked coal, left from the fire of the preceding day, is laid over all. 'The wood being then lighted, very rapidly ignites the cinder above, and at the same time the pitchy vapour from the fresh coal below, rises through the wood-flame and cinders, and becomes heated sufficiently itself to become flame, and so to augment the blaze. When the cinder is once fairly ignited, all the bitumen rising through it afterwards burns, and the fire remains smokeless.'

As there is no supply of air but through the bars in front, the box being close underneath, the fire must be gradually raised up as the combustion goes on; and this is effected by having a false bottom, *rs*, in the box, which can be moved like a piston by means of a rod. The rod has notches in it, and, by

means of the poker used as a lever, can be raised up and then retained at any height by a ratchet-catch. When the piston comes level with the bottom bar of the grate, the coals may be replenished while the fire is burning, by pushing in a flat shovel over the piston, so as to form a temporary bottom to the grate, and support the fire, while the piston is allowed to descend to the bottom. The shovel is then raised up a little in front, or a part of the upper edge of the box is made to fold down, and fresh coals are shot into the box; on which the shovel is withdrawn, and the combustion goes on as before.

'A remarkable and very valuable quality of this fire is, its tenacity of life, so to speak, or its little tendency to be extinguished.' Even after it sinks below the level of the box, it does not go out, but continues to smoulder slowly for a whole day or night, and is ready to burn up actively when the piston is raised.

Another peculiarity of the Arnott grate is the means taken to diminish the proportion of the heat usually carried up the chimney. Of the thick column of smoke that issues from a common chimney-can, only a small fraction is true smoke or burned air; the rest consists of the warmest air of the room, which becomes mixed with the true smoke in the large space usually left between the top of the fire and the throat of the chimney. 'The whole of the air so contaminated, and which may be in volume twenty, fifty, or even a hundred times greater than that of the true smoke, or burned air, is then all called smoke, and must all be allowed to ascend away from the room, that none of the true smoke may remain. It is evident, then, that if a cover or hood of metal be placed over a fire, as represented by the letters *yab* in the diagram—or if, which is better, the space over the fire be equally contracted by brickwork, so as to prevent the diffusion of the true smoke, or the entrance of pure air from around to mix with it, except just what is necessary to burn the inflammable gases which rise with the true smoke—there will be a great economy. This is done in the new fireplace, with a saving of from one-third to one-half of the fuel required to maintain a desired temperature. In a room, the three dimensions of which are fifteen feet, thirteen feet and a half, and twelve feet, with two large windows, the coal burned to maintain a temperature of 65° in cold winter days has been eighteen pounds for nineteen hours, or less than a pound per hour.'—*Arnott's Warming and Ventilation*.

The hood is furnished with a throttle-valve or damper, *t*, having an external index, shewing its position, so as to give complete control over the current. The provision made for ventilation in this fireplace is considered further on.

Even in this, perhaps the most economical form of open fire yet contrived, there is still great waste of the heat actually produced by the combustion. To say nothing of what passes by conduction from the fire itself into the wall, and is mostly lost; the quantity carried off in combination with the hot gases, though no more air is allowed to enter than is necessary for complete combustion, is still great. It deserves being noticed, that the proportion thus carried off is greatest in the case of fuel that burns with flame. Experiment shews that a fire of wood radiates one-quarter of its heat, the rest flying up; while the radiation from wood-charcoal is one-half of the whole heat produced. Every one has felt that a *blazing* fire has far less warming effect than a glowing one. Not that flame has not intense heat in it—more intense even than a glowing fire; but it gives it out only by contact, and not by radiation. It thus appears that any mode of heating that

depends upon direct radiation, as the open fireplace chiefly does, necessarily involves great waste of fuel. This can be avoided only by applying the heat on a different principle, which consists in first making the fire heat certain apparatus with considerable surface, which then, by radiation and contact with the air of the apartment, diffuses its heat throughout it. This is the principle of the other methods of warming, which we now proceed to describe. The consideration of methods that combine the two principles, will come most conveniently last.

Warming by Stoves.—A close stove is simply an enclosure of metal, brick, or earthenware, which is heated by burning a fire within it, and then gives out its heat to the air by contact, and to surrounding objects by radiation. The simplest, and, so far as mere temperature is concerned, the most effective and economical of all warming arrangements, is what is called the Dutch stove; which is simply a hollow cylinder or other form of iron standing on the floor, close at top, and having bars near the bottom on which the fire rests. The door by which the coals are put in being kept shut, the air for combustion enters below the grate; and a pipe, issuing from near the top, carries the smoke into a flue in the wall. If this pipe is made long enough, by giving it, if necessary, one or more bends, the heated gases from the fire may be made to give out nearly all their heat into the metal before they enter the wall; and thus the whole heat of the combustion remains in the room.

The great objection to this form of stove is, that the metal is apt to become overheated, which not only gives rise to accidents, but has a hurtful effect upon the air. The exact nature of the change that highly heated metal produces upon air is not very well understood. It cannot be said to burn it, in the proper sense of the word, for none of its oxygen is abstracted, but it gives it a peculiar odour, which is both unpleasant and unwholesome. This is thought to arise in some measure at least from the hot iron burning the particles of dust that light on it, which particles consist of organic matter, such as wool, wood, &c.

Part at least of the unwholesomeness of air so heated arises from its excessive dryness; it parches and withers everything it touches, like the African simoom. It must not, however, be supposed that this is peculiar to air heated by contact with metal; *air suddenly heated is always unwholesomely dry.* This is an important point in regard to the subject of warming, and requires consideration. A cubic foot of air, say at 32°, can contain a certain quantity of moisture and no more; but if heated to 80°, it is capable of containing *five* times as much, and has thus become *thirsty*, and drinks up moisture from everything that contains any. The heating of air, therefore, does not dry it, in the sense of taking moisture from it, it only renders it greedier of more; and this is equally true whether it is heated by a stove or an open fire. The chief difference is, that in the latter case the warming is more gradual, and no part of the air becomes very highly heated; while the air that touches a metal plate near redness is all at once rendered intensely thirsty, and before its fierceness is tempered by thoroughly mixing with the rest of the atmosphere of the room, must be highly pernicious. But whenever the temperature within doors is much higher than without, the air is in a too thirsty state, and parches the skin and lungs, unless means be taken to supply the necessary moisture. *An evaporating pan or other contrivance is an essential part of warming apparatus;* it is specially necessary to attend to this during east

winds, which are generally too dry even at their natural temperature.

All improvements on this simple and rude form of stove aim at avoiding a high heat in the warming surface, and this chiefly by lining the fire-box with brick, and enclosing it in several casings, so as to enlarge the heated surface. A general notion of these contrivances may be got from the annexed cut (fig. 2), representing the kind of stove called a *cockle*.

The fire is burned in a small furnace within the inner case, and the air is warmed by circulating between the inner and outer cases. When placed in the apartment or hall to be warmed, the outer casing has perforations about the top for the issue of the warm air. For heating churches and similar buildings, the stove is placed in a separate furnace-room, and the warm air is conveyed to the different parts of the building in pipes or flues, while fresh air is drawn to the stove through a channel or culvert leading from outside the building to the openings in the outer casing, where the arrows are seen entering.

Fig. 2.

The stove invented by Dr Arnott is upon the same principle of an extensive and moderately warm heating surface. Under a sense of professional honour, Dr Arnott did not take out a patent for his stove; it was therefore made by many furnishing ironmongers in the metropolis and elsewhere, some of whom took out patents for what they considered as improvements upon it. No fewer than twelve patents were taken out in one year for modifications of this stove, *all of which Dr Arnott considered to be upon false principles.* The consequence has been, that many Arnott stoves, which had been introduced into houses, have been given up on account of the inconvenience felt from the species of heat which they generated. It is also, however, to be observed that the stove, made even upon the most approved principles, requires certain adjuncts and conditions in order to operate healthfully and agreeably.

The accompanying figure represents the Arnott stove in the most improved form given to it by the

Fig. 3.

inventor. We give the description in his own words. 'The complete self-regulating stove may indeed be considered as a close stove, with an external case, and certain additions and modifications now to be described. The dotted lines and

small letters mark the internal stove, and the entire lines, the external case or covering. The letters ABCD mark the external case, which prevents the intense heat of the inner stove, *abcd*, from damaging the air of the room. F is the regulating-valve, for admitting the air to feed the fire. It may be placed near the ashpit door, or wherever more convenient. The letters *ff* mark the fire-brick lining of the fire-box or grate, which prevents such cooling of the ignited mass as might interfere with the steady combustion. H is a hopper, or receptacle with open mouth below, suspended above the fire like a bell, to hold a sufficient charge of coal for 24 hours or more, which coal always falls down of itself, as that below it in the fire-box is consumed. The hopper may at any time be refilled with coal from above, through the lid, *k*, of the hopper, and the other lid, *K*, of the outer case. These lids are rendered nearly air-tight by sand-joints; that is, by their outer edges or circumference being turned down, and made to dip into grooves filled with sand, as at *e*, *e*. The burned air or smoke from the fire, *M*, rises up in the space between the hopper and the inner stove-case, to pass away by the internal flue, *z*, into the other flue, *X*, of the outer case. L is the ashpit under the fire-bars. G is the ashpit door, which must be carefully fitted to shut in an air-tight manner, by grinding its face or otherwise. M is the coal intensely ignited below where the fresh air maintains combustion, but colder gradually as it is further up. Only the coal in the fire-grate below, where the fresh air has access to it through the fire-bars, can be in a state of active combustion.' The self-regulating valve above mentioned is an ingenious contrivance by which the passage for the air is rendered narrower according to the force of the draught. Dr Arnott describes various other plans of effecting the self-regulation of the combustion.

A drawer inserted into the heated chamber of the stove would serve for cooking meat, and a pot for boiling might be placed upon the fire-box; it is therefore, as the inventor remarks, peculiarly the *poor man's* stove. Or, by making the space between the two casings water-tight, a *water-stove* is produced, which, besides securing a regulated heat, offers many other conveniences.

In Russia, many parts of Germany, and other northern countries of Europe, the stoves are usually built of brick, covered with porcelain. They are of the size of a large and very high chest of drawers, and usually stand in a corner of the room. The fire is burned in a furnace near the bottom, and the heated smoke is made repeatedly to traverse the structure from side to side, along a winding passage, before it reaches the top, where a pipe conveys it, now comparatively cold, into a flue in the wall. The heated mass of brick continues to warm the room long after the fuel is burned. It is generally sufficient to warm the stove once a day. The same quantity of wood burned in an open grate would be consumed in an hour, and would hardly be felt.

Open-fire Stoves.—As a specimen of the numerous plans for combining the advantages of the stove and the open fire, we may take Sylvester's stove or grate, which is thus described in Ronalds and Richardson's *Technology*: 'The fuel is placed upon a grate, the bars of which are even with the floor of the room. The sides and top of these stoves are constructed of double casings of iron, and in the sides a series of vertical plates, parallel with the front facing, are included in the interior, which collect, by conduction, a great portion of the heat generated from the fire—the mass of metal of which these are composed being so proportioned to the fuel consumed, that the whole can never rise above

the temperature of 212° F. under any circumstances. The sides and top of the stove are thus converted into a hot chamber, offering an extensive surface of heated metal; at the bottom, by an opening in the ornamental part, the air is allowed to enter, and rises as it becomes warmed, traversing in its ascent the different compartments formed by the hot parallel plates, and is allowed to escape at the top by some similar opening into the room.' The Sylvester stove can either be placed in an ordinary chimney recess, or be made to stand ornamentally forward into the room. The feeding-draught may be either taken directly from the apartment, or brought by flues from the outside of the building.

The idea of having an air-chamber behind and around the fireplace, from which warm air would issue into the room, thus saving part at least of the vast amount of heat that is lost by passing through the wall, is not new, having been put in practice by the Cardinal Polignac in the beginning of last century. But the way to carry the principle out to the full would be to have the open fireplace in a pier of masonry standing isolated from the wall, like a German porcelain stove. A very small fire would keep the whole mass mildly heated. The pier could receive any shape, so as to give it architectural effect; and it might either terminate in the room—the smoke, after parting with most of its heat, being conducted by a pipe into the wall—or it might be continued into the story above, where its heat would still be sufficient to warm a bedroom. An Arnott smokeless grate, set in the pedestal of an ornamental column, which might either stand in front of the wall or in a niche in its depth, might be made the *beau-ideal* of comfort, economy, and elegance.

Warming by Gas.—A prejudice arose against gas as a medium of heat, from the first attempts to employ it being made in an unskilful way. But when care is taken to carry off the products of combustion by a pipe, and to prevent overheating, gas-stoves will be found economical and pleasant, and capable of being used in situations where a common stove is inadmissible.

In stoves, gas should always be burned with the Bunsen burner, which is generally employed by chemists when they make use of gas for heating purposes. It consists of a small brass cylinder, or chimney, set over the gas-jet, like the glass of an argand lamp, with openings near the bottom to allow air to enter. The gas being admitted into this before lighting, mixes with the air, and when lighted at the top, which is usually covered with wire-gauze or perforated metal, burns with a pale-blue flame. The most complete combustion and the greatest heat are obtained in this way. Smoke, properly so called, there is none. Still, it must not be forgot that there is burned air—a cubic foot of carbonic acid, besides a quantity of watery vapour, for every cubic foot of gas used; and therefore, even with the Bunsen burner, these gaseous products should, wherever it is possible, be conducted away.

A pleasant and very serviceable gas-stove might be constructed by making the casing double, to contain water. It has been ascertained that a gallon of water may be brought to the boiling-point in 20 minutes by burning 4 cubic feet of gas, which, at 4s. 6d. per 1000 feet, costs less than a farthing. The cost of doing the same by a newly-lighted coal-fire is more than threefold.

Steam and Hot Water.—The immediate warming agent in these two methods is the same as in Arnott's and other low-temperature stoves—viz., an extensive metallic surface moderately heated; but instead of heating these surfaces by direct contact with the fire, the heat is first communicated to

water or steam, and thence to the metal of a system of pipes. This affords great facility in distributing the heat at will over all parts of a building; and these methods are peculiarly adapted to factories, workshops, and other large establishments. Other advantages are—freedom from dust, and from all risk of overheating and ignition.

Steam.—Steam-warming is generally adopted in establishments where steam-power is used, as the same boiler and furnace serve both purposes. When steam enters a cold vessel, it is condensed into water, and at the same time gives out its latent heat till the vessel is raised to 212°, when the condensation ceases. The condensing vessel is usually a cast-iron pipe placed round the wall of the apartment near the floor. In admitting fresh air into the room it may be made to pass over this pipe, and thus be warmed. The steam is conducted from the boiler by a smaller tube, which may be covered with list or other material, to prevent all condensation by the way; and the admission of the steam is regulated by a cock within the apartment, means being provided for allowing the air to escape. Where a pipe cannot be laid round the room, a coil of pipe may be formed, or the steam may be admitted into a large vessel or into a hollow statue, forming a steam-stove. Allowance must be made for the expansion of the tubes by heat; and they are so arranged that the condensed water is conveyed back to the boiler. One round of iron pipe, of four inches diameter, is quite sufficient to warm each of the large apartments or stories of the printing-office from which the present work issues.

There can be no proper comparison between this plan of heating and that of common fireplaces. Coal-fires cannot warm the air in large workshops; the heat is confined to their own immediate neighbourhood; hence the workmen are often obliged to draw near the grate to warm themselves. According to the plan here adopted, every part of the house is equally heated, and the whole of the workmen are as comfortable during the hardest frosts as if they were working in a pleasant summer day. It is difficult to estimate the expense of supplying the heat, seeing that the steam happens to be drawn from a boiler which is always in operation for other purposes. Excellent, however, as the process is, it is for many reasons unsuited to private dwelling-houses.

In calculating how much surface of steam-pipe will be sufficient to warm a room, it is customary to allow about 1 foot square for every 6 feet of single glass window, of usual thickness; as much for every 120 feet of wall, roof, and ceiling, of ordinary material and thickness; and as much for every 6 cubic feet of hot air escaping per minute as ventilation, and replaced by cold air.

Hot Water.—Hot-water apparatus was applied as early as 1777 by M. Bonnemain, in Paris, to warm the hot-houses at the Jardin des Plantes, as well as for the artificial hatching of chickens. It was first introduced into England by the Marquis de Chabannes in 1816, and is now used in many large buildings. It is more economical than steam, except where a steam-boiler is required for machinery; and from this and other advantages, it is generally preferred to steam-apparatus. One of these advantages is, that the heat begins to be distributed, in some degree, as soon as the fire is lighted, while with steam-apparatus the whole of the water must be at boiling-heat before any steam enters the pipes.

There are two kinds of hot-water apparatus—high-pressure and low-pressure. In the first, the water is confined, and can be heated to any degree; in the other, it is open to the air, and cannot be

heated above 212°. Fig. 4 will explain the way in which water is made to carry the heat of a furnace to any part of a building by the low-pressure method. *a* is a boiler, from the top of which a tube issues, and after circulating through the building, re-enters near the bottom. At the top of the circuit, there is a funnel, or a small cistern, *c*, by which the tubes and boiler may be kept full. When the fire is lighted at the bottom of the boiler, the heated portion of water, being lighter than the rest, rises towards the top through the tube, *bb*, while the colder water from *dd* flows in to take its place. The tube is made to traverse the apartments to be warmed, where it gives out its heat to the air; the returning portion of the pipe is thus always colder, and therefore heavier than the other, so that the circulation is constantly kept up. The warming surface is increased, wherever it is necessary, by coiling the pipe, or by making expansions upon it of various forms, so as to constitute water-stoves.

Fig. 4.

To avoid the necessity of so large a surface, and such a mass of water as is required at the low temperature the water attains in the pipes of this kind of apparatus, Mr Perkins introduced the high-pressure system. In this, the pipe is made comparatively small, but very strong, and is formed into an endless circuit cut off from the atmosphere. The water is heated, by making a number of coils of the pipe itself pass through the furnace; and as the whole circuit forms a shut vessel, as it were, the temperature may be raised to 300° and upwards, according to the strength of the pipes. This high temperature causes a rapid circulation. A compendious and readily understood specimen of the apparatus, calculated for a house of three stories, is presented in the accompanying engraving. In filling the tube with water, which enters at *b*, care is taken to expel all the air; and at *a* there is an expansion of the tube, equal to 15 or 20 per cent. of the capacity of the whole, which is left empty both of water and air, to allow for the expansion of the water when heated. The arrangement of the pipe may be various: the plan generally followed is to place a considerable coil of it within a pedestal or bunker, with open trellis-work in front, in a convenient part of the room. It may also be made to wind round the room, behind the skirting-board, which, being perforated with holes, will allow of the entrance of the warmed air.

Fig. 5.

The hot-water apparatus has been fitted up by Messrs Perkins and Heath in various public buildings, warehouses, and gentlemen's houses; and, while sufficiently effective for the desired end, it has been proved to be attended with as few drawbacks as any regulated mode of heating whatever. But there is a great obstacle to its general adoption in its expensiveness. The temperature also becomes at times so high as to cause a disagreeable odour. Another objection is its liability to burst; though, from the tubes being of malleable iron, such an accident causes more inconvenience than serious danger.

Conservation of Warmth.—The art of warming embraces not only the production and distribution of heat, but the construction of apartments with a view to prevent its escape. The way to effect this—setting aside in the meantime the necessity of renewing the air—is, in the first place, to make the walls, floor, windows, doors, &c. as impervious to air as possible, to prevent the heat from being carried off by currents; and in the next place, to make them bad conductors of heat. For this last purpose, the walls ought to be sufficiently thick, and, if possible, built of non-conducting materials. Solid iron would make a cold wall; wood, a warm one; and in this respect brick or porous stone is preferable to hard stone. But the chief element in a warm wall is that it be *double*, which every wall in effect is, when it is lined by a coating of plaster, kept apart from the wall itself by the laths. The plate of confined air between the two is the most effectual barrier to the passage of the heat outwards that could be contrived. By making iron walls double or cellular, with a lining of plaster, they might be rendered as warm as wished. Windows are a great source of cold, not merely by admitting cold air, but by allowing the heat to pass by conduction through the thin glass. The air of the room that touches the window is robbed of its warmth, and is constantly descending in a cold stream towards the floor. There is thus a cold influence felt from a window, however close it is. This is partly arrested by window-blinds, shutters, and curtains, which check the flow of the air, and retard its carrying power. But a far more effectual plan is to have double windows: either two frames, or double panes in the same frame. The loss of heat by a double window is said to be only one-fourth of that by a single. Double windows are considered essential in countries where the winters are rigorous.

By carrying these principles far enough, we might succeed in well-nigh imprisoning the heat, and thus produce a house of ideal perfection, so far as mere temperature is concerned. But for the habitation of living beings, another condition, seemingly antagonistic to the former, is no less requisite—'air as free as that on a mountain-top.' In general practice, the two hostile conditions are not so much sought to be reconciled as compromised; and then, as usual, neither object is well attained. Circulation of air is got accidentally, through the imperfections of structure in our rooms—through the chinks and bad fittings of the windows, doors, floors, and the uneconomical fashion of our fireplaces. Were houses much better constructed than they are, the inmates would in many cases be suffocated outright, as they often partially are with the degree of perfection we have already attained. Neither the airing of our houses, nor the art of building them solid and warm, can advance to perfection, until the former be no longer left to chance, but be in every case secured by special apparatus capable of direct control. We now proceed to consider how this is sought to be attained; confining ourselves still to the leading

principles, and only noticing a few of the specific plans that have been put in practice.

VENTILATION.—The necessity of constantly renewing the air wherever living beings are breathing, arises chiefly from the effects produced upon air in the lungs (see *RESPIRATION*). The average quantity of carbonic acid in expired air or breath is found to be 4.3 per cent. by measure. Now this gas, when taken into the lungs, is a poison, and tends to arrest the vital processes. Like other poisons, however, it can be rendered harmless by *dilution*. The small proportion naturally existing in the atmosphere is perfectly innocuous, and may be considerably increased without sensible effect. But it is decidedly prejudicial to breathe for a long time air containing 1 measure in 100 of carbonic acid; and it is considered desirable that the proportion should never exceed 1 in 500. We may assume, then, what is near the truth, that 20 cubic feet of air pass through the lungs of a man in an hour. To reduce the poison of this to 1 per cent., at which point it is barely respirable, it requires to mingle with as much fresh air as will make a mixture of nearly 100 cubic feet; and to make the dilution at all safe, it must be carried five times as far. In other words, the respiration of one human being vitiates hourly about 500 cubic feet of air.

In addition to carbonic acid, expired air contains an undue amount of watery vapour. Minute quantities of animal matters are also exhaled with the breath, which in close ill-ventilated apartments form a clammy deposit on the furniture and walls, and, by putrefying, become organic poisons.

A further necessity for the constant renewal of fresh air arises wherever lights are burned. The deteriorated air of a fire goes off by the flue, but lights are generally burned where the products must mingle with the atmosphere of the apartment. Now, a pound of oil in burning consumes the oxygen of 13 feet of air, and produces a large amount of water in vapour, and also of carbonic acid. Every cubic foot of gas consumes the oxygen of 10 feet of air, and forms at least 1 foot of carbonic acid, besides watery vapour, sometimes mixed with sulphurous fumes.

To counteract these various sources of pollution, and keep the air sufficiently fresh and wholesome, in rooms where many persons are breathing, it is found in practice that on an average about 20 cubic feet of fresh air per minute for each individual must be supplied.

Ventilation consists of two operations—the removal of the foul air, and the introduction of fresh. Though neither operation can go on without the other going on at the same time, it is convenient to consider the two separately.

The agents employed in removing the air from apartments are chiefly two: that by which nature effects the ventilation of the earth on a grand scale, viz., the draught of ascending currents produced by difference of temperature; and mechanical force, such as pumping. The former is the more common, and is the only one applicable to private houses.

The column of air in the chimney of a lighted fireplace being expanded and comparatively light, exerts less than the prevailing pressure on the air immediately under and about its base. The air, therefore, below and around it pushes it up, and flows in to take its place; the velocity of the movement being in proportion to the height of the chimney and the degree of heat. Thus, although it is often convenient to speak of the air being *drawn* or *sucked* into the chimney, the force does not lie in the chimney, but in the greater pressure of the air behind.

Wherever, then, there is a heated chimney, there

WARMING AND VENTILATION.

is a means of removing the foul air. And in rooms moderately lofty and spacious, with windows and other fittings not closer than usual, and a chimney-mouth of the usual width, there is little risk, when there are only a few inmates, of any serious vitiation of the air. The heated breath that ascends to the ceiling has time to diffuse itself gradually, and be drawn in a diluted state into the currents that are setting from all quarters towards the chimney. These currents, however, are one great objection to this mode of ventilation, as they consist in great part of cold air that has just entered by the doors and windows, and are strongest where the inmates sit to enjoy the fire.

The ascent of foul air to the top of the room dictates its exit in that direction, rather than low down at the mouth of the chimney. It is conceived by some that the carbonic acid of the breath, from its greater weight, must be chiefly at the bottom of the room; but this is a mistake. The heated breath ascends instantly, because it is, as a whole, lighter than the air around it; and the carbonic acid in it does not tend to separate from it and fall down by its superior weight, but, by the law of the diffusion of gases, seeks to spread itself equally all over the room, and would do so though it were lying at first on the floor. It is on the principle of the foul air ascending at first to the top of a room, that Dr Arnott's ventilating-valve is contrived. The valve may be used to supplement the open-fire draught in small and crowded apartments, and is essential where the fire is burned in a close stove or in the smokeless grate. The valve is represented at *v*, fig. 1. An aperture is cut in the wall over the chimney, as near to the ceiling of the apartment as may be convenient. In this is suspended a valve, capable of opening inward to the chimney, but not in the other direction, by which means a return of smoke is prevented. The valve is so balanced on its centre of motion, that it settles in the closed position, but is easily opened. A flap of 36 square inches is sufficient, where there is good chimney-draught, for a full-sized room with company. This simple apparatus may be painted or otherwise made ornamental. It operates by virtue of the draught in the chimney. Whenever that is active from the presence of a fire, the valve is seen to open inwards, and a stream of air from the top of the apartment passes through into the chimney, and is carried off. The operation is precisely equivalent to the stream of air always passing into a chimney between the fire and the mantel-piece, but has the great superiority of draining off the most impure air in the room. A wire descends to a screw or peg fixed in the wall, by which the opening of the valve may be limited or altogether prevented. This is a far more efficient plan of ventilation than an open window, or an opening in the wall near the roof, leading merely to the outer air; where there is an open fire in the room, such openings rather admit a rush of cold air than let out the foul.

There is generally more or less draught in a chimney even without a fire, from the air within being slightly warmer than that without; and this action might be strengthened by burning a jet of gas within the ventilating aperture at *v*. Where a house is to be built new, some recommend having special ventilating-flues in the walls, separate from, but close to the fire-flues, so that the air may be heated, and an ascending current produced. In weather when fires are not required, the draught can be maintained by gas-jets at the entrances to the vents. This plan of causing a draught by gas is applicable to churches and apartments without fire-places.

Where a fire is burned for the express purpose of

producing a current of air, it is called ventilation by *fire-draught*. The plan has been exemplified with success in mines, where a fire being lighted at the bottom of a shaft, air is drawn off in all directions around, and sent up the shaft; to replace which, fresh air is constantly pouring down other shafts.

Many of our large buildings are ventilated by fire-draught. Fig. 6 shews an arrangement by

Fig. 6.

which a school or church may be ventilated: *aa*, the flooring perforated with holes, through which air, warmed by hot-water pipes, passes to the interior. The ceiling, *bb*, is perforated, leading to a chamber which communicates with a vertical flue, *cc*; which leads to the fireplace of the warming-apparatus, situated at the foot of a flue, *ed*. As the only air which reaches this must pass from *cc*, a constant current is maintained therein, and also through the apertures in the ceiling. Dr Reid exemplified this method, first in his own class-room in Edinburgh, and afterwards in various public buildings, among others, in the temporary House of Commons, erected after the burning of the old house in 1834. The plan was attended with some inconveniences—in fact, no plan can meet every contingency—but, notwithstanding the storm of hostile criticism that was raised at the time, Professor Tomlinson (*Treatise on Warming and Ventilation*, 1864) gives it as his opinion that, 'in the case of the temporary House of Commons, where all the arrangements were left in his own hands, he succeeded in the proposed object of removing the vitiated air, and keeping up a constant supply of warm or of cool air to fill its place.' The arrangements for warming and ventilating the present House of Commons are a modification of Dr Reid's plan.

In other cases, as at the prison in Millbank, warm air is admitted at the ceiling, and carried off by the draught of a chimney in connection with the sides or lower part of the rooms.

In these last-mentioned instances, the apparatus provides as well for the admission as for the removal of air. In ordinary dwellings, no special provision is in general made as to admission. It is, in fact, not absolutely necessary; for the removal of a portion of the air of a room never fails to secure the entrance of a fresh supply somewhere. Whenever the chimney-draught or other means removes a little of the pressure inside the room, the pressure without forces air through every opening and chink; and even, were there no actual openings, would force it through the porous substance of the structure—such as mortar, and even wood itself. But this irregular source of supply has various inconveniences. It often requires more force to strain the air in this manner than the draught is possessed of, and then the chimney smokes; it is smoke produced by this cause that is curable by opening the door or window. Another objection is, that impure air is often thus drawn into rooms from the lower parts of the building and from drains about the foundation. For these and other reasons, there ought, in all cases, to be a free and legitimate entrance provided for fresh air, so as to give a control over it; and this entrance should be independent of the windows. It is a much disputed point whereabouts in a room the air should be made to enter—some advocating openings for it near the floor, others near the ceiling; and it must be confessed that neither method has yet been

rendered unobjectionable. One essential thing is, to prevent the air from rushing in with a strong current, by passing it through minute holes spread over a large space. A tube, for instance, leads from the outer air to a channel behind the skirting, or behind the cornice, and the air is allowed to issue into the room through minute holes, or through a long, narrow, and concealed opening covered with perforated zinc or wire-gauze. The passage or tube leading from outside the wall can be more or less closed by a valve regulated from the inside.

But the great difficulty lies in the coldness of the air directly introduced from the outside, whether by the doors and windows, or through channels in the walls; and all such plans of ventilation must be considered as imperfect make-shifts. The fresh air ought in every case to be warmed before being admitted, or, at least, before being allowed to circulate in a sitting-room. In the smokeless grate (fig. 1), the air is led directly from the outer atmosphere into a channel (1, 2) underneath the hearth, and escaping below the fender and about the fire, is warmed before spreading through the apartment. With stoves and heated pipes, the air should enter about the heated surface; in stoves on the cockle principle, the fresh air, as it enters, is made to pass between the casings of the stove. With an open fire, a very feasible plan is to make the fresh-air channel pass behind the fireplace, and allow the warmed air to escape from concealed openings about the chimney-piece and jambs, or from behind the skirting. In Condy's Ventilating-grate, the fire-box is constructed of hollow pieces of fire-brick communicating with the external atmosphere and with the room.

For a house with fireplaces of the usual construction, perhaps the simplest and most effective expedient is to admit the fresh air into the entrance-hall, and there warm it by means of a low-temperature stove or by hot-water pipes: its passage into the several rooms can then be provided for by regular channels, behind the skirting or otherwise. In America, perforations are frequently made in certain parts of the doors, before which silk curtains are disposed, so as to temper the currents. It is almost unaccountable that in this country the plan of warming the lobby and staircase is so seldom resorted to. To say nothing of the comfort thus diffused through the whole house, and the benefit in point of health, especially to weakly constitutions, the economy of the arrangement is beyond dispute. In the sitting-rooms, not more than one-half the usual quantity of fuel requires to be burned in the open fires; and in the bedrooms, as a rule, fires are rendered altogether unnecessary in the coldest weather. It ought to be observed that when air is admitted by a regular and free channel, comparatively little is strained in by the windows and other byways.

Ventilation by Fans and Pumps.—The fan-wheel has been for many years used in factories, to which it is particularly applicable, from the readiness with which it can be kept in motion by the engine. It is essentially the same as the barn-fanners; the air is drawn in at the centre of the wheel, and flies off at the circumference by centrifugal force. The fan is placed at the top of a flue, into which branches from all parts of the establishment proceed; and when it is set in motion, it draws off the air from every apartment communicating with it. Dr Arnott observed, that in the fan-wheel as well as in the air-pump or bellows invented by Dr Hales, a great deal of power was wasted by 'wire-drawing' the air—that is, making it squirt through small valves or other narrow openings. To obviate this, he invented a ventilating-pump, which supplied a hospital with fresh air, requiring no other motive-power

than the descent of the water used in the establishment from a high reservoir to the lower parts of the building. It is described in his work on *Warming and Ventilation*.

Transference of heat from the used air to the fresh.—This is the kind of economy which is put in practice in the Respirator (q. v.) and in the Caloric Engine (q. v.). Whatever difficulties—or impossibilities, as some maintain—there may be in the way of turning this transferred heat into a fresh source of power, nothing seems simpler, in theory at least, than to economise heat in this manner for the warming of dwellings and similar purposes. The idea originated with Dr Arnott, many years ago, who thus illus-

Fig. 7.

trates it in the case of water: Suppose *a* a vessel of boiling water, with a thin metallic tube issuing from the bottom, and having a stop-cock at *d*; and *b* a similar vessel of water at freezing, the tube of which is larger, and envelops the other. When both are flowing simultaneously, the hot water, if the tube is long enough, will have lost all its excess of heat before getting to *d*, while the counter-current will have gained all that the other lost. In an experiment with tubes six feet long, the boiling water from *a* issued from *d* at 34°, and the freezing water from *b* issued from *c* at 210°. It is clear that if *a* were a bath, the warm water in it, after being used, might in flowing out be made to heat the cold water from a reservoir, *b*, flowing into another bath below *c*. We are not aware that the principle has ever been acted upon; but the possible economy of heat is obvious, and it only requires mechanical ingenuity to realise it.

It will at once strike the reader how desirable it would be to do the same with the impure heated air which we are obliged to eject from our dwellings. Where the ventilation depends upon the draught of a common chimney, it would seem impossible to bring the entering air in contact with that which is escaping; but where the mechanical force of a pump or a fan is employed, nothing seems simpler than to make the two currents run counter to one another for a certain distance in close contact through a system of tubes. The smoke even, which, with the most economical arrangements, still issues from the flues at a temperature considerably above that of the building, might be drawn into the current along with the foul air of the apartments, and the whole reduced nearly to the temperature of the atmosphere before being allowed to escape. Of course, there must be loss in the transference; but a large percentage would be saved, and the consumption of fuel would be reduced by that amount. Were this 'double-current ventilation' applied to churches, ball-rooms, theatres, &c., where thousands of persons are assembled, Dr Arnott believes that 'no other heating apparatus will be required but the lungs of the company.'

Notwithstanding all the improvements recently effected, it is beyond doubt that this important branch of the art of living is still in a very rude and imperfect condition. A writer in the *Quarterly Review* for April 1866, in a very suggestive article on *Coal and Smoke*, points to the radical error of the existing system, when he remarks that 'in a

household fire heat is, as it were, manufactured on a very small scale; and experience has proved that the cost of production of an article has always been inversely proportionate to the scale of its manufacture.' He accordingly suggests that 'it seems practicable, in a great measure, to supersede domestic fires, and to lay on heat (heated air), or the means of generating heat (low-priced gaseous fuel), to our houses pretty much as we now lay on gas.' The abatement of the smoke- nuisance, and systematic and thorough ventilation, ought to be effected on a similar joint-plan, 'by connecting the chimneys of all the houses with underground culverts, provided at intervals with high shafts, in which, if necessary, the draught upwards might be increased by furnaces. We have long been familiar with extensive manufactories, covering large areas, in which are very numerous fires, all in communication with a single lofty chimney. With such an arrangement, no visible smoke should be produced, and with due attention, a smoky chimney should be impossible.' In the case of existing houses, the amount of reconstruction necessary might be a serious obstacle; but in building a new street, it might easily be made to empty its entire smoke through the medium of a single tall tower resembling those medieval campanili which are to be seen in Bologna and other Italian cities.' It is further proposed to make the ordinary sewers serve the purpose of culverts for the passage of the smoke to the common chimney. The sulphurous acid of the smoke would destroy the noxious qualities of the sewage gases, and improve the sewage for agricultural purposes; and instead of foul gases escaping through every opening or leak in the sewers, as at present, the powerful suction of the ventilating shafts would draw in fresh air, thus establishing a thorough system of atmospheric sewage. Another effect of the common chimney system would be to make the transference of heat, or double-current ventilation, spoken of above, easily practicable in domestic houses. The pipe through which the heated air and smoke were being drawn away might be made to give up its heat to the counter-current of fresh air which was being drawn in.

Even though such painstaking plans of economising heat might not pay at the present cost of fuel in this country, it is pleasing to think that there is such a resource in reserve. It is not with all countries as with us; and even our stores of coal are not inexhaustible. It is an unworthy, and, in the real sense of the word, an inhuman maxim, that bids us 'let posterity look to itself.' If the absorbing passion for present gain will not let us begin practising economy now, we may at least seek to devise and perfect plans to be in readiness when the necessity comes. It is not uncommon to hear the argument, that before the coals are done, something else will be discovered as a substitute. We are at a loss to imagine what the something is to be, unless it be the ingenuity to make the fuel that is now wasted in a year last a hundred; and this we believe to be quite possible.

WARMINSTER, a small ancient town of Wiltshire, on the west border of Salisbury Plain, and 19 miles north-west of Salisbury. The parish church dates from the reign of Henry III.; and the interesting edifices in the town and neighbourhood are numerous. An important corn-market is held every week. Pop. (1860) 3675.

WARNING, in Scotch Law, means a notice given to terminate the relation of master and servant, or landlord and tenant; corresponding in England to notice to leave and notice to quit respectively.

WAR OFFICE, the immediate office of the Secretary of State for War, and the centre on which pivots the entire administration of the army. It is subdivided into a number of departments, each under a chief officer, who is at the head of that section of the labour, and is directly responsible to the Secretary of State. The last-named high officer is aided by two Under-secretaries of State, an Assistant Under-secretary, and a Military Assistant. Under these and the heads of departments there are about 450 clerks, with 50 messengers, &c.

WAR-OFFICE REGULATIONS consist of the royal warrants regulating the pay, retirement, and allowances of officers and men of the army, together with the instructions to paymasters and others considered necessary for the proper carrying out of the warrant.

WARP, in Weaving, signifies the yarn or thread which runs lengthwise in the cloth. See **WEAVING**.

WARPING, a mode of improving land, practised where rivers bring down large quantities of mud, or where mud is brought up from estuaries by the tide. It is practised in some of the valleys of the Alps; and the rich soil brought down from the mountains is thus arrested, and made to increase the fertility of fields. It is practised also in England, on the tidal waters of the Ouse, Trent, and other rivers falling into the Humber. There are not many places in Britain where the process of warping is capable of profitable application. The term warping belongs to the banks of the Humber. The name *warp* is there given to the large quantity of earthy particles held in suspense by the tidal waters. About a century ago, warping began to be practised, by means of small tunnels made through embankments, the water being allowed to remain, and deposit its sediment of earthy particles, before the sluices were opened for it to flow off. Warping has now long been carried on, upon a larger scale, with large canals, embankments, and flood-gates. Many acts of parliament have been obtained for large warping canals, to lead tide-water over great tracts of land. Land previously sterile and worthless has been covered with good soil, and has become very productive. The 'compartment' which is embanked around, in order to warping, is generally only fifty acres, or less; the farmer warping only one field in a season, because in the meantime it is unproductive. In some cases, however, 500 or 600 acres have been warped in one piece. In the rivers which flow into the Humber, the water coming down the river in floods is unsuitable for warping, and contains no such quantity of sediment as the tidal waters.

WARRANTICE, in the Law of Scotland, is the obligation to indemnify the grantee, or purchaser of land if, by defect of title, there should be an evictive or paramount claim established against the lands. Warrantice is personal or real; and personal warrantice is subdivided into general and special. Special warrantice is either (1) simple—i. e., that the grantor shall do nothing inconsistent with his grant; or (2) warrantice from fact and deed—i. e., that the grantor has not done, and will not do any contrary deed; or (3) absolute warrantice, or warrantice against all deadly—*contra omnes mortales*—i. e., that the grantor shall be liable for every defect in the right which he has granted. Real warrantice is where the grantor or vendor conveys another estate or lands, called warrantice lands, to be held by the grantee in security of the lands originally granted.

WARRANT OF APPREHENSION is an authority given by a justice of the peace to apprehend some criminal to answer a charge of

misdeameanour, felony, or treason. It is in the form of a command in her Majesty's name, issued by the justice to a constable, and to all other peace-officers of the county, reciting that an offence has been committed, and that oath has been made as to the offender, and commanding the constable to bring the offender before him (the justice), or some other of her Majesty's justices, to answer the said charge, and be dealt with according to law. The warrant must be signed and sealed by the justice. It may be issued and executed on a Sunday as well as any other day. In Scotland, the sheriff or justice of the peace who issues a warrant to arrest does not seal the document. In both countries, the warrant must name the individual arrested. In England, the party must either be taken or seized, or hands must be laid on him, accompanied with the words: 'I arrest you.' If the party arrested demand to see the warrant, the constable, if a known officer, is not in strictness bound to shew it to him; but if the officer is not a known officer, and not acting within his precinct, then he must shew the warrant. It is enough for the constable to say simply that he arrests in the Queen's name. If the party to be arrested be in a house, and the doors be fastened, the constable may, after first demanding admittance, and being refused, break open the doors. If, however, the house be a stranger's house, the constable who breaks open the door is not justified in doing so unless the criminal be actually within. A general warrant, i. e., a warrant to apprehend all persons suspected, without naming or particularly describing any individual, is illegal and void for uncertainty, for mere vague suspicion is not enough to deprive any man of his liberty. A practice had obtained in the Secretary of State's office ever since the Restoration, grounded on some clauses in the acts for regulating the press, of issuing general warrants to take up (without naming any person in particular), the authors, printers, or publishers of such obscene or seditious libels as were particularly specified in the warrant. When these acts expired in 1694, the same practice was inadvertently continued in every reign, except the last four years of Queen Anne, till the question was raised and decided as to the validity of such warrants, and they were declared by the Court of Queen's Bench illegal. The House of Commons in 1766 also passed a resolution declaring the issuing of general warrants to be illegal.

WARRANT OF ATTORNEY, in English Law, is an authority given by a debtor to some attorney to enter up judgment against him in any action that may be brought to recover a particular debt. It is generally given by a debtor when he finds he has no defence, and wishes to gain time; and if he do not carry out his promise, the effect is that the attorney can immediately sign judgment, and issue execution against him, without the delay and expense of an ordinary action. But to prevent the malpractices of attorneys, and any imposition upon ignorant men, no such warrant is legal unless the debtor had his own attorney present, expressly named by him, and attending at his request, to inform him of the nature and effect of such warrant; and such attorney must subscribe his name as a witness. It is also provided that all warrants of attorney shall be void unless they are filed, within 21 days after execution, with the clerk of the judgments in the Queen's Bench.

WARRANT-OFFICERS, on Shipboard, are the highest grade to which seamen ordinarily attain. They are the gunner, boatswain, and carpenter. Their widows receive pensions.

WARRANTY, in English Law, is a promise or covenant to warrant or secure, against all men, a

certain person the enjoying of the thing granted or sold to him. As applied to ordinary sales of things personal, it is used to secure the truth of certain representations which the purchaser has no means, or has imperfect means, of ascertaining for himself, and yet the knowledge of which is material to the contract. The law does not imply from the mere seller of an article in its natural state, who has no better means of information than the purchaser, and who does not affirm that the article is fit for any particular purpose, any warranty or undertaking beyond the ordinary promise that he makes no false representation calculated to deceive the purchaser, and practises no deceit or fraudulent concealment, and that he is not cognizant of any latent defect materially affecting the marketable value of the goods. In the ordinary sale of a horse, the seller only warrants it to be an animal of the description it appears to be, and nothing more; and if the purchaser makes no inquiries as to its soundness or qualities, and it turns out to be unsound and restive, or unfit for use, he cannot recover as against the seller, as it must be assumed that he purchased the animal at a cheaper rate. And on the sale or transfer of wares and merchandises, if nothing is said as to the character or quality of the thing sold, the buyer takes the risk of all latent defects unknown to the seller at the time of the execution of the contract of sale; all that the seller answers for being that the article is, as far as he knows, what it appears to be. Whenever a man sells goods as owner, he impliedly undertakes and promises that the goods are his own goods, and that he has a right to make the sale and transfer which he professes to make; and if he was not the owner, he is responsible in damages if the real owner claims them from the purchaser. If the purchaser does not himself inspect and select the subject-matter of sale, the seller impliedly warrants the article he sells to be the very article the purchaser has agreed to buy, and is responsible in damages if he furnishes a different article. If the vendor is told the article is wanted for a specific purpose, then he is taken to warrant impliedly that the article he furnishes is sufficient for that purpose. Every victualler or dealer in provisions impliedly warrants them to be wholesome and fit for food. But a private person who does not trade in provisions is not responsible for selling an unwholesome article of food without fraud and in ignorance that it is unfit to eat. Where buyer and seller have equal means of knowledge, then the vendor is not liable for any representation which he makes without fraud; but if, from the nature of the case, the vendor has the exclusive means of knowledge, then he impliedly warrants that what he says is true. Warranty is also to be distinguished from mere matter of opinion or belief. When a servant sells a horse, he has no right to give a warranty, unless his master expressly authorised him to do so. In the law of Scotland, the doctrine of Warranty of Goods does not substantially differ from the above.

WARREN is a place kept for the purpose of breeding game or rabbits. In its strict legal sense, a right of free warren can only be derived by grant from the crown, and gives certain privileges to the warrenor as to recovering game and destroying dogs which infest it (see Paterson's *Game Laws*, 20); but in the popular sense, a warren merely means a preserve for keeping game and also rabbits.

WARRINGTON, a parliamentary and municipal borough and manufacturing town of Lancashire, on the right bank of the Mersey, 16 miles east of Liverpool by railway. After the parish church, which is of Saxon origin, the chief buildings to be mentioned are the cotton and other factories and the

cloth-halls. In the older streets, ancient wooden houses are even yet to be seen. The manufactures of W. comprise cotton goods, as fustians, twills, corduroys; sailcloths and sacking; files, pins, wire and wire-woven work; glass; leather and soap; and a famous ale is brewed. Vessels of 100 tons can ascend the Mersey as far as the bridge of this town. Pop. of parliamentary borough, which returns one member to parliament, (1861) 26,947.

WARSAW, formerly the capital of Poland (q. v.), now (1867) capital of the Russian, or rather Russianised, government of W., stands on the left bank of the Vistula, about 300 miles east of Berlin by railway. Lat. of observatory, 52° 13' N., long. 21° 2' E. It stands partly on a plain, partly on rising ground sloping upwards from the left bank of the river, extends over a wide area, and consists of the city proper, and of a number of suburbs, several of which are beautifully built. A bridge of boats 1626 feet long connects W. with the suburb of Praga, on the right bank of the Vistula. The streets are mostly narrow, though in several instances they are broad and handsome. The Vistula at W. is broad, shallow, and ever-changing in its sandy course, and is navigable for large vessels only when, after thaw, rivers of melted snow pour down into it from the Carpathians, or when it is swelled by the autumn rains. But the only craft seen here on the Vistula are rude rafts, usually laden with wheat, which they convey to Danzig by river, and (within the last few years) steamers at intervals. Seen from Praga, on the right bank, the Castle, standing on a steep ascent, has a most imposing effect. Attached to the Saxon Palace are a spacious court and gardens, which are considered the finest promenade in the city. Among the other buildings there are nearly 30 palaces; the cathedral of St John (dating from 1250), a Gothic building of great beauty, containing statuettes and many interesting monuments, among which is one by Thorwaldsen; the Lutheran church, the loftiest building in W., and numerous other places of worship, including synagogues. There are several large and memorable squares, as the Sigismund Square, containing the monument, erected by Ladislas IV., in honour of his father, Sigismund III. In this square, in April 8, 1861, 40 unarmed and unresisting Poles were massacred. The citadel, erected by the Emperor Nicholas, for the express purpose of intimidating, and, if necessary, destroying the city, commands, from its situation, every part of Warsaw. The university, broken up by the Emperor Nicholas after the insurrection of 1830, has been re-established within recent years, through the influence of the Grand Duke Constantine; and besides this institution, there are several minor colleges, gymnasia, and other educational establishments. Woollen and linen fabrics, hosiery, hats, gold and silver wares, saddlery, &c. are manufactured. Pop. (1865) 243,512.

For the history of W., see POLAND, JOHN III. (SOBIESKI), PONIATOWSKI, &c.

WARTBURG, WAR OF THE, the name given both to a grave poetic contest, which is represented to have taken place on the Wartburg, and also to a poem in the Middle High-German dialect, which commemorates the event. At the time when the aforesaid dialect had attained its highest literary development, and its poets enjoyed a brilliant reputation, Hermann, the munificent Landgraf of Thuringia, had made his court a sort of refuge or home for the *irritable race*, as well as for many other people. It could hardly fail, under the circumstances, that quarrels and jealousies should abound; and, in fact, allusions to these are sufficiently distinct in several of the most distinguished writers who lived

at the Thuringian court—e.g., in Wolfram von Eschenbach and Walther von der Vogelweide. But soon after, the conception of these things underwent a sort of mythical transformation, and the occasional temporary and natural rivalries of the poets were changed into a particular and premeditated contest for superiority in poetic skill; and to the list of those poets who actually had intercourse with each other at Eisenach were now added others partly historical, and in part purely fictitious characters—e.g., the virtuous Schreiber, Bitterolf, Reinmar (subsequently confounded with Reinmar von Zweter), the almost mythical Heinrich von Ofterdingen, and the wholly mythical Master Klingsor, the Transylvanian magician and astrologer. On the basis of this historico-mythical tradition, and under the formal influences of the then much admired songs of emulation, riddle-contests, and ecclesiastical plays, there was composed, about the year 1300, a strange, obscure, unharmonious poem in two parts, called *Kriec von Wartburg*. In the first of these, executed in a long and artistically managed measure, and entitled *Tone des Fürsten von Thuringia*, Heinrich von Ofterdingen challenges the other poets to a contest in verse—the fate of the vanquished to be death—and asserts the excellence of Leopold, Duke of Austria, over all the other princes. Victory, however, inclining to the Eisenachers, Heinrich calls in Klingsor to his aid, who, on his part, fights his verse-battle against Wolfram by the assistance of evil spirits, with riddles and dark science. With distinct reference to Klingsor's 'black art,' the simpler and shorter measure of this second part is called *Schwarze Ton*. Throughout the whole poem, which may be regarded as the first attempt at a secular drama, but which is rather an intermediate link between the Lyric contest and the Drama, one may trace an unmistakable imitation of Wolfram's style of poetry. The author is unknown. From the inequality of the style, one is disposed to conclude that several hands were employed in its composition. The poem, which has been much overrated in modern times, does not seem to have exercised any particular influence on literature. In a prose form, the story of the Wartburg Contest first appears—in the Thuringian Chronicles—after the beginning of the 14th c., and probably owes its origin to the poem. The poem was printed in a separate edition by Ektmüller (Ilmenau, 1830), and is also to be found in Bodmer's and Von der Hagen's collection of the *Minnesinger*.—See Von Plotz, *Über den Sängerkrieg auf Wartburg* (Weimar, 1851).

WARTHÉ, the longest and most extensively navigable affluent of the Oder, rises on the south-west frontier of Poland, 35 miles north-west of Cracow. In Poland, it flows north and west, and the length of its course in this country is 300 miles. It then flows west-north-west through Prussia for 180 miles, passes Posen, and joins the Oder at Mustrin, where it is 620 feet broad. Total length, 483 miles, for 220 miles of which it is navigable.

WART-HOG (*Phacochoerus*), a genus of *Suidæ*, closely resembling the true hogs in most of their characters, and particularly in their feet, but remarkably differing from them in their dentition; the molar teeth being much like those of the elephant, and replacing one another in the same manner. There are two triangular incisors in the upper jaw, and six small ones in the under; the tusks are lateral, very large, project far from the mouth, and are bent upwards; there are six or eight molars in each jaw. The head is very large, and the muzzle very broad; the cheeks furnished with large wart-like excrescences, so that the appearance is altogether very remarkable and uncouth. The species are all

natives of Africa. They feed very much on the roots of plants, which they dig up by means of their enormous tusks. The AFRICAN W., or HARUJA (*P. Aelian*), a native of Abyssinia and of the central regions of Africa, from the coast of Guinea to that of Mozambique, is nearly four feet long, with a naked slender tail of one foot, is scantily covered with long bristles of a light brown colour, and has a mane sometimes ten inches long, extending from between the ears along the neck and back. Another species is found in the south of Africa (*P. Ethiopianus* or *Pallasii*), the *Valke Vark* of the Dutch colonists

Wart-hog (*Phacochoerus Aethiopicus*).

at the Cape of Good Hope. The incisors of the latter fall out at an early age, those of the former are persistent.—A closely allied genus is *Potamochoerus*, of which there are several species, as the *Bosch Vark* of Cape Colony (*P. Africanus*), which is nearly black, with whitish cheeks having a central black spot; and the PAINTED PIG of West Africa (*P. penicillatus*), which is reddish, with black face, forehead, and ears. The species of *Potamochoerus* frequent swampy grounds, and sometimes receive the name of WATER-HOG. They have longer ears than the true wart-hogs, tapering and ending in a pencil of hairs; the face is elongated, and has a huge protuberance on each side. The flesh of all the wart-hogs and water-hogs is in high esteem. They are hunted by dogs, which are often killed in the encounter with them. They are much addicted to fighting among themselves.

WARTON, JOSEPH, D.D., was born at Dunsfold, Surrey, in 1722. His earlier education he received from his father, the Rev. Thomas Warton, sometime Professor of Poetry at Oxford. At the age of 14, he was sent to the great school at Winchester, whence, in 1740, he was transferred to Oriel College, Oxford, where, four years afterwards, he took his degree of B.A. After passing the intermediate years as a curate at Chelsea and elsewhere, in 1748 he was presented by the Duke of Bolton to the rectory of Winsdale, near Basingstoke, a living of no great value, yet sufficient to determine his marriage with a Miss Damon, to whom he had been engaged. Previous to this, he had become known as a writer of verse in the *Gentleman's Magazine*, Dodsley's *Museum*, &c., and as the author of a volume of *Odes and other Poems*. In 1751, he went abroad with the Duke of Bolton; and after his return, he issued, in 1753, an edition of Virgil, with a translation of the *Eclogues* and *Georgics*. This, with the critical notes and dissertations appended to the work, met with great approval, and procured him from the university of Oxford the honorary degree of M.A. In 1756, appeared the first volume of his chief literary performance, the *Essay on the Writings and Genius of Pope*, the second and concluding volume of which was not given to the world till 1782. Venturing, as

he did, to question the positive supremacy which it was then fashionable to attribute to Pope, W. did not by this work attain any very instant increase of popularity; but the value in relation to the literature of the time, of the critical principles announced in it, as also in his other more casual Essays, has since been sufficiently recognised. In 1755, W. was appointed second Master of Winchester School, of which he became head in 1766. Soon after, he revisited Oxford, and had conferred on him the degrees of Bachelor and Doctor of Divinity. Of preferment in the church, he had subsequently his full share. By the good offices of Dr Lowth, Bishop of London, he was made, in 1782, a Prebendary of St Paul's; and the living of Thorley, in Hertfordshire, was conferred on him. He obtained besides, in 1788, a prebend in Winchester Cathedral, and the rectory of Easton, which he soon after exchanged for that of Clapham. The Mastership of Winchester he resigned in 1793, and devoted himself to the preparation of an annotated edition of Pope, which was completed in 9 vols. 8vo in 1797. At his death, 23d February 1800, he was engaged on a similar edition of Dryden, of which he had published two volumes. The poetry of W. can scarcely be said to have secured a permanent place in our literature; but as a critic, his reputation survives along with that of his more distinguished brother.

WARTON, THOMAS, the younger brother of the preceding, was born in 1728, at Basingstoke, in Hampshire, of which place his father had then become vicar. His earlier education he received chiefly at home from his father; and in 1743, he was entered at Trinity College, Oxford, where, in 1750, he took his degree of M.A. The year after, he obtained a fellowship. He remained at the university, employed as a tutor; and in 1757, he was made Professor of Poetry, in which capacity he was much esteemed as a lecturer. In 1767, he took his degree as Bachelor of Divinity, and was soon after presented to the living of Kiddington by the Earl of Lichfield. In 1782, that of Hill Farrance, in Somersetshire, fell to him by favour of his college; and these two unimportant pieces of ecclesiastical preferment were the only ones he ever enjoyed. Very early, he became known as a poet, and in 1754, he published a volume entitled, *Observations on the Fairie Queene of Spenser*, which established his reputation as one of the first critics of the day. In a second edition of the work, issued in 1762, it was expanded into two volumes. Of W.'s miscellaneous literary activity, no account need be given in detail. The work by which he is now chiefly remembered is his *History of English Poetry*, the first volume of which was published in 1774. Two other volumes followed in 1778 and 1781, but at his death the work remained unfinished. In its wealth of information regarding the earlier portion of our literature, the book remains to this day unrivalled. As a poet, also, W. takes distinct, if not very high rank. In 1777, he published a collection of such of his scattered pieces as he deemed most worthy of being reprinted, and the acceptance it met with is shewn in the successive editions of 1778, 1779, and 1789, as also in the fact, that on the death of Whitehead, the poet-laureate, W. had the honour, such as it might be, of being selected to succeed him in the office. The last work on which he was engaged was an elaborately annotated edition of the *Minor Poems of Milton*. Of this, published in 1785, a carefully prepared re-impression was issued the year after his death, which took place suddenly on the 21st May 1790. In 1802, a new edition of his poems was published, with a Life of the author by Mr Mant.

WARTS (sometimes known in Surgery by their Latin name *Verrucae*) are collections of lengthened Papillae of the Skin (q. v.), closely adherent and ensheathed by a thick covering of hard dry cuticle. From friction and exposure to the air, their surface presents a horny texture, and is rounded off into a small button-like shape. Such is the description of the simple wart, which is so commonly seen on the hands and fingers (and rarely on the face or elsewhere) of persons of all ages, but especially of children. Amongst other varieties of warts are: (1) One to which the term *Verruca digitata* has been applied. It is more elongated in shape, and less protected by cuticle than the preceding. It is said to occur nowhere but on the scalp of women of adult age, and sometimes to occasion great annoyance in brushing and combing the hair. (2) *Sub-ungual warts*, growing, as their specific name implies, beneath or at the side of the finger or toe nails. They originate beneath the nail, and as they increase, they crop out either at the free extremity or the side of the nail, and are usually troublesome, and often very painful. They are generally of syphilitic origin. (3) *Venercal warts*, caused by the direct irritation of the discharges of gonorrhoea or syphilis, and occurring about the parts which are liable to be polluted with such discharges. They attain a larger size, and are more fleshy and vascular than other warts.

Nothing is known of the causes of warts further than the third variety is induced by an irritating discharge, that the malignant form of wart which is the beginning of chimney-sweepers' cancer is caused by the irritation of soot, and that persons engaged in dissection and *post-mortem* researches are especially liable to them; hence we may infer they are always due to some local irritation. Venercal warts are certainly contagious; with regard to others, we cannot speak positively. In some cases, but not invariably, blood from a wart is capable of producing similar warts when applied to the skin. In consequence of the capricious way in which warts often spontaneously disappear, there are numerous popular charms for their removal, several of which may be found recorded in the pages of *Notes and Queries*. Common warts are so apt to disappear, that they may be often left to themselves. If it is desired to remove them, glacial acetic acid is perhaps the best remedy: it must be applied with a camel-hair pencil till the wart is pretty well sodden, care being taken not to blister the neighbouring skin. One or at most two applications are usually sufficient. Nitrate of silver and tincture of iron are popular and general applications. Small warts hanging by a neck, may often be very simply removed by the moderately tight application of an elastic ligament (for example, a small broken elastic ring) to the base. The wart usually shrivels up, and falls off within a week. The other varieties of warts must be left to the surgeon.

WARWICKSHIRE, one of the midland counties of England, bounded on the W. by Worcestershire, on the N. by Stafford and Leicester shires, and on the S. mainly by that of Oxford. Area 563,946 acres; pop. (1861) 561,855. The surface, though presenting no lofty hills, is marked by gentle eminences and vales. The north districts of the county were formerly occupied by the forest of Arden, of which there are still remains; and the scenery, in general remarkably rich and charming, is varied by moor and heath. The principal rivers are the Avon, flowing from north-east to south-west; and the Tame in the north. The soil varies much in quality, being cold and heavy on the higher and more exposed positions; while in more favourable districts, it is as a rule good. Of the whole area, 444,718

acres are (1866) under crops and grass and fallow, and of this area 151,456 acres are under corn crops, 32,771 acres under green crops, and 209,914 in permanent pasture. Of minerals, coal, stone, lime, and marl are found. The county, exclusive of the boroughs, returns four members to the House of Commons. Chief town, Warwick (q. v.).

WARWICK, a municipal and parliamentary borough, chief town of the county of the same name, stands in the middle of the county, on the Avon, 20 miles south-east of Birmingham. It is a very ancient town, and contains many ancient and interesting buildings and institutions. Of these the most notable is Warwick Castle, the principal residence of the Earls of Warwick, beautifully situated on a rocky elevation, 40 feet high, on the banks of the Avon. Of this edifice, Guy's Tower, 128 feet high, was built in 1394; and Caesar's Tower, still more ancient, is 147 feet high. The interior, remarkable for its splendour and elegance, contains valuable pictures and curious specimens of armour. The Earl of Leicester's Hospital for aged brethren has an annual income of £2016. There are numerous other charities, with schools, libraries, &c. Agriculture and general trade afford employment to a large number of the inhabitants, and a small iron foundry is in operation. W. returns two members to the House of Commons. Pop. (1861) 10,570.

WARWICK, a township of Rhode Island, U. S. America, 10 miles south-west of Providence, on Narraganset Bay, and the Stonington and Providence Railway, containing the villages of Natick, Phoenix, Centreville, Arctic, Crampton, and Apponang. It has 21 cotton-mills, 2 woollen, 2 bleacheries, 2 print-works, 15 churches. Drum Rock, a balanced rock of great size, can be moved by a child, and makes a sound which can be heard for miles. Pop. (1860) 8916.

WARWICK, RICHARD NEVILLE, EARL OF, K.G., popularly named the King-maker, was eldest son of Richard, Earl of Salisbury, and Alice, daughter and heiress of Thomas Montacute. He was born about 1420, shortly before the accession of Henry VI. Lord R. Neville, as he was then styled, early manifested his distinguished bravery and brilliant personal qualities in a hostile incursion across the Scottish marches, in which he accompanied his father, the Earl of Salisbury. He became the most powerful nobleman in the kingdom, by his marriage with Anne, daughter and heiress of Richard de Beauchamp, Earl of Warwick. He not only acquired by this alliance the broad lands of the Warwick family, but was created Earl of Warwick, with succession to the heirs of his wife. He is the most prominent figure in the civil War of the Roses, one of the darkest periods of our history. The Duke of York gained his support by his marriage with Lady Cecille Neville; and when the barons declared the incapacity of Henry VI., and chose the duke to be protector of the kingdom, W. led into the field his well-tried borderers of Wales. The Yorkists and the Lancastrians first met at St Albans in 1455, when W., rushing suddenly into the town at the head of his men, mainly won the battle by his impetuous onset. He was rewarded with the government of Calais—'then,' says Comines, 'considered as the most advantageous appointment at the disposal of any Christian prince, and that which placed the most considerable force at the disposal of the governor.' He also obtained command of the fleet for five years. In 1458, he sailed from Calais with five large and seven small vessels, and attacked a fleet of 28 ships, belonging to the free town of Lübeck. After a battle of six hours, he took six of

the enemy's vessels. In 1460, he landed in Kent at the head of his troops, and entered London amidst the acclamations of the people. He defeated the queen's army, near Northampton, with great slaughter, and obtained possession of the person of the king. Richard, Duke of York, now advanced his claim to the throne. Queen Margaret raised an army to rescue the king; and the duke committed the idiotic monarch to the custody of the Duke of Norfolk and W., while he advanced to Wakefield to attack the Lancastrians. The duke was taken, and put to death; and W.'s father, the Earl of Salisbury, with twelve other Yorkist chiefs, was beheaded at Pontefract. Another battle at St Albans was won by the Lancastrians; but Edward, Earl of March, now Duke of York, accompanied by W., marched boldly upon London, which was throughout Yorkist, and Edward was proclaimed king by the style of Edward IV. The next battle was that of Towton, near York. The Lancastrians had retaken the pass of Ferrybridge, on the river Aire, and W. in despair at the loss of so good a position, rode up to Edward, and dismounting, shot his own horse through the head, as a signal for an attack from which there could be no retreat, exclaiming: 'Sir! let him flee who will flee; but by this cross' (kissing the hilt of his sword) 'I will stand by him who will stand by me!' The Lancastrians were defeated with immense loss; and Edward, returning to London in triumph, was crowned June 22, 1461. The battle of Hexham was followed by the capture of Henry; and W., who had been left in command in London, placed the deposed king on a horse, under whose belly his feet were fastened, and thus led him through Cheapside to the Tower. W. having been authorised to negotiate with Louis XI. of France for the marriage of his sister-in-law, the Princess Bonne of Savoy, to King Edward, could not brook the king's sudden marriage with Elizabeth Woodville, and seemed inclined to shew that he could pull down as well as set up kings. He was now at the height of his power. To the earldoms of Warwick and Salisbury, with the estates of the Spencers, he added the offices of High-admiral and Great-chamberlain, together with the lord-lieutenancy of Ireland and the government of Calais. Comines states the income of his offices at 80,000 crowns a year, besides the immense revenues accruing from his patrimony; yet he had the meanness to accept a secret pension and gratuities from Louis XI. After being sent into honourable banishment by means of embassies to France, Burgundy, and Brittany, he gave his daughter in marriage to George, Duke of Clarence, without asking Edward's permission. He soon afterwards broke out into revolt against Edward, and concluded a treaty with Queen Margaret, by which it was agreed that her son, Prince Edward, should espouse Anne Neville, W.'s daughter, and that in failure of issue, the crown should devolve on Clarence. King Edward escaped to Holland; and Henry VI. resumed the sovereignty. Edward, however, raised a body of Flemings and Dutchmen, and, landing near Hull, advanced towards London. He gave battle to King Henry's army, commanded by W., at Barnet, April 14, 1471. The battle was memorable and important. W. and his brother, Montague, were left dead on the field, and with them fell the greatness of the House of Neville. This fatal battle, followed by the decisive engagement of Tewkesbury, completed the defeat of the Lancastrians, and concluded the sanguinary War of the Roses. It appears (Fenn's *Letters*) that every individual of two generations of the great families of Warwick and Somerset fell on the field or on the scaffold, a victim of these sanguinary contests. W. is the most conspicuous personage of these disturbed times. He kept

open house wherever he resided, and daily fed at his various mansions 30,000. He loved turbulence for its own sake, and was ready to make or unmake any king, according to the caprice of the moment, and in order to shew his power.

WASH, a wide estuary on the east coast of England, between the counties of Lincoln on the north-west and Norfolk on the south-east, is about 22 miles in length, and 15 miles in average breadth. It is surrounded by low and marshy shores, and receives the rivers Witham, Welland, Ouse, Nen, and Nar. The estuary for the most part is occupied by sandbanks, dry at low water, and between these sandbanks are the channels through which the rivers mentioned flow into the North Sea. On both sides of the channel by which the Ouse falls into the sea, considerable tracts of land have been reclaimed. Anchorage is afforded to vessels by two wide spaces or pools of water, called respectively Lynn Deep, opposite the coast of Norfolk, and Boston Deep, opposite the Lincolnshire coast.

WASHING AND WASHING-MACHINES.

Although domestic washing is a simple enough process, yet it may be useful to give a brief description of the most efficient way of conducting it, in so far as experience and correct principles can guide such an operation. The first essential is suitable water, in other words, *soft* water. See WATER-SUPPLY. Yellow Soap (q. v.) being the kind chiefly used in washing linen, it is well to bear in mind that it is not desirable to purchase it very pale in colour, or very low in price. In order to gratify the desire for a light colour, soap-makers are obliged to reduce the strength of good dark soaps with adulterants; and it will give some idea of how easily the demand for cheapness may be met, to state, that hard soap, which should not contain so much as 25 per cent. of water, can be made with as much as 75 per cent. Soap, as is well known, improves by keeping. Soft or potash soap is sometimes used to wash coarse things, on account of its being stronger than hard soap, but its smell is objectionable. Soda is easily procured good; and with respect to washing-powders, as their merit depends on the amount of alkali which they contain, suffice it to say that to buy them is only a dear way of buying soda.

In arranging clothes for washing, it is desirable to sort them into kinds most suitable for washing together; such as lace, nets, and fine muslin into one heap; white body-linen into another; coloured things of the nature of prints and gingham into another; and so on. It is also desirable to wash clothes as soon as possible after they are soiled. Previous to washing, all white articles should be soaked for a night in cold water, in which a little soda has been dissolved, as the steeping in alkaline water greatly aids in removing all dirt of a greasy nature. The clothes should then be washed twice in clean tepid water with a sufficient supply of soap. If the water is quite cold, the dirt is taken off with difficulty; and if too hot, it is apt to fix it into the fibre of the cloth. The clothes should next be examined for spots or stains, so as to remove them, if possible, by an additional rubbing; after which they are boiled for at least 15 minutes in soap and water. Ink-stains or iron-moulds require to be taken out with oxalic acid, or the essential salts of lemon (oxalate of potash); and fruit-stains by boiling the stained parts with pearl-ash. After being boiled, the clothes are rinsed twice in cold water; and in the second rinsing, a little stone blue is added, to neutralise any yellowness occasioned by the washing. When this is done, they are wrung, and hung out to dry.

For the washing of flannels, it is even more desirable that the water should be soft than for linen or cotton; and it should contain no soda or potash in any form, as although a little alkali would more effectually remove dirt, yet it always turns woollens yellow, and at the same time thickens them. It is well to remember also that all rubbing, wringing, or squeezing tends to make woollen goods shrink, by facilitating their tendency to felt or mat into a thicker fabric. With respect to ladies' coloured dresses made of fine wool, such as merino, it is considered best to wash them in warm soft water with ox-gall, say a pint in a tubful of water. Ox-gall is a soap in its chemical nature, and it clears and brightens the colours.

The washing of printed cotton fabrics, especially muslins, has of late years become a difficult operation, on account of the fugitive nature of some of the dye-stuffs employed. The beautiful hues produced by the aniline or coal-tar colours, and by the archil lakes in imitation of them, have led to their being extensively used in calico-printing, as well as in the dyeing of silk and wool. These dyes can scarcely be said to be permanent on any fabric; but on cotton they require to be fixed by mordants, such as albumen (white of egg), which will scarcely stand washing at all, and to which hot water is utter destruction. The same thing is true of some other dyes, such as the light blue produced by artificial ultramarine. If economy is to be studied, it is far better to have printed dresses done in fast colours—the reds and purples, from madder, for example—as they, although less attractive at first, can be washed without injuring their appearance. All such articles should be washed in soft warm water; that which has been used for flannels, if not too dirty, will do. When thoroughly cleaned, rinse them well in clean cold water, and do not allow them to remain long in contact before they are hung up to dry.

White silk articles, as stockings and gloves, should be washed with soap, first in milk-warm, and afterwards in nearly boiling water. They will be improved if hung up for a short time in the fumes of burning sulphur (sulphurous acid) while still damp.

We have now to notice the domestic washing-machines which have, of late years, come into rather extensive use. A machine of this kind, when in motion, ought to produce at least as much agitation as will keep up a constant change in the deterring solution in contact with the linen, and at the same time cause the clothes to slide over each other in a somewhat analogous manner to hand-washing. There is an old form of washing-machine called the *dolly-tub*, which has been in use in Yorkshire for upwards of seventy years. It consists essentially of a presser or dolly, which is simply a round piece of wood, say ten inches in diameter, with from three to five legs rounded at the ends; the whole exactly resembling a footstool, but with the addition of an upright rod or spindle from its centre, with a cross piece at the top for working it. Any vessel, such as a tub, barrel, or box, may be used to hold the clothes, which are washed by moving the dolly first one way and then the other, at the same time a certain pressure being exerted on them against the sides and bottom of the vessel.

Of recent washing-machines, a certain class of them are modifications of the dolly-machine, with spring-ribbed boards, on which the linen is rubbed by a swinging motion. Another class consist of boxes which also oscillate upon an axis, but operate by jerking the clothes and water from side to side. A third, and perhaps the most efficient class are made upon the principle of the dash-wheel, so much

used in large bleach-works. In this machine, the materials to be washed are lifted by internal ribs on the rim of a large wheel, and allowed to fall with some force from fully half its height into the cleansing liquid—this being of course repeated as the wheel rotates.

The annexed figure shews a dash-wheel washing-machine for domestic purposes, by Messrs Summer-scales & Sons, Keighley, Yorkshire. The names of its separate parts are given in the references to the

Dash-wheel Washing-machine :

A, Drum inside of tub; B, Tub with cover removed; C, Tap to draw off water; D, Wooden rollers; E, Drip-board; F, Mangling-boards; G, Wheels to remove the machine; H, Oscillating motion for dash-wheel; I, Brushes for dirty clothes; K, Wheel thrown out of gear when mangling, in gear when washing.

letters, but we may explain that the linen is put inside the drum or dash-wheel, A (a sparr'd cylinder), which has a reciprocating action, so that, after making a complete revolution, it is reversed. The clothes are thus driven both ways through the water, and the quick reversing action of the machine gives them a jerk or dash at each change of motion—the equivalent of the fall from a large dash-wheel. There are brushes on the inside of the drum, which are brought into play if the clothes are coarse and dirty, but are turned out of action if they are of a fine description. A machine of this kind, 26 inches wide, will take in two pair of sheets or a dozen of shirts at a time, and by turning the handle with a brisk motion, they will be washed in eight or ten minutes. The lather for linen is made up with one pound of soap, half a pound of soda, and three quarts of water—the last being poured in boiling. Only about half as much soap is required as for washing by hand.

The wringing is performed by passing the wet clothes through the wooden rollers D, D, the upper one being temporarily covered with flannel to protect buttons, hooks and eyes, &c. from damage. The necessary pressure is obtained by means of the spring at J, and before turning the rollers, the washing-cylinder is thrown out of gear. With the aid of the mangling-boards, F, the clothes are mangled by these same rollers.

Washing by Steam, though little known in England, is practised to a considerable extent in France. The French chemist, Chaptal, first brought the process to perfection. Besides a saving of fuel, soap, and manual labour to the extent of at least one half, the wear and tear of the linen attending rubbing and beating is avoided. The efficacy of steam in washing depends upon its penetrating and dissolving property. The clothes are first steeped in a ley of soda or potash, or in a mixture of alkali and soap, and then hung in a wooden vessel kept full of steam by a pipe communicating with a boiler. On a small scale, a large caulk, made air-tight, will answer, and a common tea-kettle will produce steam enough. There must be an aperture to allow the air to escape when the steam first enters; the air being expelled, the aperture is shut. In half an hour, the dirt is sufficiently loosened to wash out with ease, and the linen is found to be extremely white.

WASHING OF FEET (called in Latin *Pedilavium*, and sometimes *Mandatum*, from the first word of the 'little chapter' in the service), one of the ceremonial observances of the Holy Week (q. v.) in the Roman Catholic Church. It forms part of the service of Holy Thursday, which day, from the word *mandatum*, is also called Maundy Thursday. The origin of this observance is extremely ancient. It is founded on the example and exhortation or precept of our Lord in John xiii. 5—14; and is traceable in the writings of Justin, Tertullian, Ambrose, and Augustine, as well as in many of the early councils. In some churches, however, or at least at some particular periods, the day fixed for the ceremonial was Good Friday, although for many centuries it has uniformly been assigned to Holy Thursday. It is necessary, however, to distinguish from the ceremonial of the Holy Week, another washing of the feet (also called *pedilavium*), which, in the case of catechumens, preceded baptism, and which, in many churches, was accompanied by a washing of the head, *captilavium*, and took place on Palm Sunday (q. v.), thence called 'Dominica Captilavii.' To this usage Sts Ambrose and Augustine distinctly refer. In the mediæval and modern church, the washing of feet has generally followed the solemn mass of the day. In those churches where the ceremony is still retained, the officiating bishop or priest, wearing a cope, and girt with a towel, and attended by a deacon and subdeacon, washes, dries, and kisses the right foot of a certain number of pilgrims, generally twelve, in memory of the twelve apostles; after which all the pilgrims are hospitably entertained, and served in person by the bishop, who distributes to each a dole in money or provisions. An appropriate service, consisting of a gospel (John xiii. 1—14) sung by the deacon, a chapter ('Mandatum novum') chanted by the choir, and a prayer by the bishop, accompanies the ceremonial. The washing of the pilgrims' feet on Holy Thursday forms a very striking part in the Holy Week ceremonial as carried out not only by the pope, but also by the bishops in most of the great cathedrals abroad. It was also practised by kings and other royal and noble personages, even down to a very recent date.

WASHINGTON, GEORGE, Commander-in-chief of the Continental forces in the war of the American revolution, and first President of the United States, was born in Westmoreland county, Virginia, February 22, 1732; son of Augustine Washington and his second wife, Mary Ball; a descendant of John Washington, who emigrated to Virginia from England about 1657, who was a grandson of John Washington, mayor of Northampton, and first

lay-proprietor of the Manor of Sulgrave, in Northamptonshire, who married a daughter of Shirly, Earl Ferrers. Lawrence, an elder brother of John, studied at Oxford; John resided at one time at South Cave, Yorkshire. Being royalists in the time of Cromwell, both emigrated, and became landed proprietors and planters in Virginia, in the district between the Potomac and Rappahannock rivers. Augustine Washington died when his second son George was 12 years old, leaving a large property to his widow and five children. His education in the indifferent local schools extended only to reading, writing, arithmetic, book-keeping, and land-surveying, then an important acquisition. He grew tall, had great physical strength, and was fond of military and athletic exercises. At the age of 13, he wrote out, for his own use, 110 maxims of civility and good behaviour. In 1740, his elder brother, Captain Lawrence Washington, served under Admiral Vernon in the expedition against Carthage, and named his residence on the Potomac Mount Vernon, in honour of his commander, who offered George a commission as midshipman on his ship, which, but for the opposition of his mother, he would have gladly accepted. He then spent his time chiefly with his brother at Mount Vernon, and with Lord Fairfax, who owned great estates in the Virginia valley; and in 1748, he engaged to survey these wild territories for a doubleloon a day, camping out for months in the forest, in peril from Indians and squatters. At the age of 19, at the beginning of the Seven Years' War, he was appointed adjutant of the provincial troops, with the rank of major; in 1751, he made his only sea voyage—a trip to Barbadoes—with his brother Lawrence, who died soon after, and left George heir to his estates at Mount Vernon. At 22 (1754), he commanded a regiment against the French, who had established themselves at Fort Duquesne (now Pittsburg), and held Fort Necessity against superior numbers, until compelled to capitulate. The year following, when two regiments of regulars were led against Fort Duquesne by General Braddock, W. volunteered; and at the disastrous ambuscade of July 9, 1755, he was the only aide not killed or wounded. He had four bullets through his coat, and two horses were shot under him. The Indians believed that he bore a charmed life, and his countrymen were proud of his courage and conduct. Two thousand men were raised, and he was selected to command them. In 1759, he married Mrs Martha Custis, a wealthy widow, resigned his military appointments, and engaged in the improvement of his estates, raising wheat and tobacco, and carrying on brick-yards and fisheries. He was, like nearly all Americans of property at that period, a slaveholder, and possessed at his death 124 slaves, whom he directed, in his will, to be emancipated at the death of his wife (who survived him but three years), so that the negroes of the two estates, who had intermarried, might not be separated. He was for some years a member of the Virginia Assembly; and in 1774, though opposed to the idea of independence, and in favour of the union with Great Britain so ardently desired by all British Americans, he was ready to fight, if necessary, for the constitutional rights of the colonists. He spoke seldom and briefly; but Patrick Henry declared him to be, 'for solid information and sound judgment, unquestionably the greatest man in the assembly.' The news of the battle of Lexington (April 19, 1775) called the country to arms; and W., then a member of the Continental Congress, was elected Commander-in-chief by that body. He hastened to the camp at Cambridge; compelled the evacuation of Boston;

was driven from New York; compelled to retreat across New Jersey; often defeated, and reduced to the most desperate straits, by disaffection, lack of men and supplies, and even cabals against his authority; but by his calm courage, prudence, firmness, and perseverance, he brought the war, with the aid of powerful allies, to a successful termination; and (Dec. 23, 1783), the independence of the thirteen colonies achieved, he retired from the army to Mount Vernon, which he had, during the eight years of the war, but once visited. He refused pay, but kept a minute account of his personal expenses, which were reimbursed by Congress. In 1784, he crossed the Alleghanies to see his lands in Western Virginia, and planned the James River and Potomac Canals. The shares voted him by the state he gave to endow Washington College, at Lexington, Va., and for a university. The Federation of States having failed to give an efficient government, W. proposed conventions for commercial purposes, which led to the Convention of 1787, of which he was a member, which formed the present federal constitution, considered by him as the only alternative to anarchy and civil war. Under this constitution he was chosen president, and inaugurated at New York, April 30, 1789. With 'Lady Washington,' so termed by the courtesy of the period, he presided over a federal court, far more formal and elegant than exists at this day, and made triumphal progresses in the north and south. During his second term of office, he was disgusted by the opposition of the Republican party, under the leadership of Jefferson and Randolph, and refusing a third election, he issued, in 1796, his farewell address, and retired to Mount Vernon. In 1797, when there arose a difficulty with France, threatening hostilities, he was appointed lieutenant-general and commander-in-chief. On the 12th of December 1799, he was exposed in the saddle, for several hours, to cold and snow, and attacked with acute laryngitis, for which he was repeatedly and largely bled, but sunk rapidly, and died, December 14. His last words were characteristic. He said: 'I die hard; but I am not afraid to go. I believed from my first attack that I should not survive it. My breath cannot last long.' A little later he said: 'I feel myself going. I thank you for your attentions; but I pray you to take no more trouble about me. Let me go off quietly. I cannot last long.' After some instructions to his secretary about his burial, he became easier, felt his own pulse, and died without a struggle. He was mourned even by his enemies, and deserved the record: 'First in peace, first in war, and first in the hearts of his countrymen.' W. was 6 feet 2 inches high, with brown hair, blue eyes, large head, and strong arms; a bold and graceful rider and hunter; attentive to his personal appearance and dignity; gracious and gentle, though at times cold and reserved; childless, but very happy in his domestic relations and his adopted children—nephews and nieces. His best portraits are those by Stuart, and the statue by Houdin at Richmond. He was an exemplary member of the Church of England.—See art. UNITED STATES; also Sparks's *Life and Writings of Washington*, 12 vols. 8vo (Boston, 1834—1837); *Life of Washington*, by Chief-justice Marshall, 5 vols. 8vo (Philad. 1805); *Life of Washington*, by Washington Irving, 5 vols. 8vo (New York, 1855—1859); &c.

WASHINGTON, a territory of the U. S., in lat. 45° 30'—49° N.; long. 117°—125° W.; bounded N. by British Columbia, E. by the territory of Idaho, S. by the Columbia River, which separates it from Oregon, W. by the Pacific Ocean. Estimated area, 71,000 square miles. Its capital is Olympia, at the

head of Puget Sound; Vancouver, Wallawalla, Cascade City, and other new towns, with a multitude of mining villages and camps, are scattered over the territory. The chief rivers are the Columbia or Oregon, on the southern border, which also drains the whole territory east of the Cascade Mountains; the Okonagan, its great northern branch, flowing from the lake of the same name in British Columbia; Lewis or Snake River, and numerous streams emptying into Puget's Sound and the Pacific. W. is rich in sounds and harbours. Puget's Sound, from 1 to 4 miles wide, and 8 fathoms or more in depth, opens out of the Strait of Juan de Fuca, penetrating 100 miles into the heart of the country, and with its bays and islands forming one of the finest collections of harbours in the world. Hood's Canal, a narrower channel on the west, extends 60 miles. Bellingham, on the eastern shore of the Gulf of Georgia, has a tide of 20 feet. There are also large and deep harbours, suitable for naval stations, on the Strait of Juan de Fuca. The great range of Cascade Mountains, a continuation of the Sierra Nevada, passes through the centre of the territory from north to south, about 100 miles from the coast. Its chief summits are Mount Baker, lat. 48° 44', 11,900 feet, an active volcano; Mount Rainier, lat. 46° 40', 12,330 feet, an extinct volcano; Mount St Helen, 9550 feet, nearly extinct; Mount Adams, 9000 feet, entirely extinct. East of the Cascade Mountains, the soil is thin, rocky, dry, and sterile, but with fertile valleys; on the west, and especially around Puget's Sound, the soil is rich, and the country covered with a dense ever-green forest. West of the Cascades, the formation is of tertiary sandstone; near the Sound, the alluvium has a depth of 100 feet. Lignite, or tertiary coal, is found in many places. The mountains are granitic, and near Mount Adams is a large field of lava. East of the Cascade Mountains, the formations are igneous and metamorphic, with trap and volcanic scoria. There are rich gold-diggings in the north-eastern portion. The climate in the western district is almost precisely that of England, with a rainfall of 53 inches; east of the mountains, there is but a quarter of the rainfall, and extremes of heat and cold. The timber in the western district is of great richness and abundance; the red fir and yellow fir (*Abies Douglasii* and *A. grandis*), growing 300 feet high, and 6 to 8 feet in diameter. The vegetable and animal productions are the same as in Oregon. Fish are very abundant, a dozen species of salmon filling all the streams, with halibut, cod, herrings, and sardines in great quantities. The water and mountain scenery is among the finest on the continent. The chief product is timber, of which 20,000,000 feet were exported in 1860. Steam saw-mills on Puget's Sound and Hood's Canal saw 40,000,000 feet per annum. Wheat, barley, oats, potatoes, and the hardier fruits, are produced in abundance. This territory was discovered by Juan de Fuca, a Greek, in 1592; visited by a Spanish navigator in 1775, and three years after by Captain Cook. In 1787, Berkeley, an Englishman, re-discovered the Strait of Fuca, which had been missed by others. Captain Gray, an American, visited the coast in 1791; and the English Captain Vancouver in 1792; Captains Lewis and Clark explored the interior during the presidency of Jefferson, and settlements were made by the Hudson's Bay Company in 1828; in 1845, American settlers entered the territory, then a part of Oregon. Wars with the Indians, in 1855 and 1858, retarded immigration, but in the latter year, 15,000 persons were attracted by the discoveries of gold-diggings at Fraser's River, many of whom became permanent settlers. The white pop.

in 1860 was 11,594; Indians variously estimated at 10,000 to 30,000.*

WASHINGTON CITY, the seat of the government of the U. S. of America, is in the district of Columbia, on the left bank of the Potomac River, between Anacostia River and Rock Creek, which separates it from Georgetown, lat. 38° 51' 20" N., long. 77° 0' 15" W., 39 miles south-west of Baltimore, 136 from Philadelphia, 226 from New York, 120 north-east of Richmond, 1203 from New Orleans, 2000 from San Francisco, 160 above the mouth of the Potomac, and 300 from the Capes of the Chesapeake. The Potomac at W. is one mile wide, and of sufficient depth for the largest vessels. The city was laid out under the direction of General Washington, on a handsome scale for the national capital, on a plateau 40 feet above the river, with several elevations, with streets from 90 to 120 feet wide, and 20

avenues, 130 to 160 feet. The principal edifices are the Capitol; the White House, residence of the president; Patent Office; General Post-office; Treasury, War, and Navy Departments; Smithsonian Institute (q. v.), &c. The Capitol, on the summit of a gentle elevation, in a pleasure-ground of 35 acres, was commenced in 1793, burnt by British troops in 1814, completed in 1825, and extended by the addition of two spacious wings in 1851; the centre is 352 feet by 101, with a lofty dome; the wings, 142 by 238 feet; the entire building being 751 feet long, 324 deep, covering 3¼ acres—the centre of white sandstone, the wings white marble. The Rotunda, under the dome, contains several national pictures by Trumbull, Weir, Vanderlyn, Powell, Chapman, &c. The Senate Chamber is a noble hall, 112 by 82 feet, with galleries for 1000 spectators; the Hall of Representatives is 139 by 93 feet, with

The Capitol at Washington.

galleries for 1200. The old Senate and Representative Chambers, used before the enlargement, are beautiful rooms. The Congressional Library is 91 by 34 feet, with 70,000 vols., besides 80,000 vols. of documents. The Capitol, containing also numerous committee-rooms and offices, is highly ornamented with rich marbles, frescoes, and groups of statuary. The buildings of the Treasury and State Departments, Post-office, &c. are massive and spacious. The saloons of the Patent Office, filled with models, are 1300 feet in length. A monument to Washington, intended to be 600 feet high, is one-third built. The city also contains numerous large hotels, 50 churches, a Roman Catholic and a Baptist college, three daily and several weekly newspapers, academies, schools, &c. The public buildings alone, however, are spacious and costly, the city in general having a scattered and mean appearance. During the War of Secession, from its exposed position, it was threatened with capture, and was surrounded by fortifications, and converted into an entrenched camp. Pop. in 1860, 61,118.

WASHITA, a river of the U. S. of America, rises on the western borders of Arkansas, and runs east and south-east through Louisiana, emptying into the Red River, 30 miles from its mouth; it is 500 miles long, and navigable to Camden, 300. Its chief branches are the Saline River, La Fourche, Tensas, and Little Missouri.

* The eastern and larger portion of the W. Territory of 1860, is now included in the newly erected territories of Idaho and Montana.

WASHOE SILVER MINES, a rich deposit of siliceous argentiferous galena, discovered in 1859 in a range of hills on the east side of the Sierra Nevada, on the borders of California and Nevada Territory, near the sources of Carson's River, 160 miles east by north of Sacramento. The ore produces as much as 2000 dollars to the ton, and is largely exported to England. The discovery of these mines caused a great excitement in California, and a large emigration.

WASP (*Vespa*), a Linnean genus of insects, now forming the family *Vespidæ*, a very numerous and widely distributed family, of the order *Hymenoptera* and section *Aculeata*. They are distinguished from all the other *Hymenoptera*, by their wings, when at rest, being folded throughout their entire length. The wings of all the wasps exhibit a similar pattern of nervation, with one marginal and three submarginal cells, and an incomplete terminal submarginal cell. Their antennæ are usually angled, and somewhat club-shaped at the extremity. The maxillæ are long and compressed; there are glands at the extremity of the labrum; the tongue is trifid, its tips lacinated. The body is naked, or but slightly hairy. The general appearance resembles that of bees; the colour is usually black, with yellow markings. The division between the thorax and abdomen is very deep, the abdomen often stalked. The legs are not fitted for collecting pollen, like those of bees. The females and neuters have stings, generally more formidable than those of bees. The larvae have tubercles instead of feet. The wasps differ very widely in their habits, some being solitary, the

family *Eumenids* of some entomologists; others social, to which the name *Vespidæ* is sometimes restricted. Neuters are only found among the social wasps. Some of the solitary wasps make curious burrows in sand, or construct tubes of earthy paste on the sides of walls, in which they form cells for their eggs, at the same time placing there a store of food for the larvæ, some of them using for this purpose perfect insects, others caterpillars, which are stung so as to be rendered incapable of motion without being killed. Others make little earthen cells on the stems of plants, and store in them a little honey for their young. The social wasps have various modes of constructing their nests, which are sometimes formed in excavations in the ground, sometimes attached to walls, boughs of trees, &c., and formed of a paper-like, or sometimes a paste-board-like substance, produced by mixing into a pulp, with their saliva, small particles of woody fibre, torn by their broad and powerful mandibles from gate-posts, palings, the bark of trees, &c. Great diversities are to be seen in the arrangement of the combs within the nest. The combs are made of a substance similar to the outer covering of the nest, but generally thicker and firmer. As the nest is enlarged, new paper is made for the purpose, the whole nest being enclosed in the last-made envelope, and the inner ones, which sufficed for its former size, are removed to give place to combs. Several inner envelopes are generally found in a *W.*'s nest, so that paper-making must be a great part of the industry of these insects. The nests of the wasps of tropical countries are often very large, sometimes six feet long, and the communities very numerous. In colder regions, the increase of the community and of the nest is arrested by the approach of winter, when the males and the neuters die; but a few of the females survive, passing the winter in a torpid state in some retreat, and found new communities in spring. In a community of wasps there are many perfect females—not a single queen, as in the case of hive bees. Wasps in their perfect state feed very

Nests of Various Species of Wasps:
1, *Vespa crabro*; 2, *V. holstetica*; 3, *V. vulgaris*.

indiscriminately on a great variety of animal and vegetable substances, as insects, flesh, fruit, sugar, &c. Grapes or gooseberries, especially if over-ripe, are often found to contain a *W.* in the interior. Wasps often invade bee-hives and steal honey. There is a Brazilian species (*Myropetra scutellaris*) which stores up honey like bees. Wasps may be killed by

pouring hot water on their nests; but more easily by the vapour of burning sulphur, when the nests are not in the ground; or ether or chloroform may be used to stupefy the wasps, so that the nest may be safely destroyed. The largest British species of *W.* is the Hornet (q. v.), found only in the south of England. The most abundant species, diffused over all parts of the country, are *Vespa vulgaris* and *V. media*. The former is about eight lines long. The front of the head is yellow, with a black centre; there are many yellow spots on the thorax, and a yellow band with black points at the posterior margin of each ring of the abdomen; the rest is black. *V. media* is very similar, but rather larger. *V. vulgaris* makes its nest in the ground; *V. media* suspends it generally to the branches of trees, but sometimes to the projections of walls.

WASTE, in English Law, has several meanings. (1.) It means a common belonging to a manor, and by analogy is often applied to pieces of land of no great value, lying at the sides of highways or the seashore. The presumption is that a strip of land adjoining a highway belongs to the owner of the land next to it. (2.) Waste also means the spoil or destruction to houses, gardens, trees, or other corporeal hereditaments, committed by tenants for life or for years, to the injury of the remainderman or reversioner. Thus, he who has a life estate, or an estate for years, in a house or land, cannot change the nature of things, as by turning meadow into arable, nor wood into pasture, though he may better a thing of the same kind, as by draining the meadow, &c. The alteration caused by thus diminishing an inheritance is called waste, and its characteristics are to diminish the value of the inheritance, or to increase the burden upon it, or to impair the evidence of title. Waste is either voluntary or permissive. The former consists in the commission of acts which the tenant has no authority to do—such as pulling down buildings, felling timber, or opening mines. Permissive waste arises from the omission of acts which it is the tenant's duty to do—as, for example, suffering buildings to go to decay by wrongfully neglecting to repair them. There is, however, incident to every estate for life or years, the right to take estovers—that is, so much wood, stone, &c., as is required for use on the tenement, for repairs, husbandry, and the like purposes. It is a common practice, in family settlements, to provide that, in addition to this privilege, the estates of the tenants for lives shall be without impeachment for waste. The effect of this clause is to enable the tenant to take timber, minerals, &c., severed by himself or others during the continuance of his estate. But even where the tenant holds without impeachment of waste, he is not entitled to cut down ornamental timber; and if he do so, a court of equity will restrain him by injunction. Wherever the tenant is committing acts of a character especially destructive to the inheritance, or still more, acts of wanton or malicious mischief, the Court of Chancery holds that his legal power to commit waste is being used unconscientiously, and will restrain him.

WASTE LANDS, according to the general use of the term, are uncultivated and unprofitable tracts in populous and cultivated countries. The term waste lands is not employed with reference to land not reduced to cultivation in countries only partially settled. There is a large extent of waste lands even in the British Islands. Of the 74,000,000 acres which they contain, only about 42,000,000 are arable land and improved pasture; 2,000,000 acres are occupied with woods and plantations; 7,000,000 acres in Scotland consist of sheep-pasture, generally at a considerable elevation, and little improved by art;

8,000,000 acres in Ireland are unenclosed pasture, generally quite unimproved; 3,000,000 acres are mountain and bog; and 12,000,000 acres consist of unimproved and very unproductive land of other kinds.

The improvement of waste lands is very much a question of expense. It is often more profitable to improve lands already cultivated, and to bring them into a higher state of cultivation and productivity, than to reclaim waste lands; in attempting which, much money has often been lost. Much of the cultivated land of Britain is far from having been brought to the highest state of cultivation of which it is evidently capable, or to a state equal to that of the best cultivated lands of similar soil and situation. In many instances, however, waste lands have recently been improved with great advantage, and it seems probable that no small part of the waste lands of the country are capable of profitable improvement. The process must often be slow and gradual, especially where the soil is naturally very poor, as even the addition of large quantities of manure to very poor soils will not render them fertile, but on the contrary will be followed by a sterility greater than before. The quantity of guano which a rich soil would gratefully receive, will destroy every vestige of vegetation on a very poor soil.

The waste lands of Britain are of very various character. Some of them are bogs, already sufficiently noticed in the article Bog. Others are marshes and fens, generally very near the level of the sea, and often within the reach of its tides, chiefly in the eastern counties of England. See BEDFORD LEVEL. Of these, a great extent has been reclaimed, and has become very productive; much still remaining, however, to be done. There are also extensive moors both in England and in Scotland, often of very poor soil, and often also at such an elevation above the level of the sea, as to render profitable agriculture hopeless. This is not the case with all the moors, and it is sometimes possible to effect great improvement by drainage; so that land, formerly almost worthless, may be converted into good pasture. In many places, the heath has been extirpated, and the moorland changed into good pasture, and even into good arable land. It is sometimes found very profitable to break up such land, even at very considerable elevations, and afterwards to lay it down in pasture, the produce being much greater than it was before. Even in the most elevated tracts, drainage is beneficial; although it must always be considered whether or not drainage will pay. The highest sheep-pastures of the south of Scotland have been greatly improved by a kind of superficial drainage (*sheep-drains*), consisting of mere open channels for water; but in the greater altitudes of the Highlands, and amidst their more rugged steeps, even this is out of the question. In some cases, chiefly of the more level moorlands, much improvement is effected by *paring and burning*, the surface being parted off by the *breast-plough* or *paring-spade*, and burned, generally in heaps, of which the ashes are spread upon the soil. The application of lime is of great benefit in many cases, as is also that of chalk and of marl, but the expense must always be considered, and many tracts of waste lands are so situated that the application of such manures is impossible. Railways have rendered the reclamation of waste lands profitable in many districts, in which formerly it would not have been so.—The chalk *downs* of the South of England may, in great part, almost be considered as waste lands, although used for sheep pasture; but they have been found capable of great improvement, although in a slow and gradual manner, by tillage,

and the application of manures.—Sands near the sea-shore are fixed by sowing certain grasses (see AMMOPHILA), and are capable of further improvement by cultivation and the application of manures; particularly where the sand is in considerable part calcareous. The most barren and hopeless sands are those which are almost entirely siliceous. An experiment, on a very large scale, is now in process of being made, on a sand of this kind, on the coast of Essex, by applying to it the sewage of London. Very different opinions have been expressed by scientific men, as to the probable result of the experiment. Liebig deems the siliceous sand incapable of profiting by the rich manure poured upon it. The experiment is one of importance, not only as to the reclamation of waste lands, but as to the great question of the disposal of the sewage of towns.

WASTING PALSY is one of the terms applied to the disease described in this work under its old name of TABES DORSALIS.

WATCH, a small portable machine for measuring time, the construction of which is essentially the same as that of a clock (see HOROLOGY), except that the moving power is obtained from the elastic force of a coiled spring instead of from a weight, and the movement regulated, so as to be isochronous, by a Balance and Balance-spring (q. v.) instead of a pendulum. The going part of a watch consists of a train of wheels and pinions, kept in motion by a spring, called the main-spring; the last and fastest wheel of the train, the scape-wheel or balance-wheel, acting so as to keep in vibratory motion a balance whose movement, again—which is made isochronous by the action of another spring called the balance-spring—regulates to a uniform rate the revolution of the scape-wheel, and consequently the motion of the rest of the train, and the uncoiling of the main-spring.

The main-spring is a thin ribbon of steel coiled in a barrel. The inner end of it is fixed to a strong spindle, the axis or *arbor* of the barrel, around which it is coiled, and the outer end is fixed to the inside of the barrel. By its tendency to uncoil itself, the spring sets the barrel in motion, and it produces as many revolutions of the barrel as it makes turns itself in uncoiling (fig. 1). As its elastic force is greater when it is tightly coiled than when it has to some extent unwound itself, the spring, if its force were applied without modification to the watch-train, would act upon it unequally, the power exerted diminishing as the spring uncoiled; so much so, that the watch could not go uniformly throughout the day, though it might keep time from one day to another. A piece of machinery, called a fusee, is employed to correct the variations in the force of the spring, and equalise the power exerted upon the train. The fusee is a cone with a spiral groove, connected with the barrel which contains the main-spring by a chain, one end of which is fixed at the broadest part of the cone, and the other end to the barrel (fig. 2). The barrel moves the fusee by means of the chain, which, as it runs off the sides of the fusee, is coiled upon the outside of the barrel. In winding a watch the key is placed on the axis of the fusee, and by the same movement the main-spring is coiled around its spindle, and the chain wound off the barrel, to cover the cone of the fusee. So when the spring is all coiled up, and its force upon the barrel is greatest, the chain is acting at the small end of

Fig. 1.

the fusee, and its leverage upon the fusee is least; as the force of the spring diminishes, the chain having got to a broader part of the fusee, the leverage is increased; and the grooving of the fusee being,

Fig. 2.

when perfect, arranged so that a section of the fusee along its axis would present two hyperbolas placed back to back, secures that the force of the spring, modified by the leverage of the chain, shall produce a uniform motion of the fusee. From the fusee this motion is communicated to the watch-train, the first wheel of the train—called the fusee-wheel or the great wheel—being set upon the fusee. The fusee is introduced in almost all English watches; but a great proportion of foreign watches, and most French spring clocks, have no fusee, and have the great wheel fixed on to the barrel. Accurate time-keeping is not to be looked for from such clocks or watches; but it is said that many of the main-springs made upon the continent are so skillfully contrived, that the force is pretty constant during the whole time of unwinding.

Between the train of wheels and pinions in a watch and that of a clock, until we come to the escapement, there is no difference, except that there is one more wheel and pinion in the watch-train than in the clock-train; the reason of which is, that the scape-wheel of a watch revolves, not like that of a clock, in a minute, but usually in about six seconds, making necessary an additional wheel to revolve in a minute and carry the seconds hand. A great variety of watch escapements are in use. The oldest, which is now going out of use, is the vertical escapement. It exactly corresponds to the crown-wheel escapement in clocks (see HOROLOGY). The accompanying figure shows a watch-train with this escapement. It may be useful also as indicating, in a general way, the arrangement of the wheel-work in a watch (fig. 3). The main-spring contained in the barrel B, sets in motion

Fig. 3.

the barrel, which, by means of the chain *c*, moves at a uniform rate the fusee *F*, along with which turns the fusee-wheel *W*, the first or great wheel of the watch-train. It will be easily seen how, from the great wheel, motion is communicated successively to the centre-pinion *D*, and the centre-wheel *D'* (which turn in an hour); to the third-wheel pinion, *E*, and the third wheel, which is upon the same arbor, *E'*; and to the fourth or contrate-wheel pinion *G*, and the contrate-wheel *G'*. The upright teeth of the last-named wheel move the balance-wheel pinion *H*, and with it the balance-wheel or scape-wheel *H'*, which is fixed upon its arbor. The scape-wheel (and in this escapement the contrate-wheel also) is what is called, from its shape, a crown-wheel. Upon the arbor or verge of the balance *K*, are two pallets, *p, p*, at a distance from each other, equal to the diameter of the scape-wheel, and so

placed that, as the scape-wheel revolves, its teeth give them alternately an impulse in different directions, which keeps up the vibratory motion of the balance. The balance is made to vibrate isochronously by the action of the Balance-spring (*q. v.*); and its vibration regulates the escape of the teeth of the scape-wheel, and so the motion of the whole train, exactly as that of the pendulum does in an ordinary clock. The vertical escapement is liable, though in a less degree, to the same objection as the old crown-wheel and the crutch or anchor escapements in clocks. There is a recoil of the scape-wheel after one of its teeth has been stopped by a pallet, which interferes more or less with the accuracy and uniformity of the motion of the train. See HOROLOGY.

Almost immediately after the invention of the balance-spring, attempts began to be made to introduce an escapement which would produce greater accuracy than the vertical escapement. Hooke, Huygens, Hanteville, and Tompion introduced new principles, each of which has since been successfully applied, though they all, from imperfect execution, failed at the time. The first real improvement was made by George Graham, the inventor of the dead escapement in clocks (fig. 4). This is called the horizontal escapement; it was introduced in the beginning of the last century, and it is still the escapement used in most foreign watches.

Fig. 4.

The impulse is given to a hollow cut in the cylindrical axis of the balance, by teeth of a peculiar form projecting from a horizontal crown-wheel. Other forms of escapement in high estimation are the lever escapement, originally invented by Berthoud, improved by Mudge; the duplex escapement, the principle invented by Hooke, the construction perfected by Tyrer; and the detached escapement of Berthoud, improved by Arnold and Earnshaw. The last-mentioned is that which is employed in marine chronometers and in pocket-chronometers, as watches made in all respects like chronometers are called. The lever escapement is that which is used in most English watches. In it the scape-wheel and pallets are exactly the same as in the dead escapement in clocks. See HOROLOGY.

The pallets, *p, p* (fig. 5) are set on a lever which turns on their arbor, *A*; and there is a pin, *B*, in a small disc on the verge or arbor of the balance, which works into a notch at the end of the lever. The pin and notch are so adjusted, that when a tooth of the scape-wheel has got free, the pin slips out of the notch, and the balance is detached from the lever during the remainder of its swing; whence the name *detached* lever escapement, originally applied to this arrangement. On the balance returning, the pin again enters the notch, moving the lever just enough to send the tooth next in order to escape from the dead face of the pallet on to the impulse face; then the scape-wheel acts upon the lever and balance; the tooth escapes, and another drops upon the dead face

Fig. 5.

of the pallet, the pin at the same time passing out of the notch in the other direction, leaving the balance again free. This arrangement is found to give great accuracy and steadiness of performance. To prevent the teeth from slipping away while the balance is free, the faces of the pallets are slightly undercut, and this makes them secure while at rest; moreover, there is a pin on the lever which moves through a notch on the balance disc, while the pin, B, moves through the notch in the lever, which is so adjusted as to guard against the lever moving and the teeth escaping, while the balance is free.

In watches, even more than in clocks, variations of temperature, unless provided for, produce variations in the rate of going, the increase or diminution of the temperature affecting to some extent the moment of inertia of the balance, and to a great extent the elastic force of the balance-spring. A rise in the temperature makes the balance expand, and therefore augments its moment of inertia; it adds to the length of the spring, and thereby diminishes its elasticity, the elastic force of a spring varying inversely as the length; and the time of vibration of the balance, which depends upon the moment of inertia directly, and upon the elastic force of the spring inversely, is increased—the watch, that is, goes more slowly—in consequence both of the increase of the inertia and of the diminution of the elastic force of the spring. A fall in the temperature is attended by opposite results, the watch going more rapidly than before. A watch without a compensated balance would vary very much more than a clock without a compensation pendulum, but that being usually carried in the waistcoat pocket, it is kept at a pretty uniform temperature. To invent a satisfactory compensation was at one time the great problem for watchmakers. The compensation can obviously be made in either of two ways—by an expedient for shortening the effective length of the balance-spring as the temperature rises, so as to increase the elastic force of the spring; or by an expedient for diminishing the moment of inertia of the balance as the temperature rises, so as to correspond to the diminution of the force of the spring. The first method was that made use of by John Harrison (q. v.), who first succeeded in making a chronometer capable of measuring time accurately in different temperatures; but an adaptation of the other method,

Fig. 6.

The brass bar expands more with heat, and contracts more with cold than the steel bar; therefore, as the temperature rises, the bars, with their weights, bend inwards, and so the moment of inertia of the balance is diminished; as it falls, they bend outwards, and the moment of inertia is increased; and of course the diminution or the increase must be made exactly to correspond to the diminution or increase in the force of the spring.

The chronometer is just a large watch fitted with

all the contrivances which experience has shewn to be conducive to accurate time-keeping—a g., the cylindrical balance-spring, the detached escapement, and the compensation-balance. As a watch which will keep time in one position will often not do so equally well in another, marine chronometers are always set horizontally in a box in *Gimbals* (q. v.), an arrangement which keeps the chronometer horizontal, whatever the motion of the vessel.

The great importance of an accurate portable time-keeper at sea is for determining the Longitude (q. v.). This use was first distinctly pointed out by Sir Isaac Newton. A committee of the House of Commons, of whom this philosopher formed one, having been appointed on the 11th June 1714, to consider the question of encouragement for the invention of means for finding the longitude, the result of their meetings was a memorial containing an explanation of the different means proper for ascertaining the longitude, and recommending encouragement for the construction of chronometers as the best means of ascertaining it. An act of parliament was then passed, offering a reward for this purpose.

The first chronometer used at sea was invented by John Harrison. After many years of study it was completed in 1736. After several further trials and improvements, and two trial voyages to America, undertaken for the satisfaction of the commissioners, the last of which was completed on the 18th September 1764, the reward of £20,000 was finally awarded to Harrison.

Somewhat later than this, several excellent chronometers were produced in France by Berthoud and Le Roy, to the latter of whom was awarded the prize by the Académie Royale des Sciences. Progress was still made in England by Arnold, Earnshaw (the inventor of the compensation still in use), and Mudge, to whom prizes were awarded by the Board of Longitude, and under whom a perfection nearly equal to that of the present day was obtained. The subsequent progress of watch-making has been chiefly directed to the construction of pocket-watches on the principle of marine chronometers, or to the combination of accuracy with convenient portability. The adjusted lever watch is now made in Clerkenwell with a degree of accuracy which enables the performance to be warranted within an error of one second a day.

While the compensation of a chronometer can never be made perfectly accurate for all degrees of temperature, there are always two temperatures at which a well-constructed chronometer will go with perfect accuracy. The explanation of this lies in the fact that while the variations of elastic force in the spring go on uniformly in proportion to the rise or fall of the temperature, the inertia of the balance cannot be made to vary as it should do, in exact correspondence to them inversely. The variation of the elastic force may be represented by a straight line inclined at some angle to a straight line divided into degrees of temperature; the corresponding changes of the moment of inertia will be represented by a curve, and this curve can coincide with the straight line representing the variations of elastic force only at two points, corresponding to two different temperatures. The particular points in the case of any chronometer are matter of adjustment. For instance, one chronometer may be made to go accurately in a temperature of 40°, and also in a temperature of 80°, at other temperatures being not so accurate; another chronometer to go accurately at a temperature of 20° and of 60°. It is manifest that the former would be adapted to voyages in a warmer, the latter to voyages in a colder climate. Apparatus for testing chronometers have been long in use in the observatories at Greenwich

and Liverpool. In the latter, there is now an extensive apparatus for this purpose, devised by the ingenious astronomer, Mr Hartaup. In a room which is isolated from noise and changes of temperature, the chronometers are arranged on a frame under a glass case, so contrived that they may be subjected in turn to any given degree of temperature. The rate of each under the different temperatures is observed and noted, and the chronometers registered accordingly. These observations are of the greatest importance both to ship-captains and instrument-makers, who can have their instruments subjected to the observations on payment of a fee.

It may be stated that the main-spring had been employed as the moving force of time-keepers for about a century before the invention of the balance-spring; but very little is known about the action of these forerunners of the watch. A watch without a balance-spring must have been a very rude and untrustworthy contrivance. The honour of first proposing the balance-spring is undoubtedly due to our countryman, Dr Hooke, though Huygens and De Hautefeuille also invented it independently about the same time.—See *Rudimentary Treatise on Clocks and Watches*, by E. B. Denison, Q.C.; Wood's *Curiosities of Clocks and Watches*.

WATCH, on Shipboard, a division of the crew into two, or if it be a large crew, into three, sections; that one set of men may have charge of the vessel while the others rest. The day and night are divided into watches of four hours each, except the period from 4 to 8 P.M., which is divided into two *dog-watches* of two hours' duration each. The object of the dog-watches is to prevent the same men being always on duty at the same hours.

WATCHING AND WARDING, in Scotch Law, mean the services rendered by one who holds lands under burgage tenure. These services are merely nominal.

WATCH-RATES, in England, are the rates authorised to be levied in a parish or borough under the Watching and Lighting Act, 3 and 4 Will. IV. c. 90, for the purpose of watching and lighting the parish.

WATER (symb. HO,* equiv. 9, spec. grav. 1), in a state of purity, at the ordinary temperature of the air, is a clear, colourless,† transparent liquid, perfectly neutral in its reaction, and devoid of taste or smell. At a temperature below 32° it freezes, crystallising in various forms derived from the rhombohedron and six-sided prism. See ICE; SNOW; FUSING AND FREEZING POINTS; HEAT. It appears from the researches of Arago and Fresnel, that notwithstanding the gradual dilatation of water below 39°, its refractive power on light con-

tinues to increase regularly, as though it contracted. Its density at 60°, and at the level of the sea, is taken at 1.000, and forms the standard of comparison for all solids and liquids, hydrogen being similarly taken as the standard of comparison for gases and vapours. Distilled water is 815 times heavier than air; a cubic inch weighs, in air at 62°, with the barometer at 30 inches, 252.458 grains, and *in vacuo*, 252.722 grains, the grain being $\frac{1}{7000}$ of the avoirdupois pound. See AVOIRDUPOIS, GALLON. For all practical purposes, water may be considered as incompressible; but very accurate experiments have shewn that it does yield to a slight extent when the pressure employed is very great; the diminution of volume for each atmosphere of pressure being about 51-millionths of the whole.—See Miller's *Chemical Physics*, 3d ed. p. 41. Water evaporates at all temperatures, and under the ordinary pressure of the atmosphere, boils at 212°, passing off in the form of steam, which, in its state of greatest density at 212°, compared with air at the same temperature, and with an equal elastic force, has a spec. grav. of 0.625. In this condition it may be represented as containing, in every two volumes, two volumes of hydrogen and one volume of oxygen. See BOILING, STEAM, VAPOUR.

Water is the most universal solvent with which the chemist is acquainted, and its operations in this respect are equally apparent, although on very different scales, on the surface of the globe and in the laboratory. This solvent action is usually much increased by heat, so that a hot aqueous saturated solution deposits a portion of the dissolved matter on cooling. Some substances are so soluble in water, that they extract its vapour from the atmosphere, and dissolve themselves in it. Moreover, when water is heated in a strong closed vessel to a temperature above that of the ordinary boiling-point, 212°, its solvent powers are much increased. Pieces of plate and crown glass, acted upon for four months by water at 300° (in a steam-boiler), were found by the late Professor Turner to be reduced to a white mass of silica, destitute of alkali; while stalactites of siliceous matter, more than an inch in length, hung from the little wire cage which enclosed the glass—an experiment illustrating the action which goes on in the Geyser springs of Iceland, which deposit siliceous sinter. All gases are soluble in water, but water dissolves very unequal quantities of different gases, and very unequal quantities of the same gas at different temperatures. Some gases are so extremely soluble in this fluid, that it is necessary to collect them over mercury. For example, at 32°, 1 volume of water dissolves somewhat less than $\frac{1}{10}$ th of its volume of hydrogen, and exactly $\frac{1}{10}$ th of its volume of nitrogen, while it dissolves 506 and 1050 volumes of hydrochloric acid and ammonia gases: and while at 32° water dissolves 1.8 times its volume of carbonic acid, it dissolves only half that volume of the gas at 60°.

Water enters into combination with acids, bases, and salts. When an acid has once been allowed to combine with water, the latter can seldom be entirely removed unless by the intervention of a powerful base, which displaces the water, and allows of its removal by heat. For example, if sulphuric acid be largely diluted with water, and exposed to heat, watery vapour alone at first passes off; but as the temperature is raised to about 600°, a point is reached at which acid and water distil over together. The liquid at this stage of concentration is found to be composed of one equivalent of acid and one of water (HO.SO₃). The further separation of the water can only be effected by the addition of a base, as potash, oxide of lead, &c. Water which, as in this case, supplies the place of a

* During the last few years Gerhardt's views as to the necessity of doubling the atomic weights of oxygen, carbon, sulphur, and a few other of the elements have been gradually gaining ground. Thus, the combining numbers of oxygen, carbon, and sulphur, instead of being 8, 6, and 16, are now fixed at 16, 12, and 32, and the corresponding symbols are indicated by a horizontal bar, which doubles the value of the symbol; \bar{O} , \bar{C} , and \bar{S} being written in place of O, C, and S. According to these views, the symbol for an equivalent of water is H₂ \bar{O} , or H₂O₂, in place of HO, and the combining number is 18 in place of 9 (see CHEMISTRY, in Supplement).

† Although water is colourless in small bulk, it is blue like the atmosphere when viewed in mass. This is seen in the deep ultramarine tint of the lakes of Switzerland and other Alpine countries, and in the rivers issuing from them; and in the water in the fissures and caverns found in the ice of the glaciers, which, except on the surface, is extremely pure and transparent; and the deep blue tint of the ocean is doubtless due to the water itself, rather than to the salts dissolved in it.

base, is called *basic water*, and the compound is called a *hydrate*, or is said to be *hydrated*. Similarly, water combines with strong bases, such as potash and soda, and heat can only succeed in reducing a mixture of potash and water to a condition represented by one equivalent of each (HO, KO); and this last equivalent of water can only be removed by the addition of an acid. In this case, the water in combination with the base acts the part of an *acid*. These compounds also are *hydrates*. In these cases of acids and bases, the one equivalent of water cannot be removed without completely altering the chemical character of the body. (See, for instance, in the article *SULPHURIC ACID*, the difference between the properties of hydrated sulphuric acid and sulphuric anhydride.) In the case of many salts, however, a certain quantity of the water entering, so to speak, loosely into their composition may be expelled by heat without altering the properties of the salt. The water capable of being thus got rid of is called *water of crystallisation*, and is taken up by the salt in the act of crystallising. The form of the salt depends upon this water of crystallisation. In chemical formulæ, this variety of water is represented by Aq instead of by HO . For example, in the formula for rhombic phosphate of soda— $2\text{NaO}, \text{HO}, \text{PO}_5 + 24\text{Aq}$ —the HO represents an equivalent of basic water, while 24Aq represents 24 equivalents of water of crystallisation.

It is less than a century since the ancient view, that water was one of the four elements, has ceased to be believed in. It is now known that it is a compound of oxygen with hydrogen in the proportion of one equivalent of each. Hence its symbol is HO , and its combining number 9. When converted into vapour, 9 grains of steam occupy the bulk of 8 grains of oxygen at the same temperature; hence the combining volume of aqueous vapour is equal to 2, if the combining volume of oxygen be taken as 1. That water is such a compound as has been just stated may be proved either analytically or synthetically; and the subject is one of so great importance in the history of chemistry, that we shall enter rather more fully than usual into the consideration of these two modes of proof. The following simple mode of separating water by voltaic electricity into its constituent elements is borrowed from Fownes's *Manual of Chemistry*: 'When water is acidulated so as to render it a conductor, and a portion interposed between a pair of platinum-plates connected with the extremities of a voltaic apparatus of moderate power, decomposition of the liquid takes place in a very interesting manner; oxygen in a state of perfect purity is evolved from the water in contact with the plate belonging to the copper end of the battery, and hydrogen, equally pure, is disengaged

at the plate connected with the zinc extremity, the middle portions of the liquid remaining apparently unaltered. By placing small graduated jars over the platinum-plates, the gases can be collected, and their quantities determined. The accompanying figure will shew at a glance the whole arrangement; the conducting-wires pass through the bottom of the glass cup and away to the battery. When this experiment has been continued a sufficient time, it will be found that the volume of the hydrogen is a very little above twice that of the oxygen; were it not for the circumstance of oxygen being sensibly more

soluble in water than hydrogen, the proportion of two to one by measure would come out exactly.' In lecture-rooms, an ingenious but more complicated apparatus, devised by Kopp, is commonly used to illustrate the electrolysis of water. It has been shewn by Mr Grove that an extreme heat may, like electricity, be employed to decompose water into its constituents; and it is well known that if, in the form of steam, it be passed over red-hot iron, it parts with its oxygen to the metal, while the hydrogen is given off as gas. The synthetical proof of the composition of water is afforded by passing pure hydrogen and oxygen, in the ratio of two volumes of the former to one volume of the latter, into a strong glass tube filled with mercury, and exploding the mixture by an electric spark, when the gases are replaced by a corresponding quantity of moisture, and the mercury is forced into the tube so as to fill it. The most satisfactory form of this synthetical proof is, however, afforded by reducing pure oxide of copper at a red heat by hydrogen, and collecting and weighing the water that is thus formed. The apparatus required for this experiment, and the method of employing it, are given in Fownes's *Manual of Chemistry*, 9th ed., p. 131, and in Miller's *Inorganic Chemistry*, 3d ed., p. 52.

Owing to its extremely solvent powers, the *pure water* which we have been hitherto considering is never found in nature. The nearest approach to a natural pure water is *rain-water*, after a continuance of wet weather; but even this water always contains in 100 volumes about 2.5 volumes of atmospheric air, with a trace of ammonia; and in point of fact, it seems impossible to obtain water which does not contain this ingredient, for, after two distillations, Professor Miller found from 1.85 to 2.38 volumes of air in 100 volumes of water. In addition to rain-water, the other *natural waters* may be included under the heads of *Spring-water*, *Mineral Waters* (already considered in a special article), *River-water* (see *WATER-SUPPLY*), and *Sea-water* (see below).

This article would be incomplete without a brief notice of the prolonged and acrimonious controversy that was for many years carried on, and is probably now hardly to be regarded as settled, regarding the respective claims of different philosophers to be the true discoverer of the nature and composition of water. In the year 1781, Cavendish made a long and careful series of experiments, which, unfortunately, were not published till January 1784, when his celebrated Memoir entitled *Experiments on Air*, was read to the Royal Society. In the interval (June 1783), his friend, Dr Blagden, visited Paris, and on the authority of Cavendish, gave an account of the experiments proving the composition of water to Lavoisier; and this delay between the discovery and the date of publication caused his claims to one of the most marvellous discoveries the world ever saw, to be contested by an English and a French rival, James Watt and Lavoisier. It may be briefly stated, that Cavendish's experiments consisted in exploding, in various proportions, mixtures of hydrogen and atmospheric air, and of hydrogen and oxygen, and finding as the result a liquid which proved to be pure water. (Priestley and his friend, Mr Warltire, had made similar experiments, and had noticed the deposition of moisture that followed the explosion, but failed to recognise in it anything but the condensation of aqueous vapours in the gases.) The general conclusion to which Cavendish came was, in his own words, 'that water consists of dephlogisticated air united with phlogiston,' and as dephlogisticated air was his term for oxygen, and phlogiston his term for hydrogen, this statement corresponds to the modern view of the

nature of water introduced by Lavoisier. As Lavoisier was from the first accused by the English chemists of having acted unfairly towards them, and as indeed his own claim only dates back to June 25, 1783, he may be dismissed from further consideration; and during the lives of the English claimants there were no public complaints on either side, although Watt, in private letters to his friends, hinted at Cavendish's incapacity and unfairness. Hence, then—at all events, in this country—scientific men were startled when Arago, then Secretary of the French Academy, published in 1838 the *Eloge* of Watt, which he had read as far back as December 1834, in which he charged Cavendish with deceit and plagiarism, inasmuch as he was said to have learned the composition of water, not by experiments of his own, but by obtaining sight of a letter from Watt to Priestley. The battle now fairly began; the first blow being struck in August 1839, when the President of the British Association, the Rev. Vernon Harcourt, in his opening address, vindicated Cavendish, and pointed out Arago's misstatement. At a subsequent meeting of the Academy, Arago, with Dumas to back him, defended his statements. Sir David Brewster (*Edin. Rev.*, January 1840) then sought to act as mediator; and the controversy, as might have been expected, went on with increased acrimony; and in the summer of the same year, when the President of the British Association published the Report he had delivered the preceding year, he added a postscript, replying to Arago, Dumas, and Lord Brougham (who had appended 'An Historical Note on the Discovery of the Theory of Water,' to Arago's *Eloge*). In 1841, Berzelius published what Dr George Wilson terms 'a conditional judgment' in favour of Watt; and in 1845, in his *Lives of Men of Letters* (see *Life of Watt*, p. 400), Lord Brougham followed on the same side. Dr Peacock (*Quart. Rev.*, 1845, p. 105), in reviewing his book, assailed his conclusions, and asserted the claims of Cavendish. In 1846, Mr Harcourt (*Lond. and Edin. Phil. Mag.*, Feb. 1846) also replied to Lord Brougham; and in 1847, in the second edition of his *History of the Inductive Sciences*, Dr Whewell maintained his old conviction of the claims of Cavendish. In 1846, the publication of the *Correspondence of the late James Watt on his Discovery of the Theory of the Composition of Water*, with an introduction by his kinsman, Mr Muirhead, who was editor, and a letter from his son, formed a most important addition to the literature of this controversy. Finally, the question was discussed, in 1847, by Sir David Brewster in the *North British Review*, and in 1848, by Lord Jeffrey in the *Edinburgh Review*, both of whom advocated the claims of Watt. As we have no space to discuss Watt's real claims, we may here state that Dr George Wilson, whose *Life of Cavendish* is in reality a strictly impartial history of the water-controversy, maintains on very sound grounds that in reality Watt was informed of Cavendish's discovery through Priestley, as Lavoisier was through Blagden.

SEA-WATER.—For an accurate knowledge of the composition of sea-water, we are mainly indebted to the investigations of Professor Forchhammer of Copenhagen. Not very many years ago, the only elements known to exist in sea-water, in addition to those constituting water itself, were chlorine, iodine, bromine, sulphur, carbon, sodium, magnesium, potassium, calcium, and iron. To these twelve must now be added, (13) fluorine, discovered by Dr George Wilson; (14) phosphorus, as phosphate of lime; (15) nitrogen, as ammonia; (16) silicon, as silica, in which form it is largely collected by sponges from sea-water; (17) boron, as boracic acid; (18) silver; (19)

copper; (20) lead; (21) zinc; (22) cobalt; (23) nickel; (24) manganese; (25) aluminium, as alumina; (26) strontium, as strontia; (27) barium, as baryta. Several of these elements, however, exist in such small quantities that they can only be discovered indirectly, that is to say, in sea-weeds, marine animals, or in the stony matter deposited at the bottom of the boilers of oceanic steamers. The substances which, in respect of quantity, play the principal part in the composition of sea-water are chlorine, sulphuric acid, soda, potash, lime, and magnesia; those which occur in less but still determinable quantity, are silica, phosphoric acid, carbonic acid, and oxide of iron. In the elaborate tables which are annexed to his paper, Forchhammer has always calculated the single substances (chlorine, sulphuric acid, magnesia, lime, and potash) and the whole quantity of salt for 1000 parts of sea-water; but besides this, he has calculated the proportion between the different substances determined, referred to chlorine = 100, and of all the salts likewise referred to chlorine. This last number is found if we divide the sum of all the salts found in 1000 parts of any sea-water by the quantity of chlorine found in it; and he terms it the *co-efficient* of that sample of sea-water.* This chemist divides the sea into seventeen regions, his reasons for doing so being that he could thus avoid the prevailing influence which those parts of the ocean which are best known, and from which he has taken most observations, would exert upon the calculations of the mean number for the whole ocean. In reference to the *salinity* of the surface of the ocean, he has made the following observations. (1.) The mean salinity of the Atlantic between 0° and 30° N. lat. is 36.169 (i.e., this is the quantity of salts in 1000 parts of water); the maximum, which is also the maximum of the surface-water of the whole Atlantic, being 37.906, and occurring in 24° 13' N. lat., and about 5° W. from the coast of Africa, where no rivers of any size carry water from the land, and where the influence of the dry and hot winds of the Sahara is prevailing. This maximum is equal to the mean salinity of the Mediterranean, and is only exceeded by the maximum of that sea off the Libyan Desert, and that of the Red Sea. The minimum is 34.283 in 4° 10' S. lat., and 5° 36' W. long., close to the coast of Africa, where the large masses of fresh water which the great rivers of that region pour into the ocean exercise their influence. (2.) In the Atlantic, between 30° N. lat. and a line drawn from the north point of Scotland to the north point of Newfoundland, the mean salinity is 35.946, the diminution being due to the fresh water poured into it by the southern mouth of the St Lawrence. (3.) In the Baffin's Bay and Davis' Strait region, the mean salinity is 33.281, and the salinity increases from latitude 64° towards the north, being in 64°, 32.926, and in 69°, 33.598. This peculiarity is owing (says Forchhammer) to the powerful current from the Parry Islands, which through different sounds passes into Baffin's Bay, where it is mixed with the great quantity of fresh water that comes into the sea from the West Greenland glaciers. Had this fact been known before the sounds that connect the Parry Archipelago with Baffin's Bay were discovered, it might have proved the existence of these sounds, because bays and inlets shew quite the reverse: the further we get into them, the less saline the water becomes. (4.) From eleven observations on the Mediterranean between the Straits of Gibraltar and the Greek Archipelago, he confirms the old view of

* We give these details because the term *co-efficient* will now doubtless be permanently retained by writers on the chemistry of sea-water.

WATER.

its great salinity; its mean salinity being 37·936, while that of the whole ocean is 34·388. Its maximum (39·257) falls between the inland of Candia and the African shore; and its minimum (36·301) is at the Straits of Gibraltar. These results are due to the influence of Africa and its hot and dry winds. In salinity, the Mediterranean is only exceeded by the Red Sea, whose mean salinity is 43·067. (5.) The Black Sea, like the Baltic, is a mixture of salt and fresh waters. In three different experiments, the salinity varied from 18·146 to 11·360. At a distance of 50 miles from the Bosphorus, the proportions between chlorine, sulphuric acid, lime, and magnesia, were 100 : 11·71 : 4·22 : 12·64, while the normal oceanic proportions are 100 : 11·89 : 2·96 : 11·07; thus shewing a relative increase in the lime and magnesia. (6.) As the Caspian Sea is considered by many geologists to have been formerly in connection with the Black Sea, the results of Mahner's analysis of its waters are given. The salinity varied between 56·814 and 6·236, and the proportion between the chlorine, sulphuric acid, lime, and magnesia, is 100 : 44·91 : 9·34 : 21·48, which differs extremely from the normal proportion. Thus the Caspian Sea, if it ever had any connection with the Black Sea, must have entirely changed its character since that time—a change which might be occasioned by the different salts which the rivers brought into it, and which accumulated there by evaporation of the water; or which might be caused by the deposition of different salts in the basin of the Caspian Sea itself. (7.) The Atlantic between 30° S. lat. and a line from Cape Horn to the Cape of Good Hope, is less saline than the corresponding region north of the equator;

and all the samples from the western part of this region have less, while the samples from the eastern part, nearer to the African coast, have considerably more sulphuric acid than the normal quantity. Does this, asks Forchhammer, depend upon the more volcanic nature of the west coast of Africa than the east American coast? (8.) In the sea between Africa and the East India Islands, the mean salinity is 33·868. The minimum (25·879) is from a place high up in the Bay of Bengal, and of course much influenced by the Ganges. It lies, however, about 300 miles from the mouth of that river; and another specimen taken 60 miles nearer the mouth has a salinity of 32·365, so that it would seem as if some other cause (possibly fresh-water springs at the bottom) had been in operation to weaken the sea-water at the minimum spot. (9.) In the Patagonian cold-water current, the mean salinity was 33·966; while three samples brought from the South Polar Sea, by the late Sir James Ross, had different salinities of 28·565, 15·598, and 37·513. Forchhammer cannot account for these discrepancies. All the specimens shewed a great excess of sulphuric acid (12·47 in place of 11·88, as compared with 100 of chlorine), a result probably due to the volcanic nature of the antarctic continent. Forchhammer's analyses of waters from other of his 17 districts call for no remark; and the following are the general results of his investigations. 'If we except the North Sea, the Kattegat, Sound, and Baltic, the Mediterranean and Black Sea, the Caribbean Sea and the Red Sea, which have all the characters of bays of the great ocean, the mean numbers are the following :

| Sea-water. | Chlorine. | Sulphuric Acid. | Lime. | Magnesia. | All Salts. | Coefficient. |
|--------------|-----------|-----------------|-------|-----------|------------|--------------|
| 1000 | 18·999 | 2·258 | 0·556 | 2·096 | 34·404 | 1·612 |
| Equivalents, | 100 | 11·88 | 2·93 | 11·08 | | |
| | 479 | 45 | 16 | 82 | | |

Thus it is evident that the sea-water, in its totality, is as little a chemical compound as the atmospheric air; that it is composed of solutions of different chemical compounds; that it is neutral, because it everywhere in the atmosphere finds carbonic acid to neutralise its bases, and everywhere on its bottom and shores finds carbonate of lime to neutralise any prevailing strong acid; that lastly, the great stability of its composition depends upon its enormous mass, and its constant motion, which occasions that any local variation is evanescent compared to the whole quantity of salt. It will be seen that the Atlantic is that part of the ocean which contains the greatest proportion of salt, while some of the bays in the tropical or subtropical zone (the Mediterranean and Red Sea, for example) have a greater mean than the Atlantic; that on approaching the shores, the sea-water, as might have been expected, becomes more diluted, and consequently less saline; that the polar currents contain less salt than the equatorial; that the polar current of West Greenland contains more sulphuric acid than the water in any other region except the East Greenland and south polar currents (while in the ocean at large, the chlorine is to the sulphuric acid as 100 : 11·89; in the south polar current it is as 100 : 12·55). As in the case of the West Greenland current, there is no neighbouring volcanic region to account for this excess, Forchhammer suggests that the absence of fucoidal plants, which have a great attraction for sulphuric acid, may have an influence in bringing about this result.* that

most lime occurs in the ocean in the second region, the middle part of the Northern Atlantic; and the least in the West Greenland polar current (the quantities being 3·07 and 2·77 respectively). Wherever, in other regions, the influence of land prevails, the lime also is in excess; thus, in the Black Sea, it was 4·221.

From these remarks on the surface-water, we pass on briefly to notice the difference of sea-water in different depths. On this subject, the result obtained from the analyses of specimens of sea-water taken from different regions, is so contradictory, that we shall simply quote the sentence with which Forchhammer commences this department of his subject: 'It would be natural to suppose that the quantity of salts in sea-water would increase with the depth, as it seems quite reasonable that the specific gravity of sea-water would cause such an arrangement. But this difference in specific gravity, relative to the increase in the quantity of salts, is counteracted by the decreasing temperature from the surface to the bottom. We have parts of the sea where the quantity of solid salts increases with the depth; in other parts, it decreases with the increasing depth; in other places, hardly any differences can be found between surface and depth; and lastly, I have found one instance where water of a certain depth contained more salt than both above and below.

sulphides and to sulphuretted hydrogen, which, with the oxide of the iron of the plant, which is partly dissolved and partly suspended, will form sulphide of iron. Thus, the sulphur will disappear from the water. He suggests that the diminution of sulphuric acid which he found in the Atlantic, between the equator and 30° N. lat. (11·75 in place of 11·89), may be due to the action of the Sargasso Sea.

* In a paper read before the British Association in 1844, Forchhammer shewed that the focus tribe has a great attraction for sulphuric acid, and that the acid, when the plant undergoes putrefaction, is reduced to soluble

These differences are, to a great extent, dependent upon currents both on the surface and in different depths.—*Op. cit.*, p. 229. Sometimes, salinity of the surface-water is the same as that of the deep: or one or more ingredients may vary in its proportions: for example, in the Mediterranean, while the deep water, generally, is richer than the surface-water in sulphuric acid, in some parts, as between Sardinia and Naples, the surface-water is the richer in that ingredient. There are few observations on the specific gravity of the sea-water at different depths. For the following observations, we are indebted to Sir James Ross. 'At 39° 16' S. lat., 177° 2' W. long., the specific gravity of the surface-water was 1.0274; at 150 fathoms, 1.0272; and at 450 fathoms, 1.0268: all tried at the temperature of 60° F., and shewing that the water beneath was specifically lighter than that of the surface, when brought to the same temperature: our almost daily experience confirmed these results.'—*Voyage*, &c. vol. ii. p. 133.

The important questions—How did the salts which now occur in the sea come into it? Is it the land that forms the sea, or is it the sea that makes the land? Are the salts that are now found in sea-water washed out of the land by the atmospheric water? Has the sea existed from the beginning of the earth? And has it slowly but continually given its elements to form the land? and their answers, constitute the last part of Forchhammer's most philosophical and laborious Memoir. The following is, in a condensed form, his reply to these questions. Suppose a river had its outlet in a valley, with no communication with the sea; the valley would be filled with water till its surface was so great that the annual evaporation was equal to the annual supply. There would then be a physical, but not a chemical equilibrium, because the annual loss would consist of pure water, while the received water would contain various mineral or saline matters, which would go on increasing till chemical changes would occasion precipitation of different salts. Now, in the water of the assumed river, we should find the bases prevailing in the following order—lime, magnesia, soda, iron, manganese, and potash; while the acids, similarly arranged, were carbonic, sulphuric, muriatic (chlorine), and silicic. Now, all these substances are found in sea-water, although in very different proportions. The ocean is, in point of fact, such a lake as we have here supposed, with all the rivers carrying their dissolved matters into it. 'Why, then,' our author asks, 'do we not observe a greater influence of the rivers? Why does not lime, the prevailing base of river-water, occur in a greater proportion in the water of the ocean? In all river-water, the number of equivalents of sulphuric acid is much smaller than that of lime, and yet we find in sea-water about three equivalents of sulphuric acid to one of lime. There must thus be in sea-water a constantly acting cause that deprives it again of the lime which the rivers furnish, and we find it in the shell-fishes, the corals, the bryozoa, and all the other animals which deposit carbonate of lime.' These animals not only deprive the water of its carbonate of lime, but they likewise decompose the sulphate of lime—a decomposition probably depending upon the carbonate of ammonia formed by the vital processes of these animals. The silica, which is always present in river-water, is appropriated by the varied sponges, diatoms, &c., and hence its scantiness in sea-water. With regard to the sulphuric acid conveyed into the sea, a small part enters into the composition of shells, corals, &c., and a greater part is attracted by sea-weeds, in which it undergoes reduction, as already described, while the balance remains in the sea-water. The

magnesia of the river-water enters in small quantity into marine shells and corals, but only a small quantity is thus abstracted from sea-water, while the soda and muriatic acid, or chlorine, form, as far as we know, by the pure chemical, or organo-chemical action that takes place in the sea, no insoluble compound. 'Thus,' he concludes, 'the quantity of the different elements in sea-water is not proportional to the quantity of elements which river-water pours into the sea, but inversely to the facility with which the elements in sea-water are made insoluble by general chemical or organo-chemical actions in the sea; and we may infer that the chemical composition of the water of the ocean in a great part is owing to the influence general and organo-chemical decomposition has upon it, whatever may have been the composition of the primitive ocean.'

WATER-BED, called also the HYDROSTATIC BED, or FLOATING MATTRESS. It is well known that the life and health of every part of the animal body depend on the sufficient circulation through them of refreshed blood. See CIRCULATION. Now, when a person in health is sitting or lying, the parts of the flesh compressed by the weight of the body do not receive the blood so copiously as at other times; and if from any cause the action of the heart has become weak, the interruption will follow both more quickly and be more complete. A peculiar uneasiness soon arises where the circulation is thus obstructed, impelling to change of position; and the change is made as regularly and with as little reflection as the winking of the eyes to wipe and moisten the eyeballs. A person weakened by disease, however, while generally feeling the uneasiness sooner, as explained above, and becoming restless, makes the changes with increasing fatigue; and should the sensations become indistinct, as in the delirium of fever, in palsy, &c., or should the patient have become too weak to obey the sensation, the compressed parts are kept so long without their natural supply of blood, that they lose their vitality, and become what are called sloughs or mortified parts. These, if the patient survives, have afterwards to be thrown off by the process of ulceration, leaving deep hollows to be filled up by new flesh during a tedious convalescence. Many a fever or other disease, after a favourable crisis, has terminated fatally from this occurrence of sloughing on the back or sacrum. The same termination is common in lingering consumptions, palsies, spine diseases, &c., and generally in diseases that confine the patient long to bed.

It was to mitigate all, and entirely to prevent most of the evils attendant on the necessity of remaining long in a recumbent posture, that the hydrostatic bed was devised by Dr Neil Arnott, one of the Queen's physicians. The bed may be shortly described as a mattress floating on water, with a loose sheet of caoutchouc cloth properly secured between it and the water, to prevent its being wetted. A person rests on it as a waterfowl does on its bulky feathers, with as little inequality of local pressure as if in a bath. A trough of the dimensions of a wide sofa or bed, having six or seven inches depth of water in it, with the required caoutchouc covering, is the foundation, on which clothes and pillows are laid as in a common bed. A full description is given in Dr Arnott's book, the *Elements of Physics* (6th edition, Longman & Co.). The bed not only prevents the occurrence of bed-sores, but by lessening antecedent distress, lessens also the danger of the illness.

On a sudden emergency, or when the need of the fluid support is not very urgent, local relief may be given by forming in any way a partial hollow or

WATERBRASH—WATER-DROPWORT.

depression in a bed, and placing in it a water-sack or bag half-filled, so as to remain loose or slack. This approaches in effect the slack-sided cushion, which is another modification of the invention.

WATERBRASH. See PYROSIS.

Water-budgets.

WATER-BUDGET, a heraldic bearing in the form of a yoke with two pouches of leather appended to it, originally intended to represent the bags used by the Crusaders to convey water across the desert, which were slung on a pole, and carried across the shoulders. The Trusbuts, Barons of Wartre in Holderness, bore *Trois boutz d'eau*, three water-budgets, symbolising at once their family name and baronial estate; and by the marriage of the heiress, similar arms came to be assumed by the family of De Ros, who bear gules, three water-budgets argent.

WATER-BUG, the popular name of a tribe or section of Heteropterous insects, *Hydrocoriæ*, which live almost entirely in water, and feed upon other aquatic insects. The anterior portion of the first pair of wings is horny; the antennæ are very small, and concealed beneath the eyes. The *Hydrocoriæ* are divided into two families, *Notonectidæ*, and *Nepidæ*. Of the former, the Boat-fly (q. v.) is an example. The *Nepidæ* are popularly known as

Water Scorpion.

SCORPIONS, from the form of their fore-legs, which are efficient instruments for seizing their prey. Some of the *Nepidæ* are powerful insects, two or three inches long.

WATERBURY, a township and city of New Haven county, Connecticut, U. S., 33 miles southwest of Hartford, on the left bank of the Naugatuck River, at its confluence with Great Brook and Mad River, whose falls furnish abundant water-power. It is a well-built town, with a fine park and ornamental cemetery, 7 churches, 2 banks, and 30 large manufactories of rolled copper, brass, German-silver, plated ware, pins, hooks and eyes, buttons, lamps, clocks, percussion-caps, &c. It has been built up by small mechanics, and is the head-quarters of the brass business in the United States. Pop. in 1860, 10,004.

WATER CALTROP. See TRAPA.

WATER CHESTNUT (*Marron d'Eau*), the name given in France to the edible seeds of the *Trapa natans* (see TRAPA).—The name Water Chestnut is also given to the edible tubers of the *Scirpus tuberosus*, a plant of the natural order *Cyperaceæ* (see BULRUSH and CYPERACEÆ), which is cultivated by the Chinese in tanks very abundantly supplied with manure. It is destitute of leaves, except a slender short sheath or two at the base of each culm. It is stoloniferous, and the tubers are produced on the stolons. They are in high estimation among the Chinese, both for food and as a medicine, and are eaten either raw or boiled. They are called *Pi-tsi* or *Maa-tai*.

WATER-COLOURS are painters' colours mixed with water and some adhesive material, as gum or size instead of oil. Those intended for drawings on paper are prepared with great care, and are usually formed into dry cakes with gum. Those for colouring walls and scene-painting are roughly prepared

with glue or size. These are often called Distemper Colours, from the Italian term *tempera*, applied to them to express their application to temporary purposes.

WATER-CRESS. See CRESS.

WATER-DOG, a kind of dog, of which the Poodle (q. v.) is regarded as a sub-variety. The head is rather large and round, the ears long, the legs rather short, the general form compact, the hair everywhere long and curly. The Water-dog of England, common before the poodle had been introduced from the continent, is still much esteemed

Water Spaniel.

by professional wild-fowl shooters, and by the fishermen of the north-eastern counties. It is about 18 or 20 inches high at the shoulder. The hair is coarser and crisper than that of the poodle. This dog was formerly sometimes used in London for the brutal sport of hunting and worrying domestic ducks, placed in a pond for the purpose. It is an intelligent and affectionate kind of dog, although not of much beauty.

WATER-DROPWORT (*Enanthe*), a genus of plants of the natural order *Umbelliferæ*; having ovato-cylindrical fruit, not prickly nor beaked, each carpel

Water-dropwort (*Enanthe crocata*).

with five blunt convex ribs, and single vittæ in the interstices; the calyx teeth lanceolate; the petals obcordate and radiant, with an inflected point; the

with five blunt convex ribs, and single vittæ in the interstices; the calyx teeth lanceolate; the petals obcordate and radiant, with an inflected point; the

partial involucre of many rays; the flowers of the circumference on long stalks and sterile, those of the centre subsessile and fertile. A number of species are natives of Britain, large perennial plants, with a strong and generally disagreeable aromatic smell, and (compound or decomposed leaves. The COMMON W. (*Æ. fistulosa*) and the HEMLOCK W., or WATER HEMLOCK (*Æ. crocata*), are both common in wet places in Britain and throughout Europe, and both are narcotic acrid poisons. The roots of the latter have some resemblance to small parsnips, and hence fatal accidents have frequently occurred.—The FINE-LEAVED W., called Water Fennel by the Germans (*Æ. phellandrium*, formerly known as *Phellandrium aquaticum*), is also common in ditches and ponds both in Britain and on the continent. It has a jointed root-stalk (*rhizome*), with tufted whorled fibres, and a strong zigzag stem dilated at the base. The leaves are decomposed. The fruit has a peculiar aromatic but disagreeable smell. It is not so poisonous as the other species just named. It was at one time erroneously regarded as a specific against pulmonary consumption; but it has been advantageously employed in pulmonary complaints.

WATEREE, a river of the U. S., formed by the junction of the Catawba and Fishing Creek in North Carolina, runs south-east into South Carolina, where it unites with the Congaru to form the Santee. Steamboats ascend the W. to Camden, 200 miles from the sea.

WATERFALL is a break in the continuity of slope of the channel of a river or stream, so abrupt that the body of water falls from the higher to the lower level. Waterfalls occur most frequently in mountainous countries, where the streams from the mountain sides enter the valleys. It is only when the side of the valley is composed of hard rock that there can be a waterfall; in friable strata the stream wears out a ravine or side-valley. These mountain waterfalls, however, are generally rather curious and picturesque than grand, the volume of water being in most cases comparatively insignificant, though the height of fall is occasionally very great. All mountain waterfalls necessarily change their aspect from season to season—in winter, a roaring torrent plunging headlong into the abyss; in summer, often a mere film of water trickling down the face of the precipice. Waterfalls in comparatively level districts are not nearly so common, and their height of fall is insignificant compared with that of mountain cataracts; but the much greater volume of water, its steady and even flow to the head of the precipice over which, in solid column, it descends with a thundering plunge, place such waterfalls among the grandest of nature's phenomena. It is where the course of a large river passes from a higher to a lower plateau, and where the upper plateau is edged with rock, that the grander cataracts are formed. If the rocks are of the same hardness from top to bottom, the edge of the escarpment, supposing it to be perpendicular at first, becomes worn off, and a slope or rapid is formed. But when the upper edge is hard and the under strata soft and friable, the reverberation of the spray wears away the softer parts below, leaving a projecting ledge at the top, which breaks off, piece by piece, as it becomes too much undermined, so that the fall is constantly receding. The question of the rate of regression of waterfalls has not hitherto occupied much attention, and has only been estimated in the case of Niagara, Bakewell giving its annual value at 1 yard, while Lyell limits it to about a third of this. Some of the most remarkable waterfalls of the world are the Oro Falls at Monte Rosa, 2400 feet in height; Gavarnie

(Pyrenees), 1400 feet; Staubbach (Switzerland), 1000 feet; Maanelvaan (Norway), 940 feet; Niagara (q. v.); Zambezi (q. v.); Missouri; and that in Mariposa County, California, said (on hitherto unsatisfactory authority) to be the highest in the world. The cataracts of the Velino and Anio, in Italy, are beautiful artificial imitations of this most striking of natural phenomena.

WATER FLEA (*Daphnia*), a genus of *Entomostraca*, of the order *Cladocera*, and family *Daphniadae*. One species, *D. monoculus*, is abundant in pools and ditches in Britain. It comes to the surface in the mornings and evenings, but keeps near the bottom during the heat of the day. It swims by taking short springs, whence its popular name. It feeds on minute particles both of animal and vegetable substances. It is a beautiful object for the microscope; the whole interior organisation being visible through the transparent carapace. The male is much smaller than the female, and comparatively rare. The eggs, after leaving the ovary, are retained in a cavity between the body and the carapace, until the young have attained almost their perfect form.

WATERFORD, a maritime county of the province of Munster, Ireland, is bounded on the N. by the counties of Tipperary and Kilkenny, on the E. by Wexford, on the S. by the Atlantic, and on the W. by the county of Cork. Its greatest length from east to west is 52 miles, and its breadth, north to south, 28; the total area being 721 sq. m., or 461,563 acres, of which 325,345 are arable, 105,496 waste, 23,468 in plantations, 526 in towns, and 5779 under water. The pop. in 1851 was 164,051, and in 1861, 134,252; of whom 107,225 were Catholics, 3208 Protestants of the established church, and the rest Protestants of other denominations. The number of acres under crops of all kinds in 1862 was 112,279, of which 13,520 were under wheat, 32,900 under oats, 18,787 under potatoes, 11,053 under turnips, and 19,775 in meadow and clover. The coast-line extends from the estuary of the Suir, Waterford Harbour, to that of the Blackwater at Youghal, and is partly flat, partly rocky, but in general very dangerous for shipping. The rocky district contains some remarkable caverns. The surface of W. is in general mountainous. The principal ranges are Knockmeledown, the Cumberagh, Monevolagh, and Drum. The Cumberagh Mountains are the loftiest, and abound in wild and picturesque scenery. The Suir (q. v.) and the Blackwater (q. v.) are the chief rivers. There are no lakes worthy of note. The climate is moist, and over a considerable part of the county the soil is marahy; but the upland districts are well suited for tillage, and the lower pasture-lands, although inferior in fattening properties to those of the great central plain, produce excellent butter, which is exported in large quantities. In geological structure, the mountains present the old and new slate, separated by red and gray quartz rock and quartzose slate. Of quarry slate, there are two principal varieties, which are raised extensively for local use. The valleys belong to the limestone series, being an outlying prolongation of the great bed of the central plain. Lead, iron, and copper are found, and have all been raised with more or less success. The two former, however, have proved unprofitable, but the copper-works at Bonmahon and Knockmahon have for many years been among the most productive of the Irish mines. Marble of several colours and of considerable beauty is quarried near Cappoquin and Whitechurch, and potter's clay of good quality is found at Kildrum, near Dungarvan. The chief occupations of the

population are pasturage and dairy-farming; but a considerable manufacture both of cotton and linen has been recently introduced at Portlaw, and the shipping-trade has of late years become active and profitable.

W. is divided into eight baronies. The most considerable towns besides Waterford City (q. v.) are Dungarvan, Carrick-beg—properly a suburb of Carrick-on-Suir, which is in Tipperary—Lismore, Cappoquin, Tallow, and Tramore. Clonmel, although chiefly in Tipperary, lies partly within this county. W. returns five members to parliament—two for the county, two for Waterford City, and one for the borough of Dungarvan. The county constituency in 1863 was 3664. The net annual value of property in W., under the Tenement Valuation Act, is £263,047. This district, in common with the adjoining county of Wexford, is believed to have been anciently peopled by a Belgic colony. The Danes also formed a settlement at the mouth of the Suir. From the date of the invasion, W. became a stronghold of the English, large grants having been made by Henry II. to the family of Le Poer; and in all the alternations of the subsequent struggle with the Irish population, it continued for the most part a firm centre of English influence. The county abounds with antiquities ecclesiastical and military, and of the Celtic and Danish, as well as the Anglo-Norman period.

WATERFORD, a city, capital of the county of the same name, but itself a county of a city, and a parliamentary borough, is situated in N. lat. 52° 16', W. long. 7° 8', on the river Suir, 12 miles from the sea, and 97 south-south-west from Dublin, with which city it is connected by the Great Southern and Western, and Waterford and Limerick Junction Railways, as also by the Waterford and Kilkenny Railway. The pop. in 1861 was 23,293, of whom 20,429 were Roman Catholics, 1969 Protestants of the established church, and the rest Protestants of other denominations. The city, with the exception of an inconsiderable suburb, with which it is connected by a bridge of 39 arches, 852 feet long, opening for the passage of ships, lies on the right bank of the Suir, along which a handsome and spacious quay extends for a distance of nearly a mile, and from which the city ascends gradually in well-built streets. Vessels of 2000 tons are now enabled to discharge their cargoes at the quay; but there is an anchorage for still larger ships about six miles lower down the river, at Passage. The public buildings of most considerable pretensions are the Protestant cathedral and that of the Roman Catholic bishop, the Protestant episcopal palace, the (Catholic) college of St John, the Model National School, and the city and county court-houses. In addition to the Union Workhouse, there is an infirmary, a dispensary, a fever hospital, a district lunatic asylum, and a penitentiary. The affairs of the municipality are administered by a mayor and corporation consisting of ten aldermen and thirty councillors; those of the port, by a body of commissioners, 24 in number, elected by the corporation and the Chamber of Commerce. The trade of W. is mainly with England, and lies chiefly in the export of agricultural produce, butter, pork, bacon, corn, flour, eggs, and live-stock. Steam-navigation has received a great impulse, and there is now a ship-building yard, with patent slip, graving-bank, and dock, on the Kilkenny bank of the river.

W. is originally of Danish foundation; but at the invasion, the city was taken by assault by Strongbow, by whom it was enlarged, and made a place of strength. It received a charter from John, which was forfeited under James I., but restored by

Charles I. in 1626. But few remains of its ancient buildings are now to be seen.

WATER-GLASS, the soluble silicates of potash or soda, or a mixture of both. It is usually prepared by boiling silica with caustic alkali under pressure, about 60 lbs. to the square inch, in a digester. When pure and solid, it has the appearance of common glass, and is slowly soluble in boiling-water. A solution of water-glass is used, mixed with sand, &c., to form artificial stone. It is also spread on the surface of stone to protect it from decay, as it sinks in and cements the particles together; and it enters into the composition of some kinds of cement. In the art of Stereochromy, or Fresco-painting (q. v.), water-glass is now much used. It has also become useful in certain dyeing processes, having in some cases been found to answer the purpose of dunging.

WATER-HEN. See GALLINULE.

WATERLAND, DANIEL, D.D., a clergyman of the English Church, prominent in the theological controversies of the first half of the 18th century. He was born on the 17th February 1683, at Waseley in Lincolnshire, of which parish his father was the rector. After going through the usual course of study at Magdalen College, Cambridge, he was admitted into orders; and in 1713 he became rector of Ellingham, on the nomination of the Earl of Suffolk. It was shortly after this that he published his first book, *Advice to a Young Student, with a Method of Study for the first Four Years*—an unpretentious but useful work, which soon became very popular, and brought its author into notice. King George I. appointed him one of his chaplains in 1717. About this period he began to be engaged in theological controversy, one of his earliest works being a criticism of a book by Dr Whitby, in which a severe attack was made upon Bishop Bull's *Defence of the Nicene Creed*. Whitby answered him; W. rejoined; and in 1719 the latter expanded his writings upon this subject into his *Defence of Christ's Divinity*. This work was sharply criticised by Dr Clarke and other Arians; to whom W. replied in a work published in 1724. Upon the same subject he, in 1720, preached and published a series of sermons at the request of the Bishop of London. Within a few years after this he passed through a rapid course of promotion in the Church. In 1721 he was appointed rector of the parish of St Augustine in the City of London; in 1724 he got the Chancellorship of the Cathedral of York. He was appointed a canon of Windsor in 1727, and Arch-deacon of Middlesex in 1728. He held along with the latter appointments the valuable living of Twickenham. During these years he was indefatigable in controversy; not only keeping up a paper war against the Arians, but entering the lists against free-thinkers, such as Middleton and Tindal, and against those of the Anglican body who did not share his doctrines upon the subject of the Trinity and the Eucharist. *A Critical History of the Athanasian Creed* (1724); *A Review of the Doctrine of the Eucharist* (1737); and *Scripture Vindicated* (1734), are considered among the most noteworthy of his productions. In 1738 were published two volumes of his sermons, edited by one of his friends—the one upon Justification, the other upon the Communion of Infants. W. died on the 23d December 1740. A complete edition of his works, accompanied by a pretty full Memoir of his life from the pen of Bishop Van Mildert, was published at Oxford in 1823, in ten volumes 8vo; an eleventh volume, containing a general index, was added in 1828.

WATER-LILY, a name commonly enough given to the different species of *Nymphaea* and *Nuphar*,

and also of *Nelumbium*, all genera of the natural order *Nymphaeaceæ* (q. v.), and indeed often extended to all the plants of that order. Britain produces three species—*Nymphaea alba*, the White Water-lily; and *Nuphar luteum* and *Nuphar*

White Water-lily (*Nymphaea alba*).

pumilum, called Yellow Water-lilies. The two former are frequent in still waters in most parts of the island; *Nuphar pumilum* is more rare, and chiefly found in Scotland. All have heart-shaped leaves, floating on the water. The beautiful and fragrant white flowers of *Nymphaea alba* float upon the water; the flowers of the yellow water-lily, which are of comparatively little beauty, are raised by their stalks a little above it. The seeds of these, as well as of the Water-lily of the Nile (*Nymphaea lotus*—see LOTUS), are farinaceous, and are sometimes used for food. The Turks prepare a cooling drink from the stems of *Nuphar luteum*.—The SWEET-SCENTED WATER-LILY of North America, *Nymphaea odorata*, has a large white flower of great beauty, and of very sweet smell. Not only *Nymphaea lotus*, but also *N. rubra* and *N. pubescens*, are regarded as sacred plants by the Hindus. *N. cœrulea* was also held sacred by the ancient Egyptians.

WATERLOO' BATTLE OF, the decisive conflict which annihilated the power of Napoleon I., was fought, 18th June 1815, in a plain about 2 miles from the village of W., and 12 miles south from Brussels. Agreeably to the unanimous resolve of the Allies to attack Napoleon on all sides, and crush him as they had done in 1814, British and Prussian troops were stationed in the Netherlands, under the command of Wellington and Blücher respectively, in order to attack France on the north. Napoleon, on his side, well aware that for a considerable time no weighty attack could be made on France except by these forces, and fully recognising the immense advantage to be gained by destroying one enemy before the others could come up, rapidly concentrated the bulk of his troops; and with a suddenness and secrecy which defied all effective counter-preparations, crossed the Belgian frontier, and fell with one part of his forces on the Prussians at Ligny (q. v.), and with the other part, under Ney's immediate command, on the army of the Prince of Orange at Quatre-Bras (q. v.). The Prussians—as Wellington, after learning Blücher's dispositions for the battle, had foretold—were, after a contest of the most obstinate description, completely defeated; but the Prince of Orange, by the aid of the reinforcements promptly forwarded to him by the English commander, succeeded in withstanding Ney's

attack. In the plan preconcerted by the Allied generals such a result was not unforeseen, and in accordance with their scheme of firm resistance and retreat if necessary (to allow time for the Russians and Austrians to assemble on the eastern frontier of France), Blücher retreated northwards (instead of eastwards, as Napoleon expected) nearer the place of rendezvous with Wellington at Mont St Jean; while early on the morning of the 17th, the Anglo-Netherlanders retired along an almost parallel route till they reached the forest of Soignies, in front of which they were formed in battle-array, facing southwards. Napoleon, imagining that the Prussians were in total rout, and that their complete dissipation would easily be accomplished by Grouchy's division (33,000 men), which he had sent in pursuit, crossed to Quatre-Bras with the rest of his troops, and uniting with Ney, marched in pursuit of Wellington, arriving on the plain of W. in the evening.

The two armies which then confronted each other, though nearly equal in strength, were composed of very different materials. The French army, numbering from 69,909 to 72,247 men (according to French authorities, English historians varying in their estimate from 74,000 to 90,000, though its exact strength cannot be ascertained, owing to the loss of the official returns), was composed of veteran troops, who had enthusiastically ranked themselves once more under the standard of the chief who had so often led them to victory. The Anglo-Netherlands army, which numbered 69,894, of whom only 25,389 were British, 6793 of the king's German legion, 10,935 Hanoverians, 6303 Brunswickers, 2926 Nassauers, and 17,488 Netherlanders, consisted, with the exception of a small number of Peninsular veterans, wholly of young soldiers, a large proportion of whom had never been under fire; the Hanoverians were only militia, some of them being fit but for garrison-duty; while the behaviour of many of the Belgian troops during the battle shewed plainly enough that they mainly increased the numerical strength of the army, as they left it to the Dutch soldiers to vindicate the wrongs of the Netherlands. The French had 240, while their opponents had only about 156 guns. With such an army, to maintain even a defensive conflict with an army of veterans, commanded by the greatest general of the time, was a task which (labouring under a mistake as to the exact superiority in number of his opponents) it required all Wellington's rare tenacity of purpose to undertake; yet undertake it he did, depending on Blücher's promise to join him an hour after mid-day.

On the morning of the 18th, the two armies found themselves ranged in battle-array opposite each other: the Allies, posted on a line of eminences, had their left wing resting on Frischermont, the farm-house of La Haye Sainte in front of their centre, while their right wing curved convexly round behind Hougomont, and rested on Braine Merbes. The French were ranged on a parallel row of eminences, having La Belle Alliance in their centre, with some divisions of cavalry and infantry in reserve behind the right wing; Kellermann's dragoons behind the left wing; and the Guard, stationed with the 6th corps, in the rear. Skirmishing had continued all the morning; but the first serious attack was not made till between eleven and twelve, when a part of the 1st corps advanced against Hougomont, with the view of masking the more important attack to be made against the allied left. This preliminary assault, however, though unsuccessful, was maintained with great vigour for a considerable time; till Napoleon, dreading a further loss of time, prepared to make

WATERLOO.

his grand attack on the left centre. At this time (half-past one P.M.), he learned that the advanced guard of the 4th Prussian corps (Bulow's) was appearing in front of St Lambert, 2—3 miles to his right; and being forced to detach his 6th corps (Lobau's) with the reserves of cavalry behind his right wing, to keep them in check, he had to modify his grand plan of attack on the Anglo-Netherlanders, and accordingly ordered Ney to break through their centre. At two P.M., after a furious preliminary cannonade, from which Wellington sheltered his men (as at various other times during the battle), by retiring them to the reverse of the slope, Ney advanced against the left centre with 20,000 men, but had only succeeded in putting to flight a Belgian brigade, when he was attacked and driven back by Picton's division, his retreating columns charged and broken by the English cavalry, and 2000 prisoners taken. Nevertheless, after a brief space, Ney returned to the charge, and carried La Haye Sainte, though his repeated attacks on the infantry in position were constantly repulsed, and his retreating columns severely handled by the British cavalry, who, disordered by success, were as often overthrown by the French cuirassiers. By this time (half-past four P.M.), Bulow had succeeded in deploying from the woods, and, advancing against Planchenoit, in the rear of the French right, carried it after a vigorous conflict. Lobau's corps, however, aided by a reinforcement from the Guard, speedily retook the post, and driving the Prussians back into the wood, secured the French right flank for a time; Napoleon, though now learning that another Prussian corps (the 1st, under Ziethen) was coming up by Ohain to join the Allied left, being still confident that he could destroy the Anglo-Netherlanders before the Prussians could render effective aid. During the conflict with Bulow, Ney had been warmly engaged with the centre and right of the enemy, who had made various attempts to regain the wood of Hougomont and La Haye Sainte, and had supported his repeated attacks with not only his own cavalry, but (by, at any rate, the 'tacit consent' of the emperor) with the cuirassiers, lancers, and chasseurs of the Guard, and the whole of the mounted reserve, without, however, producing any result other than a great slaughter on both sides, and the useless sacrifice of 18,000 of the finest cavalry ever seen. Napoleon now resolved on another vehement assault on the immovable British centre, and directed against it in succession two columns, one composed of four battalions of the Middle Guard, and the other of four battalions of the Middle and two of the Old Guard, supporting them with flank attacks of other infantry divisions, of cavalry, and with a dreadful fire of artillery. The advancing French were met with a well-sustained fire from every piece which could be brought to bear upon them; the first attacking column was fairly driven down the slope by the English Guards, and the second was totally routed by a bayonet-charge of Adam's brigade, the British cavalry following up the fugitives. Ziethen had now (7 P.M.) joined the left of the English line; Bulow, further reinforced, had carried Planchenoit, and was driving the French right wing before him; and the combined attack on the retiring masses of the French by the whole effective force of the Anglo-Netherlanders on the one side, and of the Prussian cavalry on the other, converted an ordinary, though severe defeat into a rout unparalleled in history. The magnificent cavalry, wantonly destroyed by Ney in fruitless attacks upon an 'impracticable' infantry, would then have been of incalculable service, but they were no longer to be had. The last square of the Guard still stood

its ground, to protect the flight of the Emperor; but it was speedily surrounded, and on the soldier-like refusal of Cambronne to surrender, was in a moment pierced through, and broken to pieces. From this time all resistance was over; the roads southwards, especially that to Genappes, were crowded with fugitives fleeing for their lives from the pursuing cavalry; and though the English light cavalry, exhausted with their severe work during the battle, soon ceased the pursuit, it was kept up with great energy throughout the whole night by the Prussian troopers, who seemed bent upon at once avenging the defeats of Jena, Auerstadt, and Ligny, and glutted their fierce animosity by an indiscriminate slaughter. The total loss in this battle was, from the obstinacy and determination with which it was contested, necessarily large; the figures are: British and Hanoverians, 11,678; Brunswickers, 687; Nassauers, 643; Netherlanders, 3178; a total of 16,186; which, added to 6999 Prussians, gives the aggregate allied loss, 23,185. The French had 18,500 killed and wounded; 7800 prisoners (some French accounts raise the total list of *hors de combat* to 32,000), and 227 cannon captured.

This great battle has given rise to numerous controversies among the British, French, and German historians of the great struggle between Europe and Napoleon—the points in dispute being, (1) as usual, the numbers engaged on each side, (2) the ability shewn by each general in his dispositions for the conflict, and (3) the relative share of the British and Prussians in producing the final result. These questions can be briefly and satisfactorily answered. The strength of the English army is known from official estimates; the French army, as shewn by its manœuvres throughout the day, was more numerous, and though its amount cannot, with perfect accuracy, be ascertained, it was certainly over 70,000, and under 80,000; but the fact that many Belgians in the Duke's army took to their heels as soon as the French marched towards them, and fled direct to Brussels, increased the disproportion, already sufficiently great, between the two armies; the Prussians had only 35,000 men under fire at W., and half of these only for about half an hour. Fault has been found with Wellington for giving battle in front of a wood, but the accusation is foolish, as several good roads traversed the wood, thus affording means of retreat, if necessary, and the wood could have been held by skirmishers to protect the retreating infantry. Napoleon's faults were chiefly—the late hour at which he (not calculating on the arrival of the Prussians at all, and certainly not without Grouchy) commenced the conflict, and the reckless manner in which his cavalry reserves were wasted; and his neglecting to take into account the steadiness—a steadiness new to one of even his experience—with which, as he was warned by Soult, who knew it only too well, the British infantry were wont to maintain their ground. As to the third point, there is no doubt that Bulow's attack on Planchenoit distracted Napoleon's attention, and drew off 10,000 of his forces; but though the Prussians had not come up, the battle could not have been otherwise than a drawn battle; however, the effect of their successful attack on the French right, by taking in flank also the squadrons which recoiled before the invincible steadiness of the British, was the conversion of an otherwise drawn battle into a glorious victory. Each of the three nations claims its right to give name to this famous conflict—the French calling it after Mont St Jean, a château in rear of the British line; the Prussians after La Belle Alliance; while the true victors on the bloody field assert their

rightful claim, and will hand it down to all future ages as the *Battle of Waterloo*.

WATER-MARK. The manufacturer's mark on various kinds of paper. See **PAPER**.

WATER MELON. See **MELON**.

WATER OUSEL. See **DIPPER**.

WATER-POWER. The value of water-power depends much on the nature of the source of supply, whether steady or otherwise. Where streams supplying water-power are liable to fall off much in dry weather, large impounding reservoirs are necessary to keep the mills from being stopped during summer. These, however, being generally expensive concerns, are seldom made for one mill, but rather by some association of mill-owners; and often by a water-company or commission for supplying a town with water, to afford compensation to the mills by storing up flood-water, for what is abstracted for the use of the town. On small streams, there is generally a pond provided fit to hold a night's water, or, perhaps, even a Sunday's, in addition; but in the case of large rivers, there is, in general, only a weir or dam across the river to direct the water into the intake lade. When the inclination in the bed of the stream is small, the lades require to be proportionally long, to give sufficient fall, and are often above a mile long or more from the intake to the lower end of the tail or discharge lade, where the water is returned to the stream. The rise and fall of the tide has been frequently used for driving water-wheels.

The most usual, and generally the most eligible, mode of applying water to the driving of machinery is by means of a vertical wheel; and the wheel is put in motion either by the water acting on blades or floats by impulse derived from its velocity acquired in falling, or by the weight of water being applied to one side of the wheel. The former mode of applying the water is generally adopted in low falls, say under six feet or thereabout, and to what is called an undershot wheel—i. e., a wheel where the effective head of water is below the level of the centre; and to make the application efficient, that portion of the periphery of the wheel measuring from the point of impact of the water to a point directly below the centre, requires to be surrounded by a casing generally of stone, but sometimes of cast-iron, called the arc, closely fitted to the extremity of the floats, so as to prevent any considerable escape of water.

The wheel, which may be either of timber or of

Fig. 1.

cast-iron, or partly of both, consists (fig. 1) of axle, a; arms, b; floats, which are generally radii of the

circle, but are sometimes set a little obliquely to the radius, pointing up stream, c; and generally there are also a sole, d, being a lining round the circumference at the lower edge of the floats, having openings for the escape of air; and a shrouding or circular plate, e, at each side of the wheel, and of the same depth as the floats.

Sometimes, when there is very little fall beyond the mere current of the stream, the floats simply dip into the water like the paddles of a steamer, in which case, no sole or shrouding is required; and to make allowance for the rise of the water in the tail-lade during floods, which is generally called *back-water*, and seriously impedes and sometimes stops the motion of the wheel, occasionally the wheel and its arc are so constructed as to be capable of being raised or depressed together, without throwing the machinery out of gear. This is done in the case of the Inverness water-works, where the wheel is liable to be much affected by the rising and falling of the river Ness.

Sometimes, in this country, and often on the continent, the machinery is all on board a vessel moored in a river, so as to rise and fall with the level of the water, and thereby keep its water-wheel always immersed to the proper depth. At the old London Bridge water-works, the wheels which rose and fell with the tide were worked by the current of both the flood and ebb.

The other mode of applying the water to a vertical wheel by making it act by its gravity, is the more perfect and economical mode, where circumstances will admit of it, and is generally adopted in falls of any considerable height, say of six feet and upwards, and where the water can be let on above the level of the centre. The wheels are called respectively *breast* and *overshot wheels*, according as the water is let on more near to the level of the centre or to the crown of the wheel; and they have, instead of straight floats, curved or kneed buckets, according as they may be made of iron-plate or of wood, and of such a shape as to retain the water down to the lowest possible point. There are generally in good wheels

Fig. 2.

ventilating openings in the sole for the escape of air. The overshot wheel has this disadvantage that, as the water has little or no power until considerably past the top centre, the wheel is burdened with a useless weight of water.

The direct overshot wheel has the water run,

without changing its direction, right over the top, as in fig. 2; which arrangement has this advantage that, as the top of the wheel moves in the same direction as the stream, it gets the benefit of the whole initial velocity and impulse of the water; but, on the other hand, the bottom of the wheel, if at all immersed in water, which it generally is to some extent, meets with obstruction by moving against the current.

The *pitch-back overshot* is a modification of the last, making the water to pass alongside the wheel, and then to return and be let on the top of the wheel in a contrary direction, as in fig. 3. This requires longer and more complicated troughs, and by the change in direction, part of the impulse from the water is lost, but the bottom of the wheel moves in the direction of the tail-water, and is not liable to be impeded by being immersed in it.

On the whole, it is generally thought better to apply the water at about 30 degrees from the top of the wheel. In such high-breast or nearly overshot wheels, the water is let on to the buckets over the top of the sluice, which is made to open by lowering, and shut by lifting, as in fig. 4. In this way, however small may be the quantity of water, it is always applied at the highest possible level, which is of importance when it is its weight multiplied by the height of descent, and not its impulse, that yields the effective power.

The structure of the overshot and breast wheel is nearly the same as that of the undershot, excepting in the substitution of curved buckets, as in figs. 2 and 4, or angular buckets, as in fig. 3, for straight

Fig. 3.

floats; but even in the undershot wheel the floats are sometimes made with a slight curvature.

In any description of wheel, the motion may be taken off the axle by torsion, which necessarily requires rigidity in the arms, as in figs. 1 and 3; or it may be taken directly off the periphery, when the

power is applied to a pinion P, working into segments either external, as in fig. 2, or internal, as in fig. 4, attached to the shrouding. In this arrange-

Fig. 4.

ment, there is no torsion of the axle, or transverse strain on the arms, and therefore the latter are more often made of round wrought-iron rods, with a slight axle. This wheel is much lighter than with the massive axle and the strong wooden or cast-iron arms, and is called a *suspension* or *spider wheel*.

In reckoning the power of water, its weight being 62½ lbs. to a cubic foot; theoretically, 528 feet, falling vertically 1 foot a minute, would be equal to 1 Boulton and Watt horse-power of 33,000 lbs. lifted 1 foot a minute; but the effective power is far short of that, and 60 per cent. of it, requiring 880 cubic feet, falling 1 foot a minute, is generally reckoned a fair allowance for an effective horse-power. Seventy-five per cent., requiring 704 feet, falling 1 foot a minute, is about the highest that has ever been spoken of, and it is doubtful whether even more than 70 per cent. has ever been attained; while with low falls and imperfectly constructed wheels, it is often reckoned that a horse-power requires nearly 1000 cubic feet a minute.

The velocity of the periphery of an undershot wheel is usually from 500 to 600 feet a minute, and that of a bucket-wheel, overshot or breast, from 300 to 450 feet. It is seldom that the whole height of a fall can be advantageously made use of; for if the wheel be placed so low as to get the benefit of the whole height of the fall in low states of the water, very often it is liable in floods, to have the lower rim immersed, and to be obstructed or stopped by back-water.

The most extensive application of water-power to one work in Scotland, or probably in Britain, is that of Deanston Cotton Mills, on the river Teith, 6 miles above Stirling, where there are in one house four wheels, 36 feet in diameter, and 12 feet in breadth, and having a volume of water of 8½ millions of cubic feet in 10½ hours a day—falling 33 feet a minute. The most systematic application of water-power, however, is probably that of the Shaws Water-works, now the property of the corporation of Greenock. There the yield of nearly 7000 acres of hill-ground is stored up in reservoirs of a capacity of 320,000,000 of cubic feet, and conveyed by an aqueduct of about 6 miles in length to the outskirts of Greenock, which it reaches at the level of 512 feet above the level of the sea, and is then divided into two lines of falls, one having

1200 cubic feet a minute for 12 hours a day, and the other the equivalent quantity of 1066 feet for 13½ hours a day, divided each into 19 falls, for which those already appropriated pay per annum from £1, 15s. to £4, 5s. per horse-power, according to their distance from the centre of the town, and their height above its level. One foot of fall for each line is reckoned 1·8 horse-power, which is a very high computation, being 79·2 per cent. of the theoretical horse-power. At the 'Cotton Mill,' where both lines of falls are combined, there is the largest, or nearly the largest water-wheel in existence. It is 70 feet 2 inches in diameter, 13 feet wide, with 166 buckets, having a depth of 17 inches. It has 2266 cubic feet of water per minute, with a fall of 64 feet 4 inches, and is therefore nearly 200 horse-power. By the Shaws computation, it would be 218 horse-power. It is a spider wheel, taking the power off the circumference.

Of horizontal wheels: In the proper turbine (from *Ital. turbino*, a whirlwind), the water passes either, first, vertically down through the wheel between fixed screw-blades, which give it a spiral motion,

Fig. 5.

and then strikes similar blades attached to a movable spindle, but placed in the opposite direction, so that the impact of the water communicates a

Fig. 6.

rotatory motion to the blades and spindle, as shewn in fig. 5, and in fig. 6 an enlargement of the parts, the fixed blades being marked *a, a*, and the movable

portion of the machine *bb*; or, second, a modification of the foregoing is to pass the water from the

Fig. 7.

centre horizontally outwards through fixed curved blades, *a, a*, figs. 7 and 8, so as to give it a rotatory

Fig. 8.

or tangential motion, and thereby cause it to act on the blades of the wheel, *bb*, which revolves outside.

Fig. 9.

In the reactionary wheel, which is in principle almost identical with Whitlaw and Stirret's wheel,

previously described under the article BARKER'S MILL, the water is admitted at the centre of the wheel from below, passes to the circumference between curved blades of the wheel, and escapes by tangential orifices at the circumference, there being

Fig. 10.

valves made to open more or less, according to the quantity of water and to the power required. This form of turbine is shewn in figs. 9 and 10, where the water enters at *aa*, and escapes by *bb*.

The vortex wheel of Professor Thomson (figs. 11

Fig. 11.

and 12) takes in the water after descending through the tubes, *a, a*, at the circumference, where, by means of fixed blades, *b, b*, it acquires a tangential

Fig. 12.

motion, and then passes through between the curved arm, *cc*, of the wheel, and escapes at the centre,

dd. As the two last described wheels work always under water, they are not liable to be obstructed by back-water, or to have their power lessened thereby more than what is due to the diminished fall, and they are understood to yield a good percentage of power, sometimes stated at 75 per cent.; but all turbines are somewhat delicate, and liable to be choked by leaves or twigs, unless the water be carefully strained. Although only a few horizontal wheels have been described, their name is legion, and it would take a book to mention them all, or to describe their respective merits.

The reciprocatory hydraulic engine, as shewn in fig. 13, works exactly on the same principle as the ordinary non-condensing steam-engine. The water,

Fig. 13.

under considerable pressure, is admitted at one end of a cylinder, *a*, the exit valve, *d*, at that end being simultaneously closed, while it is shut off from the other end, and the exit valve, *d*, there opened; and so the alternating action of the valves and of the piston goes on continuously. To work smoothly and effectively, the piston ought to be of large diameter, in proportion to the length of stroke, and to go slowly; otherwise the quick jerking is apt to shake and to injure the engine; and generally it is better to have two cylinders and pistons working together, as that enables them to work more equally, and to turn the crank without the use of a fly-wheel.

Both the turbine and the reciprocatory engine have been made use of as water-meters.

The turbine and the reciprocatory engine have the advantage of being able to take the use of a fall much greater in height than the diameter of the largest wheel that can be made; but for all ordinary falls, a good breast or overshot wheel,

or even an undershot, is, on the whole, generally considered better.

WATER-PROOFING. See CAOUTCHOUC. Besides the application of caoutchouc, peculiar methods have been employed to render cloth impervious to water, at the same time allowing the passage of air, the absence of this property in the impermeable caoutchouc manufactures having been found disadvantageous. Two plans are adopted for water-proofing woollen cloths, without rendering them quite impervious to air—the first is to dip the cloth into a solution of soap, and thoroughly rub it into the texture, after which it is dipped into a solution of alum; a decomposition of the soap and alum is effected, and the minute openings between the fibres are in some way partly filled so as to exclude water. In the second plan, the cloth is dipped into a solution of gelatine or isinglass, and afterwards in a solution of galls. A kind of tanning process is the result, the gelatine which has pervaded the cloth being rendered as insoluble as leather by its union with the tannin of the galls.

WATER-SPOUT. See WHIRLWIND.

WATER-SUPPLY. Water is one of the primary wants of human life, no less essential than air and food; hence the strong and religious interest that has always been attached to the means of its supply. In the earliest records of civilisation, we read of the digging of wells, and of quarrels about the possession of them. The 'Pools of Solomon,' near Bethlehem, which remain now almost as perfect as when they were built, were connected with a scheme for supplying Jerusalem with water. In Assyria and Persia, from the earliest times, water has been conveyed to towns from astonishing distances in open channels or canals, and in subterranean tunnels, or *kanats*. In Egypt also, and in China, gigantic works for conveying water, both for domestic use and for irrigation, have been in existence from remote antiquity. Nor were these undertakings confined to the eastern hemisphere; we have evidence of the existence of kindred works in pre-Christian America. The ancient city of Mexico, which was built on several islands near the shore of the lake, was connected with the mainland by four great causeways or dikes, the remains of which still exist. One of these supported the wooden aqueduct of Chapultepec, which was constructed by Montezuma, and destroyed by the Spaniards when they besieged the city. Hydraulic works on a great scale had also been executed by the Incas of Peru. Of all the ancient nations, the Romans paid the greatest attention to the supply of water, and carried the construction of *aqueducts* to the greatest perfection and magnificence. If we except the supply of New York from the Croton river (see *AQUEDUCT*), and that of Glasgow from Loch Katrine, the efforts to supply modern cities are as yet insignificant compared with those of the Romans. The last-named works, finished in 1858, convey 19 million gallons a day a distance of 26 miles. It is only since the beginning of the sanitary movement, occasioned by the repeated visitations of cholera beginning with 1832, that the subject of water-supply, and more especially the *quality* of water-supply, has seriously occupied public attention. The result of every inquiry and every day's experience has been to bring out more strongly the decided effects on the health of a community arising from the quantity and quality of the water at their command; and as the river and surface sources of supply near the chief seats of population are becoming every year more contaminated by Sewage (q. v.), the drainage from manured land, the droppings of animals, and the refuse of manufactures, enterprise and engineering skill must

be directed either to procuring a supply of pure subterranean spring water from the chalk or other absorbent strata, or to bringing pure water from greater distances than hitherto. Already it is suggested to bring water to the metropolis from the flanks of the mountain ranges of Cader Idris and Plinlimmon in North Wales, from which the river Severn is supplied. According to Mr Bateman's plan, which he has elaborated in considerable detail to shew the practicableness of the scheme, the water would be conveyed for the most part in an open aqueduct, 173 miles long, and capable of carrying 220 millions of gallons a day, to service-reservoirs on the high land near Stanmore, about ten miles from London, from which it would be delivered, at high pressure, by means of pipes, to the whole city. The initial cost he estimates at £8,600,000. If this project is carried out, it will far outstrip the greatest works of the Romans on their own plan. There are rival schemes for taking the supply from the Lake districts of Cumberland and Westmoreland. Owing to the exceptionally great rain-fall in these regions (140 inches on an average), it is calculated that the two lakes of Ullswater and Haweswater, with a drainage of 100 sq. m., receive together an average daily discharge of 550 million gallons. From this water, which is very free from mineral matter, there are proposals to supply not only the metropolis, but the principal towns of the north-west of England—Liverpool, Leeds, Bolton, Bury, Blackburn, Huddersfield, &c. The proposal also has been revived, made in 1840 by the late Robert Paton and the late Robert Stevenson, to supply the whole of the metropolis with softened spring-water to be derived from the chalk strata in the vicinity. Recently, a covered conduit, 80 miles long, has been constructed, which conveys 8 million gallons of pure chalk spring-water from the sources of the Dhuis, in Champagne, to Paris; and operations are going on to bring the chalk springs of the Vanne, calculated to yield 22 million gallons a-day, also to Paris, a distance of 104 miles.

The chief points of interest on this subject may be arranged under the heads of the Sources of Supply, the Qualities of Water, and the Arrangements for its Conveyance and Distribution.

Sources of Water.

The ultimate source of all *fresh* water is Rain (q. v.). When it has fallen on the earth, it presents itself chiefly in the forms of surface-water, rivers, and springs.

Surface-collection.—Rain-water, as it is formed in the upper regions of the atmosphere, is the purest that nature supplies; but in descending, it brings with it whatever impurities are floating near the surface, which, in the neighbourhood of towns, are numerous, consisting of various gases, together with soot and other floating particles, organic and inorganic. Rain-water has a strong affinity for organic impurities—that is, the corrupting ingredients derived from vegetable and animal bodies, and which are diffused over every surface in the vicinity of living beings; hence, when collected from the roofs of houses, it has a tendency to rapid putrefaction. Being free from saline ingredients, it is excellent for washing, but is not generally pleasant to drink.

But if we resort to a barren district of rock or sand, destitute of vegetation, and remote from the pollution of towns, we may obtain water with comparatively little organic impurity. Notwithstanding several defects, it happens in various places that a surface-supply is the best that can be had.

Rivers.—The water obtained from running streams is in part what has flowed immediately from the

surface, and in part the water of springs, shallow or deep. In any case, a considerable amount of contact with the ground has taken place, and in consequence saline and organic matter is liable to be dissolved in a greater or less degree. The extent of the impregnation, as well as the kind of material dissolved, will depend on the rocks and strata of the river-basin.

River-waters, besides the qualities they derive from their primitive sources, are apt to contain mud, decayed leaves, the exuviae of fish, and other matters in suspension, and are thus deficient in the clearness and transparency so essential to the satisfaction of the eye in a drinking-water. Moreover, the water partakes of the extremes of summer and winter temperature. But the great objection to water from rivers is their general pollution from the manure used upon the land, sewage, and manufactures, so that there are now few rivers left from whose lower course a supply could be taken for domestic purposes. On the other hand, the supply from one of our large rivers is boundless and unailing; and it conveys the surface-drainage and spring effusions of a large tract of country, without incurring any trouble or expense as to the original sources. Rivers that issue from lakes are generally the purest, as the suspended matter has time to be precipitated.

Springs.—The qualities that recommend water to the eye and to the palate belong in a pre-eminent degree to spring-water (see *SPRING*): it is clear, sparkling, and of an agreeable and uniform temperature at all seasons of the year (about 50° Fahr.); it is well aerated, and is totally free from the offensive taint so common in all other waters, as well as devoid of the animalcules generated by organic impurity; and where a sufficient number of springs can be collected to suffice for a town, it is the most desirable of all sources of supply. Three-fourths of the water brought to Edinburgh is spring-water collected on the slopes of the Pentlands.

Quality of Water.

Perfectly pure water is hardly to be found; rain-water, and even artificially distilled water, are only approximates. The chief impurities may be considered under the heads of Mineral Matter in Suspension, Mineral Matter in Solution, and Organic Matter.

Mineral Matter in Suspension.—When running water comes upon a loose bottom, it carries the finer particles of sand and earth along with it. If the water comes into a position of perfect stillness, the matters thus floated gradually sink to the bottom again, with the exception of particles of clay, which, owing either to their excessive fineness or to their adhesive attraction for water, are incapable of being satisfactorily separated either by subsidence or filtration. Besides earthy matter, compounds of iron and lead are also in some circumstances present in a solid state, and may be got rid of by filtering. To separate clay-powder from water, the practice has long been resorted to in India and China of putting in a piece of alum, which seems to produce a kind of coagulation.

Dissolved Mineral Matter.—Spring-water, which is generally clear and sparkling, holding no solid matter in suspension, is seldom without a large amount of dissolved mineral matter, sometimes as much as 2 parts in 1000, commonly from 1 in 1000 to 1 in 20,000. River and surface water also contains more or less dissolved minerals (see *MINERAL WATERS*). The great bulk of the solid matter held in solution in ordinary waters consists of the salts of soda, potash, lime, and magnesia. The most material are the salts of lime and magnesia, as they are the

causes of what is called 'hardness' in water, which we shall speak of more particularly afterwards. The most important salt of lime is the *bicarbonate*, which is derived from chalk or limestone. Chalk or limestone is a *carbonate* of lime—that is, a compound of lime with one equivalent of carbonic acid—and is almost insoluble in water; but when water containing an excess of carbonic acid—as is the case with spring-water especially—passes over limestone, it gives the carbonate a double dose of carbonic acid, and converts it into bicarbonate, which is soluble. The waters having bicarbonate of lime for their chief impurity, are familiarly spoken of as the chalk-waters. The other salt of lime often present in water is the *sulphate* or *gypsum*. The important distinction between the bicarbonate and the sulphate lies in the fact, that the first, the bicarbonate, may be in great part precipitated, or thrown down in a solid form, by boiling, which drives off the solvent carbonic acid; whereas the second, the sulphate, cannot be so precipitated. The chief effect of the boiling takes place in the first five minutes; but it may be increased by continuing it for fifteen minutes or even an hour.

Apart from its hardness, it has been made a question whether water containing salts of lime is injurious or not to the human constitution. Dr Lankester holds that there is evidence to prove that carbonate of lime in large quantity is positively injurious; and most physiologists are agreed that pure water is the best for securing the health of animals and man.

With regard to magnesia, its salts are well known to act as powerful medicines when taken in large doses, and it may be presumed are not altogether without effect in the small quantities existing in ordinary magnesian waters. A foreign physician has lately made the observation, that magnesia is the characteristic ingredient of waters in the districts where the diseases called *cretinism* and *goitre* abound.

—Of salts of *soda* and *potash*, the principal is common salt, or the muriate of soda. Sulphate of soda (Glauber's salt) occurs along with the muriate in the salt-springs of watering-places as well as in the sea-waters. None of all these salts have any effect on the hardness. In the case of sea-water, which is very hard, the effect is not due to common salt, but to the lime and magnesian salts dissolved in it; were it not for these, sea-water would be perfectly suitable for washing, although not for drinking.—Salts of *iron* in considerable quantity make what are technically named *chalybeate* waters, which belong to the medicinal class. When the iron exists in the spring as carbonate, which is the most usual case, on exposure to the air, it is changed into the peroxide, and falls down in the form of an ochery precipitate. Salts of iron give an inky taste to the water, and a yellowish tint to linen washed in it.

Hardness in Water.—The quality of hardness in water is commonly recognised by the difficulty experienced in washing, and by the amount of soap necessary to form a lather. This quality is injurious also in the preparation of food; but its action is most universally felt in washing operations. It occasions the chapping of the skin, an enormous waste of soap, an extra labour, and a corresponding tear and wear of clothes. Every grain of chalk contained in water decomposes 10 grains of soap; and thus the hardening matter contained in 100 gallons of water, such as is supplied to London, will destroy 35 ounces of soap—that is, the first 35 ounces of soap added to this quantity of the water will disappear without forming any lather, or having any cleansing effect. Soap is a compound, formed of an alkali (soda or potash) joined to an oily acid. When a salt of lime,

then, is present in the water, the lime decomposes the soap, and combines with the oily acid to form a lime-soap, which is insoluble, and has no detergent properties.

The most usual hardening ingredients are the salts of lime. Salts of magnesia and of iron are also hardening salts. Salts of soda and potash have no hardening effect. Dr Clark, formerly Professor of Chemistry in Marischal College, Aberdeen, has devised a scale of hardness which is now universally employed in the chemical description of waters. The hardening effect that would be produced by one grain of chalk dissolved in a gallon of water is one degree of hardness; in like manner, four grains per gallon would produce four degrees of hardness; ten grains, ten degrees; and so on. The degrees are expressed in numbers—thus, 1°, 4°, 10°, 15°, are one, four, ten, fifteen degrees respectively. The degree of hardness of any particular water can be readily and exactly determined by Dr Clark's Soap Test (q. v.).

Next to washing, the deleterious consequences of hardness are felt in various culinary operations, especially in the furring of boilers and cooking utensils, and in the infusion of tea. It is a fact of universal experience that hard water requires more tea than soft water to make an infusion of the same strength, and also renders the infusion muddy. Sub-carbonate of soda in crystals, by decomposing the earthy salts, improves the water; but if more is added than what will exactly decompose the earthy salts present, it injures the fine flavour of the tea. It may be stated generally, that for the purposes of washing and cooking, a water of less than 6° is soft, but above this point the hardness becomes objectionable. At 8°, the water is moderately hard; at 12°, it is very hard; at 16°, the hardness is excessive; and much above this, it is intolerable.

To make these observations more intelligible, we may mention a few instances of known waters, with their place in the scale. In Keswick, the water is under half a degree of hardness; in Lancaster, it is 1½°; and in Manchester, 2°. The water of the Dee at Aberdeen, which is used for the supply of the town, is 1½° of hardness. The water of Loch Katrine is of remarkable purity, having only two grains of solid matter of all kinds in the gallon, and 1° of hardness. The waters of the Welsh mountains, from which it is proposed to supply London, have on an average less than 2°. The river Clyde, which formerly supplied Glasgow, is 4½°, and may also be reckoned a soft water. The Thames at London, as well as the New River, is about 13°, while many of the tributaries of the Thames rise as high as 16°; but being all chalk-waters, they may be materially softened by boiling. Springs from the chalk commonly range from 16° to 18°; but particular springs are to be met with in some parts of the world four or five times as hard, from the presence of bicarbonate of lime. The water of the Treasury pump in London has from 50° to 60° of hardness. In many parts of the continent, hard waters abound; but the testing of waters has not been so much attended to there as in this country.

From an extensive examination of the waters of England and Wales, made some years ago by the General Board of Health, it appears that in England the hardness of springs in general is considerable; that a very large number of rivers have an injurious and exceptionable amount of hardness (13°·05); and that surface-waters may be collected in a state that is to be considered soft (4°·94).

Lead in Water.—Injurious effects have frequently arisen from the contamination of water with lead, derived from leaden pipes and cisterns. Some kinds of water are known to act powerfully on a leaden

surface, and others scarcely at all; but the qualities and circumstances on which the action depends have never been satisfactorily determined. Distilled water, and soft lake and river waters in general, act most decidedly, but by no means in proportion to their softness. The presence of air in the water seems one essential condition; light also increases the action, as does the presence of vegetable matter; it has been observed that when leaves drop by chance into a lead cistern, the spots where they lie become visibly corroded. The water of Loch Katrine, according to extensive sets of experiments by distinguished chemists, is allowed to have an intense action* on lead under certain circumstances—viz., '1st, If the lead be bright and highly polished; and 2d, If the lead and water be freely exposed to the access of air.' But it 'does not exert any noxious action on lead when the metal is in its ordinarily dull state.' The coating formed on the surface of the metal is held to protect it from further chemical action. Still there are opposing facts to shew that this protective action is not always to be relied on; and that water that has passed through any considerable length of lead pipe, or stood for some time in a short one, or in a cistern, should never be used without care; a ninth part of a grain of lead per gallon has been known to derange the health of a whole community. Dr Clark made the unexpected discovery that sand-filters completely separate the lead.

Organic Impurities.—The contamination of water by vegetable and animal substances takes place in various ways. The most obvious and abundant source of this class of ingredients is the sewage and refuse of towns; and next in order may be ranked the contact with soils rich in organic matter. Among organic impurities may be classed offensive gases, such as carburetted, sulphuretted, and phosphuretted hydrogen; vegetable fibres in a state of rotteness; putrefying products of the vegetable or animal kingdoms; starch, muscular fibre, &c.; urea and ammoniacal products; vegetable forms—algæ, confervæ, fungi, &c.; animalcules—infusoria, entomostrea, annellidæ or worms, &c. Water falling on a growing soil, and running off the surface to lie in stagnant ponds, is in very favourable circumstances for being tainted with vegetable and animal life. Water-plants will spring up and feed numerous tribes of animalcules, and each pool will be a constant scene of vitality. In such a state, the water is usually unfit for drinking; the palate instantly discerns a disagreeable taint, and no one will use it who can do better. The surface-water of a district overgrown with peat-moss has usually a peaty flavour, as well as a dark and dirty colour. The infusion of peat does not breed animalcules, being a strong antiseptic; but it is an objectionable ingredient nevertheless. Very slow filtration has been found to remove the colour of the infusion in some degree, but not entirely. Lime removes the peat most effectually, but there is both expense and risk in applying it. It is perhaps doubtful whether any specific unwholesomeness can be justly attributed to peat-water; but it is unpalatable, and the use of it is shunned by the inhabitants of peaty districts, and even by cattle. The presence of peat in the lands used as collecting-grounds for surface-water—and it is generally such worthless tracts that are so employed—is a disadvantage attending that mode of supply.

* The water of Loch Katrine is remarkably well aerated, having 7½ cubic inches of air per gallon, of which 2½ inches are oxygen. Dr Clark has a suspicion that the oxygen may turn out to be in some different state or modification from common oxygen.

Chalk-water, which, as it issues from a spring, is perfectly free from organic matter, has a source of contamination within itself. When exposed to light and air, the duplicate dose of carbonic acid that keeps the chalk dissolved, becomes decomposed; and the carbon of the decomposed acid gives rise to a green vegetation, which soon acquires an offensive maraly smell.

Organic matter in a putrefying state forms the worst kind of contamination that water can have. Though we may not know the precise effects of these impurities on the animal system, the single fact of their rendering the water repulsive to the taste and nauseous to the stomach would be sufficient to condemn their use. What is disagreeable to the senses, must be presumed to be unwholesome in addition, until the contrary is proved. Though no one has ever yet gone the length of maintaining, as a general truth, the wholesomeness of water abounding in vegetation, insects, and decaying matter, yet the water of the Thames, even within the influence of the tides, where it is contaminated by the whole sewage of the metropolis, found defenders until lately, on the plea that the amount of impurity was too small to do harm. This ground is at length given up; but Thames water above Teddington Lock is still sanctioned as safe water for the companies to supply to the inhabitants of London, notwithstanding the sewage of the numerous populous towns that the river receives above that point. As to this plea of smallness of amount, the highest medical authorities hold that it is impossible to say how small a quantity of organic matter in a state of fermentation may not do harm. We are not, however, left merely to presume that organic impurity in water is prejudicial to health. During the cholera visitation of 1853—1854, a gigantic experiment was undesignedly made on half a million of human beings. It so happened that a certain district of London was supplied by two rival water-companies, the two mains running often side by side, and some houses taking water from the one, and some from the other. The whole inhabitants were living alike in all respects save one—viz., that one company drew its water from high up the Thames, where it was of comparative excellence, while the other drew its water from low down the river, where it was profusely contaminated with town-drainage. Among this population, there were more than 4000 deaths from cholera; and when the epidemic had subsided, an inquiry was made, house by house, as to those deaths, and as to the water-supply of the several houses where they had occurred. The inquiry was conducted with every precaution, to avoid sources of fallacy; and the result was this: in the one set of houses, the mortality per 10,000 of the population was 37; in the other set of houses it was 130—that is to say, the cholera death-rate was 3½ times as great in the one set as in the other.

It is a common notion that *every drop of water teems with life*; but this is a mistake. Deep wells, and spring-water in general, contain little or no living organic matter. Consequently, it is quite possible to obtain a liquid perfectly free from animalcules and vegetation. The presence of living creatures, vegetable or animal, discernible either by the naked eye or by the microscope, is a proof of organic taint in the water, and is one of the tests of this kind of impurity. With respect to rain-water, Dr Hassall states, in his evidence before the General Board of Health: 'I have made several examinations of rain-water immediately after its descent to the earth, obtained in both town and country, and can confidently assert that it does not, in general, contain any form of living vegetable or animal

matter.' The conditions necessary for the development of vegetation and animalcules over and above the presence of matter for them to feed on, are *air, light, and stillness*. With regard to the probable effects on health of living creatures contained in water, Dr Hassall's observations are worthy of attention: 'All living matter contained in water used for drink, since it is in no way necessary to it, and is not present in the purest waters, is to be regarded as so much contamination and impurity—is therefore more or less injurious, and is consequently to be avoided. There is yet another view to be taken of the presence of these creatures in water—viz., that where not injurious themselves, they are yet to be regarded as tests of the impurity of the water in which they are found.'

Means of purifying Water.

The mechanical impurities of water, or the solid particles rendering it muddy or milky, may in most cases be removed by mechanical means. The two processes for this purpose are *subsidence* and *filtration*. The effects of subsidence are strikingly seen in the case of rivers that pass through lakes. See GENEVA, LAKE OF. The subsidence of solid particles depends on their own weight, as compared with the weight of an equal bulk of water. To favour the process, the most perfect stillness should be allowed. It is expedient to have partitions placed in the subsiding reservoirs at short intervals, more effectually to prevent the agitation of the water. The water should be run off from the top, and not from the bottom. By making the bottom of the subsiding reservoir form a declivity from opposite sides, and providing means to let off the water occasionally from its lowest depth, it is possible to get quit of the subsided mud. It is always found of advantage in clearing water from solid particles, whether by subsidence or by filtration, to mix together streams of different qualities.

In constructing an artificial filter on a large scale, a basin is formed, having the floor nearly level, but slightly inclining towards a centre line, and made water-tight by puddling the bottom and sides with clay. On the floor is laid a series of layers of gravel, coarse at first, and getting gradually finer upwards; next, a layer of slate-chips or sea-shells, then one of coarse sand, on which is placed the actual filtering layer of fine sand. The depth of this layer is from twelve to thirty inches, that of the entire mass from four to six feet. The water being admitted gently on the top of the sand, sinks down and is conducted by a series of channels, generally of tile-pipes, into the main drain. A filter in a clean state will pass from twelve to eighteen vertical feet of water in twenty-four hours. The solid matter intercepted does not penetrate more than three-fourths of an inch into the sand, so that, by removing a very thin film from the surface, the filter is again clean. What is scraped off the top, is capable of being washed and put again to use. 'This process of filtration,' says Professor Clark, 'is efficacious in removing mechanical impurities to an extent that could scarcely be believed without seeing the process.'

The cleansing power of sand can hardly be accounted for on the theory of mere mechanical interception. Though there is no chemical action, strictly speaking, there is no doubt that the attraction of adhesion is at work—a power that plays a greater part in natural processes than has generally been assigned to it. Some substances manifest this adhesive attraction more strongly than sand, and have therefore still greater efficacy as filters; though practically, and on the large scale, sand is the most eligible. Powdered charcoal has long

WATER-SUPPLY.

been known as a powerful filtering medium, attracting and detaining especially organic matter. Animal charcoal, or that derived from burning bones, is still more efficacious than wood charcoal. A filter of animal charcoal will render London porter almost colourless.

According to recent researches, it would seem that loam and clay have similar properties, and may be made available as filters. Professor Way states that 'they have powers of chemical action for the removal of organic and inorganic matters from water to an extent never before suspected.' The filthiest liquids, such as putrid urine and sewer-water, when passed through clay, dropped from the filter colourless and inoffensive. The clay used was that known as pipe-clay.

For filters for domestic use, see FILTER.

Softening of Water rendered Hard by Chalk—Clark's Process.—This is one of the most beautiful applications of science to the arts of life that could perhaps be named. We extract the inventor's own account of it, as given in a paper read before the meeting of the Society of Arts:

'In order to explain how the invention operates, it will be necessary to glance at the chemical composition and some of the chemical properties of chalk; for while chalk makes up the great bulk of the matter to be separated, chalk also contains the ingredient that brings about the separation. The invention is a chemical one for expelling chalk by chalk. Chalk, then, consists, for every 1 lb. of 16 oz., of lime, 9 oz.; carbonic acid, 7 oz.

'The 9 oz. of lime may be obtained apart, by burning the chalk, as in a lime-kiln. The 9 oz. of burnt lime may be dissolved in any quantity of water not less than 40 gallons. The solution would be called lime-water. During the burning of the chalk to convert it into lime, the 7 oz. of carbonic acid are driven off. This acid when uncombined, is naturally volatile and mild; it is the same substance that forms what has been called soda-water, when dissolved in water under pressure.

'Now, so very sparingly soluble in water is chalk by itself, that probably upwards of 5000 gallons would be necessary to dissolve 1 lb. of 16 oz.; but by combining 1 lb. of chalk in water with 7 oz. additional of carbonic acid—that is to say, with as much more carbonic acid as the chalk itself contains—the chalk becomes readily soluble in water, and when so dissolved, is called bicarbonate of lime. If the quantity of water containing the 1 lb. of chalk with 7 oz. additional of carbonic acid, were 400 gallons, the solution would be a water of the same hardness as well-water from the chalk-strata, and not sensibly different in other respects.

'Thus it appears that 1 lb. of chalk, scarcely soluble at all in water, may be rendered soluble in it by either of two distinct chemical changes—soluble by being deprived entirely of its carbonic acid, when it forms lime-water, and soluble by combining with a second dose of carbonic acid, making up bicarbonate of lime.

'Now, if a solution of the 9 oz. of burnt lime, forming lime-water, and another solution of the 1 lb. of chalk and the 7 oz. of carbonic acid, forming bicarbonate of lime, be mixed together, they will so act upon each other as to restore the 2 lbs. of chalk, which will, after the mixture, subside, leaving a bright water above. This water will be free from bicarbonate of lime, free from burnt lime, and free from chalk, except a very little, which we keep out of account at present for the sake of simplicity in this explanation. The following table will shew what occurs when this mutual action takes place:

102

| AGENTS. | PRODUCTS. |
|--|--|
| Bicarbonate of lime
in 400 gallons. | Chalk . . . 16 oz. = 16 oz. of chalk
with
Carbonic acid 7 oz. }
= 16 oz. of chalk |
| Burnt lime in 40 gallons of lime-water | 9 oz. } |

A small residuum of the chalk always remains not separated by the process. Of 17½ grains, for instance, contained in a gallon of water, only 16 grains would be deposited, and 1½ grains would remain. In other words, water with 17½° of hardness, arising from chalk, can be reduced to 1½°, but not lower.

'These explanations will make it easy to comprehend the successive parts of the softening process.

'Supposing it was a moderate quantity of well-water from the chalk-strata around the metropolis that we had to soften, say 400 gallons. This quantity, as has already been explained, would contain 1 lb. of chalk, and would fill a vessel 4 feet square by 4 feet deep.

'We would take 9 oz. of burnt lime, made from soft upper chalk; we first slack it into a hydrate, by adding a little water. When this is done, we would put the slacked lime into the vessel where we intend to soften; then gradually add some of the water in order to form lime-water. For this purpose, at least 40 gallons are necessary, but we may add water gradually till we have added thrice as much as this; afterwards, we may add the water more freely, taking care to mix intimately the water and the lime-water, or lime. Or we might previously form saturated lime-water, which is very easy to form, and then make use of this lime-water instead of lime, putting in the lime-water first, and adding the water to be softened. The proportion in this case would be one bulk of lime-water to ten bulks of the hard water.'

It is of importance that the lime-water—that is, the softening ingredient—be put into the vessel first, and the hard water gradually added, because there is thus an excess of lime present up to the very close of the process. Instead of lime-water, the lime itself may be put at once into the vessel, and some of the water to be softened gradually added to dissolve it. The softened water thus obtained has no action on lead-pipes or cisterns, as many soft waters have. One ton of burned lime, used for softening, will produce three and a half tons of precipitate. The present water-supply of the metropolis, if subjected to Clark's process, would deposit about fifty tons of chalk daily.

The process was in operation on a large scale for several years (1854—1861) at Plumstead, near Woolwich, where 600,000 gallons daily were operated upon with the most satisfactory result. These works are now given up, though for reasons quite apart from any failure in the process. But several water-works have since been erected, or are in course of erection, by Mr Homeraham, C.E., London, for supplying water from the chalk springs softened by Clark's method; e.g. at Castle Howard, seat of the Earl of Carlisle (1858); at Caterham, Surrey, for the supply of Caterham, Waringham, and several neighbouring towns (1861); at Shooter's Hill, Kent, for the War Office, for softening the water of the Kent Company for the supply of the Herbert Hospital, &c. (1865); at all of which works the process is in successful operation. Mr Homeraham has also nearly completed works near Tring, Herts, for the supply of Tring, Aylesbury, and other towns, with softened spring-water. Mr Homeraham finds that spring-water from the chalk can readily, on

the large scale, be softened down to from 2½ to 4½ degrees of hardness.

Clark's process is not confined in its effects to softening; it has a decided influence as regards organic impurities; for it not only removes the active source of corruption which exists in all chalk-water, as above explained, but the precipitated chalk carries down with it a large proportion of such organic matters as may be already present. Several calico-printers in Lancashire have had Clark's process in use for several years, for the improvement of the quality of the water employed in their processes.

Natural Process of Purification from Organic Matter.—Although, by means of sand and other filters, or of the liming process, organic contamination of water may be much reduced, there still remains enough to render the water unsafe for use. Is water, then, once corrupted with organic matter, hopelessly and permanently so? This question can be answered in the negative. Filthy water has a tendency to purify itself, and this in two ways. In the first place, in any shallow stream of polluted water, such as the kennels of a street, there may be observed long brushes of a sort of slimy vegetation adhering to every projection of the bottom. All this matter has been disengaged from the water, which thus flows away so much the purer. The second and most effective part of the natural purification consists in the actual decomposition of the impurities. The nitrogen of the decaying matter, then, goes to form nitric acid, which, uniting with bases, forms salts of the class called *nitrates*, of which saltpetre is one. Thus, what was in a state of putrefactive change, offensive to the senses, breeding loathsome insects, and causing dangerous disorders, is changed in course of time into a stable and harmless product. This process is constantly going on in rivers and other waters containing organic matter. In the case of streams passing through populous districts, the contamination goes on at a rate far beyond the power of natural purification; but we can easily conceive how a river, very much contaminated with organic impurities at one part of its course, may, after flowing a long way through an uninhabited tract, be almost restored to its natural state. The process is one of oxidation, and takes place at the expense of the free oxygen, of which, in healthy normal water, there ought to be 29 per cent. of the entire volume of gases held in solution.

The oxidation is much favoured and hastened when the water percolates or filters very slowly through porous beds of earth. If the filtration has been sufficiently prolonged to convert all the decaying matter into carbonic acid or nitrates, the water will be pure, as far as the organic taint and the presence of animalcules are concerned, and will, in fact, be neither disagreeable nor unwholesome, the amount of the dissolved carbonates or nitrates being unimportant.

Dr Smith has proved by direct experiment that decomposing organic matter passed through a filtering-bed is changed into nitric acid. 'A jar, open at both ends, such as is used with an air-pump, was filled with sand, and some putrid yeast, which contained no nitric acid, was mixed with pure water, and poured on the sand, and allowed to filter through. The production of nitric acid was abundant.' It is not improbable that other earthy matters, such as loam and clay, may have a still more decided influence in hastening the formation of the nitrates; and perhaps by imitating more closely the slow mode of filtration by which nature converts surface-water into spring-water, it may yet be practicable to make the most contaminated waters fit for use.

Conveyance, Storage, and Distribution.

Into the engineering operations connected with the conveyance of water from its source to the town to be supplied, we need not enter, beyond noticing, that when the source is below the level of the houses, steam or other power is necessary to lift or propel the water to the necessary height; while in the more general and more desirable case of the source being higher than the place where the supply is to be delivered, the water is made to flow by its own gravitation, either in a channel or culvert with a continuous descent, as in the ancient Aqueduct (q. v.), or in the simpler and more economical modern plan of a line of cast-iron pipes following the inequalities of the surface. The annexed diagram represents an outline of this mode of conveyance; where *a* is a lake

Fig. 1.

or reservoir situated in a mountainous district, and *b* a town separated by several miles of irregular country; the course of the pipes is indicated by the dotted line, and the pressure of the water at *a* suffices to make the water rise at *b* to a height nearly equal to that of the head. In many cases, both principles are employed, the water flowing for the most part in a gently sloping conduit, tunnelled through hills where necessary, and being carried through valleys in tubes descending and ascending—an inverted siphon, as it is called. The Croton Aqueduct, which supplies New York, is carried across the Manhattan Valley, upwards of 100 feet deep, in this way. The Glasgow supply from Loch Katrine flows mainly in a sloping channel carried through tunnels and over bridges; but there are four miles of iron pipings across valleys.

The extent of the storage in reservoirs depends on the nature of the supply. If water is derived from perennial springs, whose minimum flow equals the maximum demand, the storage may be the least possible. If a river is the source, the reservoirs should be large enough to hold such a stock as will carry the consumers over the periods when the river is polluted by rains; they should also be large, on the principle of allowing time for purification by subsidence, especially if artificial filtration is not employed. In places where the supply is obtained from surface-drainage, or from a small stream, the practice is to build reservoirs capable of containing a five or six months' supply, it being necessary to provide against the greatest droughts that ever happen in any season.

The reservoirs should be deep, so as to prevent vegetation; and the distributing or service reservoirs should be roofed.

In distributing water over a town, two different methods have been adopted, known respectively as the *intermittent* and the *constant* systems of supply. On the intermittent system, water is laid on once a day, or once in two or three days, as the case may be, and fills a tank attached to every separate house, and from this tank the water is drawn off as required. The feeding-pipe of such a tank or cistern is provided with a ball-cock (see fig. 2), which ingeniously shuts off or admits the supply, as the cistern may be full or empty. On the constant system, no tank is absolutely needed, but the house-pipes are kept constantly charged through their unbroken connection with the distributing reservoir, which must

therefore be higher than the highest house to be served. The intermittent supply was until lately employed everywhere in the metropolis; but it is universally admitted that the other system is

Fig. 2

vastly superior in every respect. The disadvantages of the intermittent practice have been strongly set forth in all the recent official Reports on sanitary improvement: the expense of the erection and repair of cisterns, the trouble requisite to keep them clean, the contamination of the water by the neighbourhood of sources of pollution, the frequent waste of water that occurs, the difficulties imposed on the poorer class of tenements where cisterns are not provided—are a few of the objections urged against this mode of supply. In a letter in the *Times*, 3d January 1866, Dr H. Jeaffreson thus describes the condition, in regard to water-supply, of the centres of typhus infection in Lambeth, Southwark, Bethnal-green, &c. 'Those houses the best supplied have each a butt, holding about 80 gallons, into which water flows from a stand-pipe for from ten minutes to half an hour each day, and is supposed to supply the wants of 20 persons for cooking, the washing of their persons, house, and linen, and for the rinsing down of the w.-c. at such times as it may suit the caprice of any one of the inmates. At other places, a larger butt, but in relation to the number of persons proportionally smaller, supplies a whole court of ten or more three-roomed houses, which have no back-yards, and a population of 150 people—members of 30 different families. On Sundays, even this supply is absent, the water of the day before is gone, and in many houses, that for the Sunday cooking has to be begged from neighbours who may have provided themselves with a larger butt, who are more provident or more dirty. More than nine-tenths of these water-butts have no covers; and fully half are so placed as to catch the drippings from the foul eaves of the houses, and are lined internally with scum and slimy vegetation.'

One important advantage, arising from the constant system, is the ease with which water can be had in time of fire. The water being supplied at high-pressure, all that is necessary is to affix a hose to the water-plug in the street, when a jet corresponding in height to the pressure is obtained, which can be immediately directed against the fire.

The ratio of the supply to the population varies in different towns. In Edinburgh, it is 34 gallons for each individual; in Glasgow, it is 45 gallons. This includes the water furnished to works of various kinds. The eight companies that supply London pour into the city and suburbs not much less than 100,000,000 gallons daily, which gives 206 gallons per house (including manufactories), or 26 gallons to each person. Notwithstanding this, owing to the neglect of the proprietors, 'thousands of the poor get but little of it directly any day, and none at all on Sundays.'

Cisterns, Pipes.—Owing to the action of water on lead, already described, it is desirable to avoid the use of that metal in connection with very soft lake or river water. With regard to lead pipes, if the precaution is taken when the water has stood for any time in them, of allowing the first portions to run off before any is taken for use, little danger can arise; but either lead cisterns should be wholly avoided, or

means taken to ascertain whether they contaminate the water; and if so, a remedy should be applied. There are various substitutes for lead as a lining for cisterns. Slate slabs are highly recommended. Gutta-percha is also found to be an easily fitted, cheap, and durable lining. For a few days, the water tastes of the naphtha used in applying the lining; but afterwards, no kind of water, not even acids, have any action on the gutta-percha. Pipes of gutta-percha may also be used; they are cheap, and easily fitted up.

Common Wells.—The simplest of all water-supplies is that of a cottage or farmhouse in the country, with a good spring rising to the surface close by; and yet what a poor use is usually made of such a precious boon! The country wall is generally a simple cavity to receive the spring, rudely lined, it may be, with stones, but with open mouth, into which dust and dead leaves are blown by every wind, and foul surface-water is trickling from all sides. Being exposed to the light, there is generally a profuse vegetation on the bottom and sides, and, in addition to these impurities, it is further muddied by the dipping in of buckets, often dirty on the outside. Who has not been disgusted, when asking a drink at a cottage, to get water thick with dust and visible impurities, knowing, at the same time, that it might be so easily remedied? A surface-spring should always be covered, and made to issue by a pipe; half a day's labour to create a fall, and a clay drain-tube, will generally convert a filthy puddle into a crystal fount. It is singular to see this blindness to the impurity of water in people otherwise cleanly enough. This is a subject worth the attention of country physicians and clergymen. The evil effects of drinking impure water are not confined to towns. May not the putrid sore throat and malignant fevers that often sweep away whole households in the country, especially in autumn, be partly owing to the cause now pointed at?

Deep wells should invariably be covered, and carefully protected from the infiltration of superficial ooze. The situation of pump-wells is often singularly ill chosen in this respect. See ARTESIAN WELLS.

WATER-TABLE, a set-off in a wall sloped on top to throw off the rain.

WATERTOWN, capital of Jefferson County, New York, U. S., on the Black River, 86 miles north-west from Utica, and 182 from Albany; has manufactories of cotton, woollen, flour, paper, iron castings, machinery, &c. An ice-cave extends partly under the village. Pop. in 1860, 7572.

WATERTOWN, a city of Wisconsin, U. S., on Rock River, and the Fond du Lac and Rock River Railway, 40 miles east-by-north from Madison. The city is built on both sides of the Great Bend, where rapids with a fall of 24 feet afford water-power for flouring and saw mills, foundries, and manufactories of agricultural implements, furniture, woollen mills, and potteries. Settled in 1836. Pop. in 1860, 5302.

WATERVILLE, a village of Maine, U. S., on the right bank of the Kennebec River, at Ticonic Falls, 82 miles north-north-east from Portland. Around the falls are clustered saw-mills, plough, axe, hoe, and scythe factories, machine-shops, tanneries, &c. W. has a Baptist College, with 120 students, and library of 15,500 volumes, an academy, &c. Pop. in 1860, 4425.

WATER VIOLET. See HOTTONIA.

WATERY GRIPES is the popular name for a form of serous diarrhoea occurring in infants, in which there are copious discharges of thin watery motions, often limpid, or almost colourless, and

occasionally intermixed with flakes or shreds. This form of diarrhoea may be induced in weakly children by sudden impressions of cold on the surface, so as to check perspiration; or it may be brought on by cold drinks taken when the body is heated. The exhaustion brought about by the copious excretions from the bowels is sometimes so great that the case might be mistaken for one of cholera. On the occurrence of such an attack, the child should at once be wrapped up in warm flannel, placed in bed, with a bag of hot dry bran over the belly; and some arrowroot, with a little brandy, given frequently in teaspoonfuls or larger doses according to age; and the medical attendant should be at once sent for. If medical aid cannot be readily procured, opium must be carefully used to check the profuse evacuations. One of the best preparations is Aromatic Powder of Chalk and Opium, every 40 grains of which contain 1 grain of opium. From 3 to 5 grains of this powder, with a quarter of a grain of ipecacuanha, may be given, and repeated every three or four hours for two or three times, unless any head-symptoms (due to the opium) are perceived.

WATFORD, a market-town in the county of Hertford, on the banks of the Colne, 18 miles north-west of London. Straw-plait is manufactured, and silk-spinning and malting, and a trade in corn and live-stock, are carried on. Pop. 7418.

WATLING ISLAND, one of the Bahamas (q. v.).

WATT, JAMES, mechanic, engineer, and man of science, famous as the improver, and almost the inventor of the steam-engine, was born at Greenock in Scotland on the 19th of January 1736. His father was a blockmaker and general merchant at Greenock, was long a member of the council of that burgh, and for a time a magistrate. Two members of James W.'s family—his grandfather and his uncle—had had some local reputation for scientific or engineering ability. The former was a teacher of mathematics, surveying, and navigation at Crawfordsdyke, near Greenock; the latter practised as a land-surveyor and engineer with great success at Ayr. The grandfather, Thomas Watt, had been brought early in life to Lanarkshire from the neighbourhood of Aberdeen, where his family had previously lived. The father of Thomas Watt, the great-grandfather of James, is said to have farmed a little property of his own in Aberdeenshire, and to have been killed while fighting on the side of the Covenanters against the Marquis of Montrose.

James W. was very weakly as a child, and being unable to go to school with regularity, he became, to a great extent, his own instructor. What schooling he did get, he got in the schools of his native town. He early manifested a turn for mathematics and calculations, and a great interest in machines, and accordingly—his father's business, for which he had been destined, having greatly declined—he was, at the age of 13, sent to London, to learn the trade of a mathematical instrument maker. Ill-health compelled him to return home about a year after; but he had made good use of his opportunities in London; and on his health improving, he resolved to set up as a mathematical instrument maker in Glasgow. The incorporation of hammermen of that city put difficulties in his way; but the authorities of the university took him by the hand, appointed him mathematical instrument maker to the university, and gave him the use of premises within their precincts. He occupied these premises from 1757 to 1763. They seem to have been badly situated for his business, for which, moreover, at that time there was but little room in Glasgow;

and W. during those years was scarcely able to make a living. In 1763, he got a place of business in the town, and after that, he did somewhat better; still, he had to eke out his income by making or mending fiddles (which he was able to do, though he had no ear for music), or doing any mechanical job which came in his way; and no work requiring ingenuity or the application of scientific knowledge seems to have come amiss to him. At length, in 1767, he fell upon a new and a more lucrative occupation. In that year, he was employed to make the surveys and prepare the estimates for a canal projected to unite the Forth and the Clyde. This work could not be carried out at the time, because it failed to obtain the sanction of parliament; but W. had now made a beginning as a civil engineer, and henceforth he got a good deal of employment in this capacity. He made surveys for various canals, for the improvement of the harbours of Ayr, Port-Glasgow, and Greenock, and for the deepening of the Forth, the Clyde, and other rivers. One of the tasks committed to him was to decide whether a projected canal between the Firth of Clyde and the Western Ocean should be made by way of Crinan or of Tarbert; and the last—also the greatest—undertaking of this kind on which he was employed was a survey for a canal between Fort-William and Inverness; a work which has since been executed on a greater scale by Telford. In his surveys, he made use of a new micrometer, and of a machine, also of his own invention, for drawing in perspective—the latter of which appears to have been for several years about this time one of his sources of income. The Reports which he drew up in the capacity of engineer are said to have been remarkable for perspicuity and accuracy.

Living in the college at Glasgow, in constant intercourse with the professors of the university, with access to books, and with much unemployed time on his hands—having, too, a great love of knowledge, and a lively interest in mechanical novelties, W. had been a diligent student of science, and experimenter in the application of science to the arts. As early as 1759, his attention had been directed to the capabilities of steam as a motive-force by Mr Robison (q. v.), afterwards Professor of Natural Philosophy in the university of Edinburgh, who was then a student in Glasgow. It had occurred to Mr Robison that steam-pressure might be used to propel wheeled-carriages; but it does not appear that either W. or he attempted to carry out this idea. In 1761 or 1762, however, W. made a series of experiments on the force of steam, using a Papin's Digester. These do not seem to have led to any results; and it was not till the winter of 1763—1764, that he began the investigations which ended in his improvement of the steam-engine. During that winter, a working model of the Newcomen engine, kept for the use of the natural philosophy class in the college, was sent to him to be put in repair. W. quickly found out what was wrong with the model, and easily put it into order. But in doing this, he became greatly impressed with the defects of the machine, and with the importance of getting rid of them. The Newcomen engine (see STEAM-ENGINE), was still but little used, and only for pumping water out of mines. It was a cumbersome machine, and it required so much fuel that the expense of working it had restricted, and must always have restricted its use. It was not a steam-engine at all. It was worked by means of the atmospheric pressure; steam being only used in producing, by its condensation, a vacuum in a cylinder, into which—the vacuum made—a piston was depressed by the pressure of the air. The steam issuing from a boiler was admitted into the

cylinder until it filled it, when the supply was cut off by a self-acting cock; and then the steam was condensed in the cylinder by means of a jet of water. The water so greatly cooled the cylinder that the greater part of the steam at each stroke of the piston was wasted in heating its walls; and on the other hand, much of the injected water was heated to the boiling-point, and gave off steam, which resisted the descent of the piston. W. found that about four-fifths of the steam, and consequently of the fuel, was wasted; and he saw that to make the machine work economically, two apparently incompatible conditions must be obtained—first, that the walls of the cylinder must constantly be of the same temperature as the steam which came in contact with them; and second, that the injected water must never be heated up to 100°, the boiling-point *in vacuo*. He now experimented upon the conducting power of various substances, and made trial of a cylinder made of wood steeped in oil; but with this cylinder, though it cooled less rapidly than a metallic one, there was still far too much waste of steam. Constantly, from the end of 1763, occupied with the subject of steam, he at length, early in 1765, hit upon the expedient which solved all his difficulties—the separate condenser, an air-exhausted vessel, into which the steam should be admitted from the cylinder and there condensed. The separate condenser at once prevented the loss of steam in the cylinder which had arisen in the process of condensation; and there was no difficulty in keeping it cool, so as to prevent the undue heating of the injection-water. He had now got a perfectly economical engine on Newcomen's principle, but he did not rest content with this—he resolved to make steam his motive-power. Closing the cylinder at both top and bottom, and connecting the piston with the beam, to which it was to communicate motion, by a piston-rod passing through a stuffing-box, he admitted the steam by suitable valves alternately above and below the piston, to push it downwards and upwards in turn; and this done, his invention was substantially complete. He had at last made a real steam-engine, capable of being worked with a comparatively small expenditure of fuel, and of yielding any desired amount of power. Comparing his invention with the atmospheric engine of Newcomen, it must be admitted that it is not without justice that the popular voice has awarded him the name of inventor of the steam-engine.

W., soon after perfecting his model, formed a partnership with Dr Roebuck, then of the Carron Iron Works, for the construction of engines on a scale adapted to practical uses; and a model was erected at Kinneil, near Borrowstounness, where Dr Roebuck then lived. But Roebuck got into difficulties; and nothing further was done until, in 1773, W. entered into a partnership with Matthew Boulton of Soho, near Birmingham, when, Roebuck's interest having been repurchased, the manufacture of the new engine was commenced at the Soho Iron Works. A patent for his invention had been taken by W. in 1769. He got from parliament a prolongation of his patent for 25 years in 1775.

The advantages of the new engine were in no long time found out by the proprietors of mines; and it soon superseded Newcomen's machine as a pumping-engine. W. afterwards made numerous improvements in its construction (for the most important of which see *STREAM-ENGINE*); and in conjunction with his partner Boulton, he immensely improved the quality of the workmanship employed in building engines and other machines. In the years 1781, 1782, 1784, 1785, he obtained patents for a series of inventions—among them, the sun and planet motion, the expansive principle, the double engine,

the parallel motion, and the smokeless furnace, of most of which the chief purpose was to make steam-pressure available for turning machinery in mills. The accomplishment of this—extending the application of the new power to the arts—was of scarcely inferior importance to the invention of the steam-engine itself. The first contrivance invented by W. for this purpose, was lost to him through the treachery of a mechanic, who had been employed in making the model, who sold it to a manufacturer named Prickards, who got a patent for it for himself. The application to the steam-engine of the governor (see *STREAM-ENGINE*) was W.'s crowning improvement. He made numerous inventions unconnected with the steam-engine, several of which he patented, but they are all of minor importance.

He retired from business in the year 1800, giving up to his two sons his interest in the extensive and prosperous business which Boulton had created at Soho. He died at Heathfield in Staffordshire, on the 25th August 1819, in his 84th year. W. was twice married: first in 1763, to his cousin, Miss Miller; and a second time shortly after his removal to Birmingham, to a Miss M'Gregor of Glasgow. He had a most extensive and accurate knowledge of the physical sciences, to several of which he made important contributions—and an almost unsurpassed fund of general information. (His claims to be considered the discoverer of the composition of water are considered in the article *WATER*.) He was elected a Fellow of the Royal Society of Edinburgh in 1784; a Fellow of the Royal Society of London in 1785; a corresponding member of the Batavian Society in 1787; and in 1808, a corresponding member, and afterwards a foreign member, of the Institute of France. The university of Glasgow conferred on him the degree of LL.D. in 1806. His statue, the funds for which had been raised by a public and almost a national subscription, was erected in Birmingham in 1824; and his statue is now to be seen in the streets of many of our larger towns. The honours paid to his memory and to himself in his later years appear to have been deserved by his personal qualities, no less than by the immeasurable benefits which his inventive talents have conferred upon the human race.

WATTEAU, ANTOINE, was born at Valenciennes, in the year 1684. In 1702, he betook himself to Paris, where for some time he worked as assistant to a scene-painter. When this employment failed him, by the retirement of his master from Paris, he employed himself in copying pictures. The talent which he shewed in this humble walk of the art, drew the attention of Gillet, a popular painter of the day, who engaged him to assist in his studio. In no long time, it was found that the pupil excelled his master, who speedily relinquished the field in his favour, and became an engraver. The success of W. was now assured; he was made a member of the French Academy, and became by special favour *Peintre de Fêtes Galantes du Roi*. In 1718, he visited England, it is believed chiefly on account of his health, and to consult a certain Dr Meade, then famous, for whom, during his stay, he painted one or two pictures. He remained about a year, without, as it should seem, much benefit. After his return home, his health gradually declined; and in 1721, he died at Nogent, near Paris.

In virtue of their charming colour and graceful design, the pictures of W. continue to please, though his reputation as an artist is now but a faint echo of that which, in his lifetime, he enjoyed. He employed himself chiefly in painting small landscapes, with something of the nature of the *Fête Galante* going on in them—idylls in court-dress,

which, as preserving for us the fopperies of the time, are not without a certain value distinct from their properly artistic one.

WATTLE. See ACACIA.

WATTLE-BIRD (*Anthochaera carunculata*), an Australian bird, of the family of Honey-eaters (*Meliphagidae*). It is about the size of a magpie, grayish brown above, each feather striped, and bordered with white; the tail brown, long, wide, and graduated. It derives its name from a pendulous reddish wattle on each side of the throat. It feeds chiefly on honey and insects extracted from the flowers of *Banksias*, these trees continuing in flower most of the year. It is a bold and active bird, and drives away all other birds from the part of the tree which it occupies.

WATTS, ISAAC, was born on July 17, 1674, at Southampton, where his father had a boarding-school. He was educated at the grammar-school of his native place, and afterwards sent, at the age of 16, to an academy in London, kept by Mr Thomas Rowe, an Independent minister. Here his devotion to his studies was so excessive as to permanently injure his constitution. In 1696, he became tutor in the family of Sir John Hartopp, at Stoke-Newington, with whom he remained six years. During the latter part of this time, he officiated as assistant to Dr Chauncey, minister of the Independent Church in Mark Lane, to whose post he succeeded in 1702. His health was throughout infirm; and in 1712, he was prostrated by an illness so violent that he never thoroughly recovered from its effects, though he lived for many years afterwards. A visit which he paid to Sir Thomas Abney, at Theobalds, for change of air, resulted in his domestication in the establishment till his death, 26 years afterwards, on November 25, 1748. As his health permitted, he continued to discharge his clerical duties, and to occupy himself with literary pursuits. His theological works were numerous, but are now quite forgotten. His treatise on *Logic*, though long since superseded, had in its day a considerable reputation, and was adopted as a text-book by the university of Oxford. By his well-known Hymns for children, his reputation has been chiefly perpetuated. So lately as 1837, his *Horæ Lyricæ* were republished, with a Memoir by Southey. In Johnson's *Lives of the Poets*, a notice of him is likewise to be found.

WAUKE'GAN, a city and port of Wisconsin, on the west shore of Lake Michigan, 35 miles north-by-west from Chicago, and 50 miles south of Milwaukee, connected with both by railway. The town is handsomely built on a bluff, 50 feet above the lake, and has 6 churches, 2 academies, steam flour-mills, and considerable commerce. Pop. about 4000.

WAVE, the name given to a *state of disturbance* propagated from one set of particles of a medium to the adjoining set, and so on; sometimes with, sometimes without, a small permanent displacement of these particles. But the essential characteristic is, that energy (see FORCE), not Matter (q. v.), is on the whole transferred. The theory of wave-motion is of the utmost importance in physical science; since, besides the tide-wave, waves in the sea, in ponds, or in canals, undulations in a stretched cord (such as a pianoforte wire), or in a solid (as sound-waves or earthquake-waves), we know that sounds in air are propagated as waves (see SOUND), and that even light (see UNDULATORY THEORY) is a form of wave-motion.

The general investigation of the form and rate of propagation of waves demands the application of

the highest resources of mathematics; and the theory of even such comparatively simple cases as the wind-waves in deep water (the Atlantic roll, for instance), though easily enough treated to a first, and even to a second and third approximation, has not yet been thoroughly worked out, as fluid friction has not been taken account of. In this article, therefore, we will merely *state* some of the more important conclusions which mathematical analysis has established in the more difficult of these inquiries, comparing them with the observations of Scott Russell and others; while we give at full length the very simple investigations of the motion of a wave along a stretched cord, and of the propagation of a particular kind of sound-wave.

To find the rate at which an undulation runs along a stretched cord, as, for instance, when a harp-string is sharply struck or plucked near one end, a very simple investigation suffices. Suppose a uniform cord to be stretched with a given tension in a smooth tube of any form whatever, we may easily shew that there is a certain velocity with which the cord must be drawn through the tube in order to *cease to press on it at any point*, that is, to move independently of the tube altogether. For the pressure on the tube is due to the tension of the cord; and is relieved by the so-called Centrifugal Force (see CENTRAL FORCES) when the cord is in motion.

If T be the tension of the cord, r the radius of curvature of the tube at any point, the pressure on the tube per unit of length is

$$\frac{T}{r}$$

If m be the mass of unit length of the cord, v its velocity, the centrifugal force is

$$\frac{mv^2}{r}$$

These are equal in magnitude, and so destroy each other, if

$$T = mv^2.$$

Hence, if the cord be pulled through the tube with the velocity thus determined, there will be no pressure on the tube, and it may therefore be dispensed with. If we suppose the tube to have a form such as that in the figure, where the extreme portions

Fig. 1.

are in one straight line, the cord will appear to be drawn with velocity v , along this, the curved part being occupied by each portion of the cord in succession: presenting something like the appearance of a row of sheep, in Indian file, jumping over a hedge.

To a spectator moving in the direction of the arrow with velocity v , the straight parts of the cord will appear to be at rest, while an undulation of any definite form and size whatever runs along it with velocity v , in the opposite direction. This is a very singular case, and illustrates in a very clear manner the possibility of the propagation of a *solitary wave*.

Thus we have proved that the velocity with which an undulation runs along such a cord is

$$\sqrt{\frac{T}{m}}$$

If l be the length of the cord in feet, w its whole

weight, W the appended weight by which it is stretched, $g = 32.2$ feet, the measure of the earth's gravity, this becomes

$$\sqrt{\frac{W}{wl}g}$$

This formula is found to agree almost exactly with the results of experiment. We can easily see why it should be to some small extent incorrect, because we have supposed the cord to be inextensible, and perfectly flexible, which it cannot be; and we have neglected the effects of extraneous forces, such as gravity, the resistance of the air, &c.

Let us next consider the motion of air in a cylindrical tube, in the particular case in which the leg of a vibrating tuning-fork is applied at one end. This is a simple case of the propagation of sound-waves. We shall treat it by a synthetical process, somewhat like that given by Newton.

As we have already seen (see PENDULUM), a simple vibration such as that of a pendulum or tuning-fork is the resolved part, in a definite line, of the uniform motion of a point in the circumference of a circle. What we have now to shew is, that such a motion of all the particles of air in the pipe, the *phase* of the vibration (or the position of the particle in its path at any instant) depending on its distance from the end of the tube, is consistent with mechanical principles. When this is done, it will be easy for us to trace, in this particular example, the process by which the wave is propagated from one layer of the fluid to the next. We must now consider (a little more closely than in PENDULUM or SOUND) the nature of the simple vibration of each particle of the air.

Suppose P to move, with uniform velocity V , in the circle APB , and let PQ be drawn perpendicular to the fixed diameter, OA . Then the acceleration of P 's motion is $\frac{V^2}{OA}$ in the direction PO . Hence in the motion of Q , which is a simple vibration, we have, by the rule for resolving velocities and accelerations (see VELOCITY),

$$\text{Velocity of } Q = \frac{PQ}{OA} V \text{ in the direction } QO;$$

$$\text{Acceleration of } Q = \frac{OQ}{OA} \frac{V^2}{OA} \text{ in the direction } QO.$$

Next consider two particles of air near one another in the axis of the tube, or the masses of air in two contiguous cross-sections of the tube. If the phase of vibration were the same for both, they would be *equally* displaced from their original positions, and the air between them would be neither compressed nor dilated. Hence, that a wave may pass, the phases must be different. Let, then, Q represent the position of the one particle, or layer, in its line of vibration at any instant; Q' , the simultaneous position of the other.

Fig. 2.

The first will be displaced through a space OQ from its position of rest; the second, through a space OQ' ; and their distance will therefore be altered by the amount QQ' , which may be taken to represent the compression or dilatation. But it is easy to see that, as P and P' move round, QQ' is always proportional to PQ . Hence the compression or dilatation of the air in any cross-section of the tube is proportional to the

velocity with which it is moving. Hence the difference of pressures before and behind any such section is proportional to the difference of velocities—i. e., to the acceleration of the motion while the section passes over a space equal to its own thickness. And this is consistent with mechanical principles, for the *mass* of air in the section is constant, while the difference of pressures before and behind produces the acceleration, and should therefore be proportional to it. The particles of air in cross-sections of the tube therefore vibrate, each in the same period as does the tuning-fork, but the phase is *later* for each section in proportion to its distance from the fork. Where the phase is one or more whole vibrations later than that of the fork, the motion is exactly the same as that of the fork, and *simultaneous* with it. At all other points, it is the same as that of the fork, but not simultaneous. Thus, the greatest displacement of the fork is immediately shared by the layer next it, later by the next layer, and so on. Thus, a *wave* of displacement travels along the tube from one section to the next, while each particle merely oscillates backward and forward through (in general) a very small space about its position of rest.

The reader who has followed the little geometrical investigation above will have no difficulty in proving for himself that the velocity with which the wave travels is proportional to

$$\sqrt{\frac{p}{\rho}}$$

where p is the pressure, and ρ the density of the air. The easiest mode of doing this is to express, in terms of these and other quantities, the equation given us by the laws of motion,

$$\text{Mass} \times \text{Acceleration} = \text{Difference of pressures,}$$

and to assume that Hooke's (q. v.) Law holds, even during the *sudden* compression of air. This, we know, is not the case; so that a correction has to be applied to the above expression, depending on the heat developed by sudden compression or lost in sudden rarefaction, by each of which the elastic force of the air is *increased*. But this has been already discussed in SOUND.

The above formula shews us, however, that the velocity of sound is not affected by the pressure of the air—i. e., the height of the barometer—since, in still air, p is *proportional* to ρ . The velocity does depend on the temperature, being, in fact, proportional (*ceteris paribus*) to the square root of the temperature measured from absolute zero. See HEAT.

We see also from the formula that the velocity is inversely as the square root of the density of the gas—the pressure being the same. Thus, a sound-wave travels about four times faster in hydrogen than in air.

Also we see that, within the limits of approximation we have used, the velocity does not depend upon the intensity, pitch, or quality of the Sound (q. v.). The investigations which seem to lead to slight modifications of this conclusion are too recondite to be introduced here. We can only mention, also, the beautiful investigations of Stokes (q. v.) connected with the extinction of a sound-wave as it proceeds, partly by fluid friction, partly by radiation. And we may conclude by stating that the result of a completely general investigation of the velocity of a sound-wave gives, to a first approximation, the result we have deduced from the study of a simple particular case.

We now come to the consideration of waves in water. Of these, there are several species. One, however, we may merely mention, as its theory is

WAVE.

the same as that just briefly discussed. This is a sound-wave, or *wave of compression*, in water. Its velocity is considerably greater than that of sound in air (see SOUND). The others, which are commonly observed on the surface of water, depend on mere changes of level, and their effects; and in studying them, we may consider water as incompressible.

The first of these is what is called a *long* or *solitary* wave. Its essential characteristic is, that its length is great compared with the depth of the liquid in which it moves. To this class belong the tide-wave (see TIDES), and the long wave which accompanies a canal-boat, and which we see slowly traversing the canal when the boat is stopped. Scott Russell has made many interesting observations on this wave, all of which accord well with the results of the mathematical theory of its propagation. The velocity of this wave depends solely on the depth, not on the density of the liquid in which it moves—and in a uniform canal the velocity is that which would be acquired by a stone falling freely through a space equal to half the depth of the water. Another characteristic of this wave is that, after it has passed, it leaves the water bodily transferred through a small space along the bed of the canal—forwards or backwards, according as it consists of an elevation or a depression of the water-surface. Scott Russell has shewn that the most favourable rate at which a canal-boat can be drawn is when its velocity is such that it rides on the crest of the solitary wave. If drawn at any other speed, it leaves the solitary wave behind, or is left by it; and in either case, part of the horse's work is expended in producing fresh solitary waves. An excellent mode of observing these waves is to tilt slightly a rectangular box containing some water, and restore it to its original position. A long wave is thus formed, which is reflected repeatedly at the ends of the box, and whose rate of motion may be accurately observed by watching the image of a candle reflected at the surface of the water. If the sides of the box be made of glass, and some light particles be dispersed through the water, their motions enable us to discover all the circumstances of the propagation of this wave.

We next come to what are called *oscillatory* waves in water or other liquids. To this class belong all waves whose length from crest to crest is small compared with the depth of the liquid; from ripples on a pool to the long roll of the Atlantic. They are never observed as solitary waves, their general characteristic being their periodical recurrence. And, by watching a piece of cork floating on the surface, we see that it moves forwards when at the crest of the wave, and backwards through an equal amount when in the trough. Also it rises while passing from trough to crest, and sinks from crest to trough. Mathematical investigation, confirmed by experiments with floats at sea, and with short waves in the glazed box before described, shews that each particle of the water describes a *circle* about its position of rest in the vertical plane in which the wave is advancing. Particles at greater and greater depths describe smaller and smaller circles. The diameters of these circles diminish with extreme rapidity. At a depth equal to the distance from crest to crest (i. e., the length of the wave), the displacement of the water is already only $\frac{1}{11}$ th of that at the surface. At the depth of two wave-lengths, it is about $\frac{1}{100}$ th of that at the surface. Thus we may see to how small a depth the ocean is agitated even by the most tremendous wind-waves; for, according to Scoresby, 43 feet is about the utmost difference of level between crest and trough in ocean-waves. If

the wave-length be 300 feet (which is a large estimate), then at a depth of 300 feet the water-particles describe circles whose radii are only the $\frac{1}{11}$ th of a foot, or about four-tenths of an inch; and at 600 feet this is reduced to $\frac{1}{100}$ th of an inch; while the depth of the Atlantic is in many parts more than three or four miles. In this case, the velocity of propagation of the wave has been shewn to be

$$\sqrt{\frac{gl}{2\pi}}$$

where g is, as before, 32.2 feet; l is the wave-length in feet; and π is the ratio of the circumference of a circle to its diameter (see QUADRATURE OF THE CIRCLE). Thus, the velocity of an oscillatory wave in deep water is proportional to the square root of its length. This fact has been of use as an analogy in helping us to account for the *Dispersion* (see REFRACTION) of Light, where, by experiment, we know that the waves of red light are longer than those of blue light, and also that they travel faster in refracting media.

When the depth is not infinitely great compared with the length of a wave, theory and experiment agree in shewing that the motion of each particle takes place in an ellipse whose major axis is horizontal. These ellipses diminish rapidly in length as we descend in the liquid, but still more rapidly in breadth; so that, as was to be expected, the particles at the bottom oscillate in horizontal straight lines. The expression for the velocity of propagation is now by no means so simple as in the previous cases—but is easily shewn to include the values already given.

So far, the first approximation. A section of the surface made by a vertical plane in the direction of the wave's motion, is shewn to be bounded by the *Harmonic Curve*, or *Curve of Sines*, the form assumed by a vibrating string (see SOUND); from which it follows that the crests are similar to the troughs. The second approximation makes the troughs flatter, and the crests steeper, and also shews that the particles are, on the whole, carried *forward* by each successive wave. The amount of this progression diminishes rapidly with the depth below the surface. A third approximation shews that the velocity is, *ceteris paribus*, greater the greater is the height of the waves.

When waves advance towards the shore, their circumstances change, in general gradually, from those of oscillatory waves to those of waves of translation, as the depth of the water becomes less and less considerable in comparison with the length of the wave; and it is found by experiment that they 'break,' as it is called, when the depth of the water is about equal to the height of the crest above the undisturbed level. All the curious phenomena of breakers are thus easily explained by the results we have already given, when they are considered with reference to the gradual alteration of the depth of the water.

Finally, we must notice a singular phenomenon often observed, viz., that of a series of waves breaking on the coast, every eighth, or ninth, or tenth, &c. is seen to be higher than its predecessors or successors. The explanation is simple enough, and points to the simultaneous existence of two or more sets of oscillatory waves of different lengths, due in general to quite distinct causes, which reach the shore together.—For further information on this subject the reader is referred to papers by Stokes in the *Cambridge and Dublin Math. Journal*, vol. iv., and the *Cambridge Phil. Trans.*, vol. viii., and to Airy's 'Tides and Waves' in the *Encyclopædia Metrop.*

This might lead us to consider the very interesting

case of 'Co-existence of Small Motions' presented by the Interference (q. v.) of such waves; but we have already in various articles (see POLARIZATION, SOUND, UNDULATORY THEORY) given sufficient examples to illustrate the great principle.

There remains the consideration of the propagation of waves in elastic solids, among which, at least so far as luminiferous vibrations are concerned, it appears that the Ether (q. v.) must be ranked. This is a subject of a higher order of difficulty than any of those before mentioned, and, in the case of light at least, has not yet been treated in a thoroughly satisfactory manner, though such men as Cauchy, Neumann, Macculagh, Green, and Stokes have written profound memoirs upon it.

WAVRE, a town in the province of South Brabant, Belgium, 15 miles south-east of Brussels, has a pop. of 5241, who are mostly engaged in the manufacture of hats, leather, and cotton-yarn. W. is better known as the scene of a desperate and protracted conflict between the French and Prussians, on the 18—19th June 1815. The former, under Grouchy, Gerard, and Vandamme, advanced against the Prussians at the same time as Napoleon directed the troops under his immediate orders against Wellington at Waterloo (q. v.), and being much superior in number (32,000 to 15,200), drove the Prussians, under Thielman, into W., where they defended themselves with desperate firmness, repulsing thirteen different assaults in the course of the 18th. On the following morning, Thielman, who, had heard of the victory at Waterloo, attacked Grouchy, but was repulsed with vigour, though the urgent orders of Napoleon forced the latter to retreat to Laon, instead of following up his success.

WAX. Under this term, chemists include various matters of a well-known (so-called *waxy*) appearance, derived both from the animal and the vegetable kingdoms. While in their general relations they approximate to the Fats, they differ materially from the latter in their chemical composition; those of them which have been carefully examined, being found to consist partly of mixtures of alcohols and compound ethers, and partly of free fatty acids. Their general properties may be thus laid down: They are solid or semi-solid matters; are easily broken when cold, but at a moderate warmth are soft and pliable, and fuse at a temperature below 212°. They have a peculiar glistening appearance, are lighter than water, are insoluble in that fluid and in cold alcohol, but dissolve readily in ether; they are combustible, and burn with an illuminating flame, are non-volatile, and when heated in a free atmosphere, undergo decomposition. In this category are included spermaceti (which has been already considered), bees' wax, Chinese wax, and other less known kinds, as palm or vegetable wax (obtained from the bark of *Ceraxylon andicola*, by the action of hot water and pressure), Carnahuba wax (an exudation from the leaves of a Brazilian palm), sugar-cane wax, &c.

Bees' wax is an animal secretion formed by the bees from sugar, and constitutes the material of which the cells of the honey-comb are composed. It is obtained by expressing the honey, and fusing the residue in boiling-water. In this state it is of a yellow colour (*Cera Flava*). It may be bleached, so as to form white wax (*Cera Alba*), by being exposed in thin slices to the action of solar light, or by the action of nitric acid. (Chlorine readily destroys the colour, but renders the wax unfit for candle-making, as a portion of the hydrogen of the wax is replaced by chlorine, and the candles, when burning, evolve irritating vapours of hydrochloric acid gas.) From the researches of Sir B. Brodie (*Phil. Trans.*, 1848, 1849),

it appears that wax consists of three different substances, *myricin*, *cerin*, and *cerolein*, which are separable from one another by means of alcohol. *Myricin*, which is insoluble in boiling alcohol, constitutes more than two-thirds of the bulk of ordinary wax. *Cerin*, or *cerotic acid*, which dissolves in boiling alcohol, but separates on cooling, varies in quantity in different specimens. In one sample of genuine bees' wax, Brodie found that it constituted 22 per cent, and it was always present in European samples, while in Ceylon wax it was entirely absent. This curious variation in the nature of an animal secretion, under different conditions of life, resembles the variations sometimes noticed in the acids of butter, in which the butyric and caproic acids of one season are replaced in another by vaccinic acid, differing from the former acids in the amount of oxygen alone. *Cerolein*, the substance soluble in cold alcohol, is a greasy body, constituting 4 or 5 per cent. of ordinary wax. Without entering into chemical details, we may observe that bees' wax yields the following derivatives: Carotic acid or cerin, $\text{HO}, \text{C}_{24}, \text{H}_{40}, \text{O}_2$; cerylic alcohol or cerolin, $\text{HO}, \text{C}_{24}, \text{H}_{40}, \text{O}$; melissylic alcohol or melissin, $\text{HO}, \text{C}_{26}, \text{H}_{42}, \text{O}$; melissic acid, $\text{HO}, \text{C}_{26}, \text{H}_{42}, \text{O}_2$; palmitic acid, $\text{HO}, \text{C}_{16}, \text{H}_{32}, \text{O}_2$; myricin, $\text{C}_{10}, \text{H}_{18}, \text{O}_4$; and melene, $\text{C}_{10}, \text{H}_{18}, \text{O}_4$.

Chinese Wax ($\text{C}_{128}, \text{H}_{208}, \text{O}_4$) is supposed to be the produce of a species of insect of the *Coccus* family, and consists principally of cerotic acid, in combination with oxide of cerotyl.

Both yellow and white bees' wax occur in the Pharmacopoeia. The characters and tests, as given in that work, are—*Of yellow wax*: 'Firm, breaking with a granular fracture, yellow, having an agreeable honey-like odour; not unctuous to the touch, does not melt under 140°, yields nothing to cold rectified spirit, but is entirely soluble in oil of turpentine; boiling-water in which it has been agitated, when cooled is not rendered blue by iodine.' *Of white wax*: 'Hard, nearly white, translucent; not unctuous to the touch, does not melt under 150°.' The iodine test is used because wax is often adulterated with starch. Wax was formerly much employed internally as an emollient medicine, in cases of suspected ulceration of the intestines. At present, it is only used as an external agent, being an ingredient of many ointments and plasters.

The commercial value of bees' wax is very great; and if it were possible to ascertain the total of the quantity produced, it would cause great surprise at the amount of valuable material derived from a source apparently so insufficient. Its chief uses are for candles, modelling, medicinal cerates or ointments, besides many minor purposes. Nearly 300 tons are annually imported into Great Britain, the value of which is about £50,000; but so large is the quantity consumed in the ceremonies of the Greek and Roman churches, that Russia alone consumes more than four times that amount, and the various Catholic countries probably ten times as much. The INSECT WAX of China, or Pe-la, has lately been imported in small quantities, and used in the manufacture of candles by Messrs Price & Co.; but it is far too costly for general use (see WAX INSECT). In China, this wax is very highly valued, and is so costly as to be used only by the highest classes; it is white, and breaks with a crystalline fracture and pearly lustre. *Of Vegetable Wax*, there are four distinct kinds known in commerce. The first in importance is the JAPAN WAX, which is almost as white and compact as refined bees' wax, which it closely resembles; it was first brought to Great Britain in 1859, and since then, some very considerable importations have taken place. It is said to be obtained by boiling the seeds of a species of *Rhus* (*R. succedanea*). It

has only been used in making candles. **BRAZILIAN VEGETABLE WAX** is also an article of regular importation, but only in small quantities; it is obtained from the leaves of *Corypha cerifera*, the Carnahuba Palm of the Brazilians. It forms a glossy varnish-like covering; and when the leaves are gathered, and begin to shrink from withering, it cracks and peels off, and is collected and melted into masses. It is hard and brittle, and of a dull yellow colour. The candlemakers have used it for mixing and improving other materials. In Brazil, candles are wholly made of it, or half the quantity of stearine is added. The **VEGETABLE WAX** of the Andes is also yielded by a palm (see **WAX PALM**). Although much used in Mexico, it has not yet become of commercial importance to Europe. It is chiefly used for candles in the churches. **MYRTLE WAX**, though rarely seen in Europe, is much used in the British colonies of North America, and the United States, and at the Cape of Good Hope; it is also in use in Brazil. It is procured by boiling the berries of *Myrica cerifera* in North America, and probably from other species in Brazil, and at the Cape of Good Hope. It resembles bees' wax very much, except that it has a greenish-yellow instead of a yellow colour. It is only used for candle-making. See **CANDLEBERRY**.

Of the manufactured compounds called wax, the following are the chief—viz., **SEALING-WAX** (q. v.). **MODELLERS' WAX**, used by artists for modelling small works. It consists of equal parts of bees' wax, druggists' lead-plaster—olive oil and yellow resin, and just sufficient whiting added to produce the consistency of putty. **GILDERS' WAX** consists of four parts of bees' wax, well mixed by melting with one part each of verdigris and sulphate of copper.

The bees' wax of commerce is of a dirty yellow colour, and mixed with many impurities. It has, consequently, to undergo a process of bleaching, by which it is rendered quite white and pure. The usual process is to melt the wax with boiling-water, and stir them together for a short time, so as to separate the impurities from the wax. It is then allowed to rest for a short time, and the pure wax floats on the top; and when cold, is taken off in a cake, the lower part of which is often discoloured with the dirty water. This is scraped off, and mixed with the next lot to be operated upon. The purified portion is next remelted, and is then allowed to trickle from the melting-pan on to a wooden cylinder, revolving rapidly, and partly immersed in pure cold water, in a large cistern. This throws it into the water in the form of fine thin feather-like flakes, which cool and harden instantly in the water. When all is run off, the wax is removed from the water, and laid on linen cloths, placed on tables in a field for the air to bleach. From time to time, the flakes are turned over and examined; and when the bleaching effect of the air seems to have stopped, the wax is remelted, and converted into flakes in the cistern, and replaced in the bleaching-ground until it is quite white. Chemical processes are sometimes resorted to, but they have not superseded the oldest, and, as yet, the best method, just described.

WAX, MINERAL, is a natural product, found in small quantities oozing from rocks of the coal formation. It is called **Ozokerite** by mineralogists, and has been found in such quantities, in one or two wells in the neighbourhood of Edinburgh, as to lead to the hope that it might have some practical use. It is of a dark-brown, almost black colour, in large lumps, of the consistency and lustre of hard wax. Candles have been made of it, but rather for curiosity than for use.

WAX-CLOTH, a name sometimes given, but very erroneously, to **FLOOR-CLOTH** (q. v.).

WAX-FLOWERS. An elegant use is found for bees' wax in the manufacture of wax-flowers. The wax for this purpose is bleached and prepared in thin sheets of various colours, which are cut out into the shapes for petals and leaves, according to the kind of flower to be imitated. They are easily made to adhere, either by a slight amount of heat, or a little melted wax.

WAX INSECT (*Coccus sinensis*; see **COCOUS**), a very small white insect, a native of China, of the same genus with the Cochineal and Kermes insects, and with the Scale insects, which are the pest of our greenhouses, valuable on account of the wax which it produces. It is found about the beginning of June on the branches of certain trees, on the juices of which it feeds, particularly on those of a kind of Sumach (*Rhus succedaneum*). The wax is deposited on the branches as a coating which resembles hoar-frost. This is scraped off towards the end of August, melted in boiling-water, and strained through a cloth. See **WAX**. The Chinese **W. I.** has been introduced by the French into Algeria.—Another **W. I.** is found in South America, but is not yet well known, nor has its wax become an article of commerce.

WAX MYRTLE. See **CANDLEBERRY**.

WAX-PAINTING is an art of great importance, better known, however, under the name of **Encaustic Painting** (q. v.).

WAX PALM (*Ceroxylon*—or *Iriartea*—*andicola*), a lofty palm, found in the Andes, on the eastern borders of Peru, at an elevation of 3000 feet and

Wax Palm (*Ceroxylon andicola*).

upwards above the level of the sea. It grows to the height of 160 feet, and on the cicatrices of the fallen leaves, a resinous secretion is produced in great abundance, composed of about two parts of yellow resin, and one of a kind of wax, more brittle than bees' wax. This wax exudes also from the leaves, and is whitish, almost inodorous, except when heated, when it gives out a resinous odour. It is used by the inhabitants of the country in which it is produced for making candles, but is usually mixed with wax or tallow. It is probable that the **W. P.** would succeed well in the south of Europe, as its native climate is not dissimilar. The usual method of obtaining the wax is by felling the tree. Each tree yields about 25 lbs. The

wax is scraped off, melted, and run into calabashes. The timber of this palm is very hard and durable; the leaves are used for thatching, and the fibres for cordage. The tree is a beautiful one, with a stately stem, and a head of large pinnate leaves.—In some of the northern provinces of Brazil, wax is obtained from the *Carnauba Palm* (q. v.).

WAX-SCULPTURE. The use of wax for sculpture is believed to be of very ancient origin; and not only have the tombs of Southern Italy yielded many specimens of the portraits of the deceased modelled in wax, but many fine bronzes in antiquarian collections bear evident marks of having been modelled in wax by the process called *cire-perdue*. This consists in producing a model in wax, and then coating it with clay or other material in a soft state; this is allowed to harden; and the wax is then melted out by heat, and the molten metal poured in. A very fine cast of the wax-figure is thus obtained; but, of course, the wax-model of the artist is lost, after the first copy is taken; hence, such specimens are very highly prized by connoisseurs. During the 14th and 15th centuries, the art of modelling in wax, or ceroplastics, was much practised, especially in Italy and in Germany, by many of the first artists, even Michael Angelo not excepted; and many of their original works in wax are still preserved. They were chiefly, however, in low relief, although very fine statuettes were also produced by men of great enataue.

WAX-TREE (*Vismia*), a genus of plants of the natural order *Hypericaceae*, having a 5-parted calyx, and 5 petals, generally covered with soft hairs on the inside. All the species yield a yellow viscid juice when wounded, which, when dried, becomes somewhat similar to gamboge. The species are natives of the tropical parts of America.

WAXWING (*Bombycilla*), a genus of birds of the family *Ampelidae*, or Chatterers (q. v.), having a short, straight, elevated bill, with a very wide gape, as in the Fly-catchers, but without bristles; both mandibles notched at the tip; the wings rather long, broad, and pointed; the legs short; the toes

Bohemian Chatterer (*Bombycilla garrula*).

long, with sharp and curved claws. The name *W.* is derived from a very peculiar character, which the wings exhibit; some of the secondaries and tertiaries terminating in horny expansions of the shaft, resembling small pieces of red sealing-wax. The species are few, but widely diffused over the colder parts of the northern hemisphere. The only European species is the EUROPEAN *W.*, or BOHEMIAN CHATTERER (*B. garrula*), which is found in summer in the arctic regions of Europe, Asia, and America, migrating southwards in winter,

sometimes as far as the shores of the Mediterranean; most abundant in America, during winter, about the great lakes and the northern part of the Valley of the Mississippi. It is found also in Japan. It is only an occasional winter-visitant of Britain. In some winters, numerous flocks are seen; in other winters, and more generally, none at all. It is in severe winters that this bird is most frequently seen in Britain, and in the more southern parts of Europe. It is gregarious in winter, and the flocks are often large. It feeds on insects and worms, seeds, berries, and other fruits. It is a handsome bird, nearly as large as the Song Thrush; reddish gray, with a black patch on the throat, and a black band on the forehead; the tail-coverts brownish orange; the primaries, secondaries, and tail-feathers tipped with yellow, two white bands on the wings; the lower parts silvery gray. The head is surmounted by an erectile crest of brownish orange feathers. The song of the *W.* is a weak whistling, bearing a little resemblance to that of the thrush. It is easily tamed. The flesh is said to be delicate food.—The AMERICAN *W.*, or Cedar Bird (*B. cedrorum*, or *Carolinensis*), is a very similar, but smaller species, found only in North America, from Canada to Central America, less migratory, and never visiting arctic regions. The general colour is reddish olive, passing into purplish cinnamon in front, and into ash-colour behind; the chin black; no white on the wings; the lower parts yellow. It is crested like the European Waxwing. Great flocks of cedar birds collect in the end of summer. They feed on berries, and are particularly fond of those of the Red Cedar. The Cedar Bird is extremely voracious, and when food abounds, sometimes gorges itself so much, that it may be taken by the hand. It is in much esteem for the table.—Another species is found in Japan, having no waxy drops on the wings.

WAXY DEGENERATION is a morbid process in which the healthy tissue of various organs is transformed into a peculiar substance, allied in some respects to amyloid compounds, and in others to albuminous substances. Organs affected by this degeneration have a certain resemblance in consistency and physical character to wax. They may be cut into portions of the most regular shape, with sharp angles and smooth surfaces; and the thinnest possible slices may be removed by a sharp knife for microscopical examination. Such organs are abnormally translucent, increased in volume, solidity, and weight. Usually, the first parts affected by this degeneration are the small blood-vessels, the middle or muscular coat being first changed. Subsequently, the secreting cells become similarly affected. When a solution of iodine is brought in contact with such tissues, a very deep violet red colour is produced; and this deep red colour is alone a sufficiently characteristic test. Although amyloid degeneration is common to many tissues and organs, the parts most frequently affected are the spleen, liver, and kidneys. This morbid condition in one or more organs is the expression of a general pathological state, the conditions and relations of which are as yet but little known.

WAYLAND, the Smith (Ang.-Sax. *VELAND*; old Norse, *VÖLUNDR*; Ger. *WIELAND*), was, according to the old German Saga (the principal traits of which are already contained in the older Edda, but which is related in the most detailed form in the *Viltinasaga*), a son of the sea-giant Wate, a nephew of King Wilkinus, and of the sea-nymph Wac-hilt. His father had bound him, at first, apprentice to the celebrated smith Mimi, then took him across the sea to the most skilful dwarfs, from

whom he not only soon learned all their science, but far surpassed them.* He afterwards dwelt a long time in Ulfdaler (the Wolf's Valley, which, by comparison with other Sagas, appears to correspond to the Greek Labyrinth) along with his two brothers—Egil, the best archer, to whom the oldest form of the Tell legend attaches; and Slagfidr, whom the saga has not further characterised. The brothers here met three swan-nymphs, and lived with them for seven years, when they flew away to follow battles as Walkyries (q. v.). Afterwards, W. came to King Nidung, who made him lame, by cutting the sinews of his feet, and put him in prison, for which W. revenged himself by putting the king's two sons to death, and violating his daughter Beadchild, who afterwards gave birth to Wittich, a powerful champion of the German hero-legends. W. then flew away in a feather-robe, which he himself manufactured, and which his brother Egil had tried first, but was precipitated to the ground. Skillfully putting together and supplementing the various old legends, Simrock has produced the Saga of W., as a whole, in his poem *Wieland der Schmied* (Bonn, 1835), and in the 4th part of his *Heldenbuch* (Stuttg. 1843). The legend was a favourite one among all the Germanic nations, as is shewn by the frequent allusions to it in Scandinavian, Anglo-Saxon, English, and German poems, as well as by the numerous fragments yet extant in oral tradition throughout all Teutonic countries. The German poems to which the Völsungasaga appeals, which were in existence up to the 13th c., have been utterly lost. Even beyond the bounds of Germany, old French poems and traditions tell of Gallans the smith. See Depping and Michel, *Veland le Forgeron* (Par. 1833). The legend of W. is in fact one of those myths common to the Indo-Germanic family. Besides the German tradition, it is found most distinctly among the Greeks, in the different stories of Dædalus, Hephaestus, Erichthonius, and so forth. Next to Jacob Grimm's profound discussion in the *German Mythology*, Kuhn has pointed out in the best manner the signification and ramifications of the myth in his treatise, *Die Sprachvergleichung und die Uhrgeschichte der Germ. Völker*, in the *Zeitschrift für vergleichende Sprachforschung* (vol. iv., Berl. 1854).

WAYNE, ANTHONY, an American general of the war of the Revolution, was born at Waynesborough, Pennsylvania, January 1, 1745. His grandfather, a native of Yorkshire, commanded a squadron of dragoons at the battle of the Boyne, and emigrated to Pennsylvania. Anthony was educated at Philadelphia; at the age of 18, he was employed as a land-surveyor, and was selected by Benjamin Franklin to form a projected settlement in Nova Scotia. At the beginning of the American revolution (1775), he was married and settled on a farm in Pennsylvania, taking an active interest in politics, and became a member of a Committee of Safety, and studied military drill and tactics. At the outbreak of hostilities, he raised a regiment of volunteers, of which he was appointed colonel, and sent to Canada, where he covered the retreat of the provincial forces at Three Rivers. He commanded at Ticonderoga until 1777, when he was made Brigadier-general, and joined Washington in New Jersey; commanded the rearguard in the retreat at Brandywine; led the attack at Germantown; captured supplies for the distressed army at Valley Forge; distinguished himself at Monmouth; was defeated at Paoli; but achieved the most brilliant

victory of the war in the storming of Stony Point (q. v.), July 15, 1779. His courage and skill saved Lafayette in Virginia in 1780; and he aided in the siege of Yorktown, and commanded in Georgia. At the close of the war, rewarded by popular enthusiasm, and having, by his dash and audacity, acquired the sobriquet of 'Mad Anthony,' he retired to his farm at Waynesborough, and engaged in promoting the construction of roads and canals. In 1792, he commanded a successful expedition against the Indians of the north-western territories; where he remained, until 1796, as United States' Commissioner. He died at the garrison at Presque Isle (now Erie), December 14, 1796.

WAYS AND MEANS, COMMITTEE OF, a committee of the House of Commons appointed to determine the modes of raising the money which the House—after resolutions reported from the Committee of Supply, and agreed to—have granted to the crown. Like the Committee of Supply, it is always a committee of the whole House. A chairman, elected by the Committee of Supply, but known as the Chairman of the Committee of Ways and Means, presides over both committees. One of the most important occasions for which the Committee sits is to receive the Budget, or annual financial statement of the year from the Chancellor of the Exchequer. The propositions of the government regarding loans, duties, taxes, tolls, and any other means for raising revenue, are submitted to the consideration of the Committee of Ways and Means in the shape of resolutions. The amount proposed to be raised must not exceed the sum granted in the Committee of Supply; and the Chancellor of the Exchequer is bound to satisfy the House, by a detail of the sums granted for the several services, that the amount of these sums will be a sufficient justification, in point of quantity, to the Committee of Ways and Means to adopt such measures and impose such taxes as shall then be recommended. Such resolutions as are agreed to are adopted and embodied in bills, and in due time become law. See SUPPLY, COMMITTEE OF; PARLIAMENT.

WEALDEN FORMATION, a series of freshwater strata belonging to the lower Cretaceous epoch. Having been originally studied in the parts of Kent, Surrey, and Sussex called the Weald, this local name was given to the formation. It has been divided into two series, which do not differ very materially from each other, viz., Weald Clay, 560 feet; Hastings Sand, 740; total, 1300. The Weald Clay consists of blue and brown clay and shale with thin beds of sandstone and shaly limestone. These strata were probably lake or estuary deposits, and contain the remains of the land flora and fauna, often in great abundance. The beds of limestone, called Sussex Marble, are almost entirely composed of a species of *Paludina*, not very different from the common *P. vivipara* of English rivers. The clays are often laminated by thin layers, consisting of immense numbers of the shells of minute *Cyprides*. But the most remarkable animal remains are those of the huge reptiles which lived on the land, tenanted the air, or abounded in the sea, such as the Iguanodon (q. v.), Hylæosaurus (q. v.), Pterodactyl (q. v.), and the numerous species of turtles which have been described from these strata. The vegetable fossils belong chiefly to ferns, and to the gymnospermatous orders of Conifers and Cycads; the fruits of several species of both orders have been found; and in some places, the rolled trunks of *Endogenites* and *Clathraria*, belonging to Cycada, and of different species of coniferous wood, occur in enormous quantities, as at Brook Point, in the Isle

* The name Wayland is from a root signifying art, cunning; from which come Eng. *wile* and (through old Fr.) *guile*. Ang.-Sax. *welan* means to fabricate.

of Wight, where the shore at low-water is strewn with them.

The Hastings beds contain more sandstone and less clay than those of the upper Weald Clays. The picturesque scenery of the High Rocks and other places in the neighbourhood of Tunbridge, is weathered out of the beds of white sandstone belonging to this period. The remains of the huge Wealden reptiles abound in the sandstones of this division. The Tilgate forest-beds, where Dr Mantell first found the Iguanodon, and the rocks in the neighbourhood of Hastings, are the best known repositories of those remarkable fossils.

The deposition of the Wealden beds was followed by a gradual depression of the land, when these fresh-water deposits were covered by the estuary beds of the newer *Greensand*. The depression continued until the fresh-water and estuary strata formed the bottom of a deep sea, on which were deposited the immense beds of chalk and allied strata which form the bulk of the Cretaceous series. In the process of elevation, these beds have suffered denudation, so that districts which were covered with Cretaceous beds have been cleared of them, and immense valleys have been furrowed through the Chalk, Greensand, and Wealden.

WEALTH. See CAPITAL.

WEANING, AND FEEDING IN INFANCY. The propriety of mothers nursing their own children is now so universally acknowledged, that it is the duty of the physician less frequently to urge maternal nursing than to indicate those cases in which it becomes necessary to substitute another mode of rearing the infant. 'Women,' says Dr Munnell, 'who labour under any mortal or weakening disease—as phthisis, hemorrhages, epilepsy—are obviously disqualified from the office of nurse. Some who are in other respects healthy, have breasts incapable of secreting a sufficient supply of milk. In other instances, the breast may perform its functions well, but the nipple may be naturally so small, or may be so completely obliterated by the pressure of tight stays, as not to admit of its being laid hold of by the child. These are actual physical hindrances to nursing. Again, women may, and, in the higher classes, frequently do, possess such extremely sensitive and excitable temperaments, as will render it imprudent for them to suckle their own children. Frightened and excited by every accidental change in the infant's countenance, and inordinately moved by the common agitations of life, such persons are kept in a state of continual fever, which materially interferes with the formation of milk both as to quantity and quality. Women, also, who become mothers for the first time at a late period of life, have seldom the flexibility of disposition or the physical aptitude for the secretion of milk, required to constitute a good nurse.'—*A Treatise on the Management and Diseases of Children*, 4th ed., 1842, pp. 39, 40. In ordinary cases, the child should be put to the breast as soon as the latter begins to contain anything; and when the secretion of milk has fairly commenced, it will require no other food until the seventh or eighth month, provided the mother be a good nurse. During the first five or six months, the infant should be put to the breast at regular intervals of about four hours; afterwards, when the teeth are beginning to appear, the child need not suck more than four times in the twenty-four hours, some artificial food being given to it twice during the same period. This at first may consist of soft bread steeped in hot water, with the addition of sugar and cow's milk; and subsequently a little broth, free from salt and vegetables, may be given once a day. The spoon is now

the best medium of feeding, as the food should be more solid than could be drawn through the sucking-bottle. The time of weaning should be that indicated by nature, when, by providing the child with teeth, she furnishes it with the means of obtaining its nourishment from substances more solid than milk. If the infant has been gradually accustomed to a diminished supply of maternal and an increase of artificial food, weaning will be a comparatively easy process; and much of that suffering both to parent and child will be spared, which commonly ensues when a sudden change is made. In ordinary cases, the period of weaning varies from the seventh to the twelfth month; sometimes the child is kept at the breast for a much longer period, from the popular idea that lactation prevents pregnancy, but such unnaturally prolonged lactation is usually injurious to both mother and child.

In those cases in which it is inexpedient or impossible for a mother to suckle her own child, the choice of a wet-nurse becomes a subject of much importance. Upon this subject, Dr Munnell lays down the following important practical rules: 'The great thing we have to look to is to ascertain that both the woman and her child are in good health; and of this we must endeavour to judge by the following signs: The woman's general appearance and form should be observed, and they ought to be such as betoken a sound constitution. Her skin should be free from eruptions; her tongue clean, and indicating a healthy digestion; her gums and teeth sound and perfect; the breasts should be firm and well formed—not too large or flabby—and with perfect, well-developed nipples. We should see that the milk flows freely, upon slight pressure; and we should allow a little of it to remain in a glass in order that we may judge of its quality. It should be thin, and of a bluish-white colour; sweet to the taste; and when allowed to stand, should throw up a considerable quantity of cream. A nurse should not be old, but it is better that she should have had one or two children before, as she will then be likely to have more milk, and may be supposed to have acquired experience in the management of infants. Having examined the mother, we must next turn to the child, which should be well nourished, clean, and free from eruptions, especially on the head and buttocks. We should also carefully examine its mouth, to ascertain that it is free from sores or aphthæ. If both woman and child bear such an examination, we may with tolerable security pronounce the former to be likely to prove a good nurse.'—*Op. cit.*, pp. 44, 45. In one respect, we differ from this eminent physician. He holds that 'the more recently the nurse's own confinement has taken place, provided she has recovered from its effects, the better.' Supposing a nurse is required for a new-born infant, this rule holds good; but provided a nurse is required for an infant of three or four months old (for example), it is preferable to obtain a nurse whose milk is of that age. We believe it to be a general physiological law that the age of the milk should correspond to the age of the infant; that is to say, that an infant taken at any given age from its mother, before the normal period of weaning, should be provided with a nurse who was confined about the same time as its own mother.

A wet-nurse should be very much preferred to any kind of artificial feeding; but peculiar cases may occur in which it is impossible to procure a nurse; or an infant whose mother is incapable of nourishing it may be the subject of a disease that may be transmitted through the infant to the nurse. In these cases, a food must be provided as nearly as possible resembling the natural food; and this is naturally

WEANING—WEASEL.

sought for among the food of animals. The milk of the cow is most commonly used, in consequence of its being the most easily obtained; but ass's milk more nearly resembles human milk, as is shewn from the following comparative analyses by Professor Playfair:

| | Woman. | Cow. | Ass. |
|--------------------|--------|------|------|
| Casein, | 1.5 | 4.0 | 1.9 |
| Butter, | 4.4 | 4.6 | 1.3 |
| Sugar, | 5.7 | 3.8 | 6.3 |
| Albumen, | 0.5 | 0.6 | ... |
| Water, | 88.0 | 89.0 | 90.5 |

The most important difference between cow's milk and woman's milk is the great excess of casein in the former. The former fluid may, however, be made to resemble the latter in composition in either of the following ways: (1) On gently heating cow's milk, a membrane of casein forms on the surface; by removing two or three of these membranes as they form, we can reduce the quantity of casein to the desired extent; or (2) we may dilute cow's milk with twice its bulk of pure water, and add a little sugar. This food should be administered at a natural temperature (of about 98°) through a sucking-bottle; and as the child grows older, it will soon be able to take natural cow's milk without inconvenience. The nature and importance of the mixture of milk and farinaceous food known as Liebig's Soup for Children, are described under SOUP.

The rules regarding the times, &c. of feeding are similar to those laid down for suckling. Assuming that the infant, whether brought up at the breast or artificially reared, has been safely weaned, we have to consider what rules should be laid down regarding its food subsequently. For some months after weaning, the food should consist principally of semi-fluid substances, such as milk thickened with baked flour, or pap, to which a little sugar should be added. Light broths may also be administered, especially in the occasional cases in which milk seems to disagree; and bread and butter may be tried in small quantity. We shall conclude this article with the following 'model of a suitable diet for children,' which cannot be too strongly impressed upon the minds of all young mothers. 'A healthy child, of two or three years old, commonly awakes hungry and thirsty at five or six o'clock in the morning, sometimes even earlier. Immediately after awaking, a little bread and sweet milk should be given to it, or (when the child is too young to eat bread) a little bread-pap. The latter should be warm; but in the former case, the bread may be eaten from the hand, and the milk allowed to be drunk cold, as it is well at this meal to furnish no inducement for eating beyond that of hunger. After eating, the child will generally sleep again for an hour or two; and about nine o'clock it should get its second meal, of bread softened in hot water, which latter is to be drained off, and fresh milk and a little sugar added to the bread. Between one and two, the child may have dinner, consisting, at the younger ages, of beef, mutton, or chicken broth (deprived of all fat), and bread. When a sufficient number of teeth are developed to admit of chewing being performed, a little animal food, as chicken, roast, or boiled mutton, or beef, not too much dressed, should be allowed, with a potato or bread, and some fresh, well-dressed vegetable, as turnips or cauliflower. After dinner, some drink will be requisite; and a healthy child requires, and indeed wishes for nothing but water. Light, fresh table-beer would not be injurious to a child of four or five years old, but it is unnecessary. Between six and seven o'clock, the child may have its last meal of bread steeped in water, &c., as at nine o'clock in the morning. A healthy child which has been in

the open air during the greater part of the day, will be ready for bed shortly after this last supply, and will require nothing more till next morning. Similar regimen and hours may be adopted throughout the whole period of childhood; only as the fourth or fifth year approaches, giving, for breakfast and supper, bread and milk without water, and either warm or cold, according to the weather or the child's inclination. The supply of food upon first awaking in the morning may also be gradually discontinued, and breakfast be given somewhat earlier.'—*Op. cit.*, pp. 80, 81.

WEASEL (*Mustela*), a genus of quadrupeds of the family *Mustelidae* (q. v.), having a very elongated body; short feet, with toes quite separate, and sharp claws; four molar teeth on each side above, and five below. The COMMON W. (*M. vulgaris*) is a native of almost all the temperate and cold parts of the northern hemisphere, except the most arctic regions. Its range does not extend quite so far north as that

Weasel (*Mustela vulgaris*).

of the ermine. It is the smallest of the *Mustelidae* of the Old World, not exceeding two inches and a half in height, and seven inches and a half in length, from nose to tail; the tail about two inches and a half long, and terminating in a point, not so bushy as that of the stoat or ermine. The female is smaller than the male. The head is large; the ears short, broad, and rounded, the whiskers long. The colour is reddish brown on the upper parts, sides, legs, and tail; the throat and belly white. The eyes are small, round, and black, with a very keen expression, to which the whole habits of the animal correspond. It is nimble and active, bold, and yet wary. It may often be seen peeping curiously from a hole in a wall, but vainly does the schoolboy attempt to strike it with a stone. Catching it is out of the question for him, and so far well, for it is ready to bite severely. It is a most persevering hunter, its scent as keen as its sight, quarters the ground like a dog, and wearies out animals larger and apparently much stronger than itself. It preys on mice, rats, voles, small birds, and other small animals, sometimes even on hares and rabbits, robs birds' nests, devouring the young birds or sucking the eggs, and is occasionally troublesome in poultry-yards, killing young chickens. It climbs walls and trees with great agility, and does not hesitate to plunge into water in pursuit of the water-rat. It sometimes begins by sucking the blood of the animal which it has killed, and generally devours the brain; but when food is abundant, it carries the body to its retreat, where a considerable quantity of prey is often found, the W. preferring to eat it in a half-putrefied state. The W. generally sleeps during the day, and is most active at night. It has a disagreeable smell, which is strongest in hot weather, or when it has been pursued or irritated. It is capable of being tamed when taken young, and becomes docile and gentle. The female W. makes a nest of straw-leaves and moss for her young, which are produced in spring, four or five in a litter; often in a crevice of a bank, or in a hollow

tree. The fur of the W. is an article of commerce in some northern countries, and W.-skins are exported in considerable quantity from Siberia to China. The W. sometimes, but rarely, becomes white in winter, like the ermine.—The Ermine (q. v.), or Stoat, is another species of weasel.—America has several species of W., of which one (*M. pusilla*) is rather smaller than the Common W. of Europe, and has a shorter tail. It is abundant in the northern parts of the United States, and its range extends far to the north. In the United States, it remains brown all winter; but in the fur-countries it becomes white.

WEATHER is the condition of the atmosphere at any time in respect of heat, moisture, wind, rain, cloud, and electricity; and a change of weather implies a change in one or more of these elements. From the direct bearing weather-changes have on human interests, they have from the earliest times been closely watched, so that the causes by which they are brought about being discovered, their approach might be predicted with some degree of confidence. The craving in the popular mind for this knowledge is strongly attested by the prognostics of the weather current in every language, which, amid much that is shrewd and of considerable practical value, embrace more that is vague, and not a little that is positively absurd.

It is not necessary here to refer to Moore, Zadkiel, and other almanac-makers of that class, except as proving by their mere existence a widespread ignorance of even the most palpable elements of physical law, which is a disgrace to the educational system of the country. Prognosticators of higher pretensions repeatedly appear before the public, and it is curious to note how their predictions are eagerly laid hold of by the newspapers, and scattered broadcast over the country. Among the latest of this class was Mathieu de la Drome, whose predictions of storms and rains made so much noise, that the Emperor Napoleon requested the celebrated Leverrier to examine the grounds on which the predictions were founded. The exposure was complete. One of his principal predictions was based entirely on a high average of the rainfall at a particular season. On examining the rainfall of the particular years of which the average had been taken, it was found that the excess was entirely due to an unprecedentedly heavy rain which occurred in one of the years at that season. His fame was founded on a few happy hits, and on his death occurring a short time after he began to issue predictions of the weather. One of the most remarkable predictions of recent times was that made by an Irish nobleman in reference to the weather of September 1865, which turned out to be in accordance with the prediction—dry, warm, and fine, beyond precedent. The celebrity of this prediction has, however, been greatly reduced by other predictions made since, which the events, unfortunately have not verified.

The changes of the moon were long, and in many minds are still, regarded as supplying the elements of prediction. In order to test the real value of the moon's changes on the weather, the Greenwich observations of 50 years were carefully examined, and it was found that the number of instances in which the weather was in accordance with the prognostication was one instance less than those in which the weather was different. When brought to the test of accurate examination and figures, the theory of the moon's changes on the coming weather is thus proved to be a complete delusion; but since most people have a bias towards forgetting the unsuccessful prognostications, and remembering the successful ones, the theory will likely continue to

be believed in, at least until some knowledge of the natural laws be more generally diffused, so as to reveal its absurdity.

For some years, Mr Thomas du Boulay predicted the general character of the weather of each summer from the weather-conditions which prevailed during the week of the spring equinox preceding, believing that the general character of the weather of the next six months is already settled, and that it only requires the necessary skill to read its features, since these will remain generally constant till autumn. For a few years, he speculated in grain on the faith of the predictions, which turned out pretty correct. Latterly, the predictions have not been verified.

The truth is, that no prediction of the weather can be made, in the British Islands at least, for more than three, or perhaps only two days beforehand. Any attempt at a longer prediction is illusory. We would here refer to the article STORMS, as shewing the possibility and mode of making real predictions of the weather. Almost all the weather-changes of Europe begin from the south-west, and pass over Great Britain to the north-east. Unsettled or bad weather is accompanied with a low barometer; elsewhere, the barometer is higher. Thus, then, suppose that, from weather-telegrams received, it is seen that everywhere in Europe barometers are high, we may be sure that no storm need be dreaded for two days at least. But if, on the following morning, barometers begin to fall a little in the west of Ireland, and an easterly wind begins to blow generally over Great Britain and Norway, and a south-east wind over France; then, since the winds blow towards the lowest barometer, or rather a little towards the right of it, the presumption is that a storm of greater or less severity is coming up, the centre of which is likely to pass over England. This ought, therefore, to be closely watched by the telegraph; and if the winds keeping in nearly the same direction, or veering slowly towards the south and west, increase in force, and barometers in the west of Ireland fall rapidly, a great storm is portended, of the approach of which warning should be at once telegraphed to the different seaports. But if, on the contrary, the winds do not increase in force, and the barometer fall slightly, or cease to fall, the storm has either passed considerably to the north of the British Islands, or its approach will be delayed for some time yet; and hence, no immediate warning is necessary.

It is our proximity to the Atlantic that makes it impossible to predict the weather beyond three days at the utmost. In Norway and the Baltic, and places towards the east of Europe, the weather may be predicted for a longer time, since each storm as it appears in the west may be followed in its course by the telegraph, and the places which it threatens be warned of the coming danger. In America also, where storms chiefly advance from west to east, gales and unsettled weather are predicted at the sea-board in the east some days before.

But the collecting of this information by the telegraph is a work which, owing to the expense, governments only can accomplish; and from its importance, it is an incumbent duty which they should discharge for the benefit of the seafaring population. From the great value of weather-telegrams to persons interested in shipping, we believe that the time is not far distant when each of our chief seaports will be supplied with daily telegrams of the barometer and the winds from five or six places, at some distance, and in different directions, from the particular seaport. A good deal may, however, be done by each one for himself, by

observing his barometer, the winds, and the face of the sky—especially the cirrus cloud—the most elevated and delicate of the clouds. But ere these simple observations can be turned to account, and made the basis of an intelligent prediction, some knowledge of the general features of Storms (q. v.) is indispensable. These specially—(1) Storms have a circular area; and (2) advance in an easterly direction, bearing a low barometric pressure with them. (3) Winds blow from a high to a low barometer, and (4) with a force proportioned to the difference of the pressure. (5) Storms are first felt in the upper regions of the atmosphere, or in the region of the cirrus cloud; and (6) in front of the storm the air is warm and humid; in the rear of it, cold, or cool and dry. With such observations (requiring only a barometer), intelligently interpreted, particularly if hills form part of the landscape, the character of the weather may be foreseen for one day, or longer.

But though no prediction of the weather for weeks or months beforehand can be made with any pretensions to trustworthiness, yet guesses or surmises may be formed which are not without value. All observation goes to prove that predictions based on solar or other astronomical causes are without foundation, and that averages based on terrestrial observations are the only guides we have in this matter. Of this class are the interruptions which occur in the regular march of temperature in the course of the year. Thus, cold weather generally prevails from the 11th to the 14th of April—that is, the period of the 'borrowing days' (O. S.), and in the second week of May; and these, with some other cold and warm periods, are almost co-extensive with the northern hemisphere of the globe. Hence, then, at these times, when the weather begins to get cold or warm, it may safely be predicted that such weather will last for several days. Again, if, after a long-continued prevalence of south-west winds, or the equatorial current, the polar current, or north-east wind, should set in, it is highly probable that easterly winds will prevail for some time; so that, if the season be winter, a continuance of frost, and perhaps snow, may be looked for; but if midsummer, the weather will become dry, warm, and bracing. But suppose easterly winds have been unusually predominant in autumn, and south-westerly winds begin to prevail in the end of November or beginning of December, it is most probable that the weather will continue exceptionally mild, with frequent heavy storms of wind and rain, till about Christmas. This period occurs nearly every year, and its commencement is popularly known as St Martin's summer. If easterly winds preponderate greatly above the average during the spring months, the summer is likely to be characterised by south-westerly winds, with much rain and moisture, and little sunshine; but if easterly winds nearly fail in spring, the summer will be dry and warm, it being expected that the polar current will prevail in summer, bringing clear skies and brilliant sunshine. This latter forecast of the summer is believed in by the Rev. L. Jenyns, and several meteorologists of note; but an examination of the weather of the past eleven years shews that it is only generally true.—See Rev. Leonard Jenyns' *Meteorology* (1858); *Popular Prognostics of the Weather in Scotland*, by Arthur Mitchell, M.D.; *Journal of Scottish Meteorological Society*, No. xiii.—'Interruptions of Temperature.'

WEATHERING, a slight inclination given to the top of a cornice or moulding, to prevent water from lodging on it.

WEAVER-BIRD (*Ploceus*), a genus of birds of

the Finch family (*Fringillidae*), of a group or sub-family (*Ploceinae*), to most of which the name Weaver-bird is extended. The name has reference to the remarkable structure of the nests of these birds, which are woven in a very wonderful manner of various vegetable substances, and are objects of great interest. The *Ploceinae* are natives of the warmer parts of Asia, of Africa, and of Australia;

Taha Weaver-bird (*Ploceus Taha*).

none being found in Europe nor in America. The species are numerous. They are small birds, with a strong conical bill, the ridge of which is slightly curved, the tip entire. The claws are large and very long. The wings are pointed, the first quill remarkably short. There is great diversity in the form and appearance of the nests constructed by different species. One of the best-known species is the PHILIPPINE WEAVER (*P. Philippinus*), the BAYA (q. v.) of India.—Many of the other weaver-birds construct nests pretty much on the same plan with this—pouches elongated into tubes, entering from below; those of some are kidney-shaped, and the entrance is in the side. They very generally suspend their nests in the same way from the extremities of branches, and often prefer branches which hang over water, probably as affording further security against monkeys, squirrels, snakes, and other enemies. Social habits are very prevalent

Nest of Pensile Weaver-bird.

among them, and many nests of the same species are often found close together. Some of them attach the nest of one year to that of the year preceding, as the *Ploceus pensilis* of Madagascar, which sometimes thus makes five nests in succession, one hanging to another. Some of the African species build their nests in company, the whole forming one structure. Thus, the SOCIAL or REPUBLICAN

W. of South Africa (*Ploceus socius* or *Philoterus lepidus*) constructs a kind of umbrella-like roof, under which 800 or 1000 nests have been found, the nests like the cells of a honeycomb, and arranged with wonderful regularity. An acacia with straight smooth stem, such as predaceous animals cannot easily climb, is often selected by the bird-community. When the situation is chosen, the birds begin by constructing the roof, which is made of coarse grass, each pair afterwards building their own nest, which is attached to the roof. As new nests are built every year, the weight of the structure often becomes so great as to break down its support.—*Textor erythrorhynchus* is a bird of the W. group, which is commonly seen in South Africa accompanying herds of buffaloes, and feeding on the bots and other insects which infest them, alighting on their backs to pick them out of the hide. The bird is often of great use to the buffalo in another way, by giving warning of the approach of an enemy.—The Whydow Birds (q. v.), or Widow Birds, likewise belong to the group of *Ploceinae*.

WEAVING, the art by which threads or yarns of any substance are interlaced so as to form a continuous web. It is perhaps the most ancient of the manufacturing arts, for clothing was always a first necessity of mankind. The methods by which weaving is now accomplished have been explained and illustrated under LOOM (q. v.); it therefore only remains to describe the variations which may be effected by ingenious applications of the powers of the loom; and as these are almost endless, some of the more common and easily understood will be chosen. The simplest form of weaving is that employed in making the mats of uncivilised nations. These consist of single untwisted fibres, usually vegetable, arranged side by side to the width required, and of the length of the fibres themselves, which are tied at each end to a stick, which is so fixed as to keep the fibres straight, and on the same plane, as in fig. 1. Then the weaver lifts up

Fig. 1.

every other of these longitudinal threads, and passes under it a transverse one, which he first attaches by tying or twisting to the outermost fibre of the side he commences with, and afterwards in the same way to that on the other side, when it has passed through the whole series. The acquisition of the art of spinning threads of any length enables more advanced nations to give great length to the warp, or series of threads which are first arranged, and to pass the weft or transverse thread backwards, and forwards by means of a shuttle, without the necessity of fixing at the sides. The mechanical appliances already described under LOOM aid these operations to an amazing extent. That kind of weaving which consists of passing the weft alternately over and under each thread of the warp is called *plain*

weaving, and a transverse section of the web would be represented by fig. 2; but if the weaver takes up first one and then two threads alternately of the warp series, and passes the weft under them for the first shoot of his shuttle, and raises those which

Fig. 2.

were left down before for the second shoot, he produces a cloth with a very different appearance, called TWILL (q. v.), many varieties of which may be produced by varying the numbers missed or taken up—as, for example, one and three, instead of one and

Fig. 3.

two. The simplest form of twill, viewed transversely, would be represented by fig. 3.

There are few arts which require more patience or skill than weaving. As many as from one to two thousand threads often constitute the warp; and these threads may be so varied in quality (see YARN) as to produce many varieties of fabric. From that cause alone, there are almost infinite variations. Many may be produced by the order in which the threads are lifted for the passage of the weft—that of itself can also vary as much or more in its quality and other circumstances, so that the inventive genius of the weaver finds incessant opportunities for its display, and nice arithmetical calculations are required in estimating and allotting the numerous threads to the endless variety of patterns which are constantly passing through the looms. A really practical knowledge of weaving can only be obtained by working with looms, and studying such technical treatises as Watson's *Theory and Practice of the Art of Weaving*, and some of the elaborate treatises by the French weavers.

WEBER, CARL MARIA VON, a musical composer of high eminence, was born at Eutin in Holstein, 18th December 1786. Musical and dramatic talent had been hereditary in his family for some generations: his father, by turns officer in the army of the Palatinate, finance minister of the Elector of Cologne, music-director to the Prince Bishop of Eutin, and head of a company of strolling players, led a somewhat irregular and checkered life. Young W. shewed early a genius for music, but his instructors were often changed, in consequence of his father's change of residence. The teachers to whom he owed most were Hauschkel at Hildburghausen, Michael Haydn at Salzburg, and Valesi and Kalcher at Munich. His father's impatience and want of judgment were injurious to him in many ways, particularly in the efforts made to bring him before the public prematurely as a musical prodigy. At the age of 13, he composed an opera called *Die Macht der Liebe und des Weins*. When but 14, his second opera, *Das Waldmädchen*, was brought out, without much success at first; but was afterwards far better received than he himself thought it deserved. The next effort of the young opera-composer was *Peter Schmall und seine Nachbarn*, composed at Salzburg in 1801, and performed at Vienna with but indifferent success. At Vienna, he became acquainted, in 1803, with Joseph Haydn and the Abbé Vogler, and studied for some time under the latter. In 1804, he left Vienna, to be conductor of the Opera at Breslau, and while resident there, composed the greater part of his opera of *Bübenahl*.

We next find him, in 1806, with Prince Eugene of Württemberg at his court of Karlsruhe in Silesia, where he composed two symphonies and three concertos. In 1807, he went to Stuttgart, as private secretary to Duke Ludwig, becoming also musical instructor to his children; and while there, he composed the opera of *Silvana*, and a cantata called *Der erste Ton*, besides overtures, choral pieces, and pianoforte works. Getting into disfavour and pecuniary embarrassments, the result of his father's recklessness, he was dismissed the court of Württemberg, and took up his residence successively in Mannheim, Heidelberg, and Darmstadt, at which last place he composed his operetta of *Abu Hassan*. He then made a musical tour through Germany, during which his concerts were everywhere well attended. From 1813 to 1816, he was director of the Opera at Prague, which he entirely remodelled; and during his residence in the Bohemian capital composed *Kampf und Sieg*, and numerous other songs, including that noble national series from Körner's *Leier und Schwert*, which had no little influence in rousing patriotic sentiment during the war of liberation.

In 1817, he was invited to form a German Opera at Dresden; and there, during the remainder of his life, he held the post of *Kapellmeister* to the king of Saxony. To this period belong his most important compositions, including *Preciosa*, *Der Freischütz*, *Buryanthe*, and *Oberon*. None of these works, however, were first brought out in Dresden. The music to Wolff's *Preciosa*, the subject of which is taken from a novel by Cervantes, was first produced on the Berlin stage, where it made a powerful impression. The author's *chef-d'œuvre*, the opera of *Freischütz*, the libretto of which was written by the composer's friend, Friedrich Kind, also first saw the light in the Prussian capital in 1822. It was a great success: its novelty and beauty, as well as the deep thought contained in it, excited an extraordinary sensation throughout Germany, which soon extended to France and England. *Buryanthe*, produced in Vienna in 1823, was not quite so warmly received. Bearing more the impress of labour and cultivation, and less that of the composer's natural vein of romance, it has never been in such general favour as its predecessor. *Oberon* was written in prospect of a visit to London to a libretto supplied by Mr Planché. When W. set out for England, he was already struggling against mortal disease. On the 8th March 1826, he appeared at Covent Garden Theatre as conductor of a selection from *Freischütz*; and on the 12th of April following he also conducted, on the first appearance of *Oberon*, with applause on both occasions, incessant and uproarious. At his benefit concert on the 26th of May, he was hardly able to go through the duty of conductor; and on the 5th of June he was found dead in bed in the house of Sir George Smart, whose guest he was. He was interred in the Roman Catholic Church, Moorfields; but in 1844, his body was removed to Dresden; and a statue of him by Reichel was erected in 1860 in front of the Dresden theatre. W. was married in 1818 to Carolina Brandt, an operatic singer of some note, daughter of Brandt the violinist, by whom he left a family.

The verdict of posterity, as well as of his contemporaries, has placed W. in the first rank of musical composers. He was the first to use those bold effects of harmony and modulation whose introduction forms an era in the history of music. In his operas, the spirit of the romantic school appears in its brightest and most captivating form; and the overtures are masterpieces of imagination, each presenting an outline of the work to which it belongs. Besides the above operas and songs, his musical

works are numerous, comprising concertos for the pianoforte, clarinet, oboe, bassoon, and violoncello—symphonies and overtures, one of the most beautiful and characteristic of them being the overture to the *Beherrscher der Geister*. Among his posthumous writings is an Autobiography. His Life has been written by his son, Baron Max Maria von Weber, and recently translated into English by Mr Palgrave Simson.

WEBSTER, DANIEL, American statesman and jurist, was born at Salisbury, New Hampshire, January 18, 1782, the second son of Ebenezer Webster, a small farmer, and justice of the county court. He entered Dartmouth College in 1797, and taught school in winter to pay his expenses, and aid his brother, Ezekiel, who became a distinguished lawyer, in fitting for college. On graduating in 1801, he commenced to study law, but was induced, by the offer of a salary of 350 dollars a year, to become preceptor of an academy at Fryburg, Maine, paying his board by copying deeds. In 1804, he went to Boston, and entered the law office of Mr Gore, refusing an appointment of clerk of the court of which his father was a judge, at 1500 dollars a year. In 1805, having been admitted to the Boston bar, he established himself at Portsmouth, New Hampshire; married in 1808; and having engaged in politics as a member of the Federalist party, was elected to Congress, where he immediately took rank with the foremost men of the country. His speech on the Berlin and Milan Decrees, and his mastery of the questions of currency and finance, gave him a high position; but he determined, in 1816, to remove to Boston, where, leaving politics, he engaged for several years in legal practice of the most extensive and varied character. In 1822, he was a member of the Massachusetts Constitutional Convention; and December 22, 1822, he pronounced at Plymouth, on the anniversary of the landing of the Pilgrims, the first of that remarkable series of discourses, or orations, which gave him the first rank among American orators. In 1825, he gave an oration at the laying of the corner-stone of the Bunker Hill Monument; in 1843, one on its completion. In 1826, he pronounced the eulogy of John Adams and Thomas Jefferson, two fathers and Presidents of the American republic, who died on the same semi-centenary anniversary of the Declaration of Independence; and in 1851, a patriotic discourse on the laying of the corner-stone for the extension of the Capitol at Washington. In 1822, he was elected to Congress from Boston, and was distinguished by his speeches on the Holy Alliance and the Greek revolution, and his labours in the revision of the criminal laws of the United States. In 1826, he was chosen senator; and in 1830, rose to the height of his forensic renown in a speech of two days, in the debate with Mr Hayne, of South Carolina, on the right of 'nullification.' W. and Clay were the leaders of the opposition during the administrations of Jackson and Van Buren. In 1839, he visited England, Scotland, and France; and in 1841, accepted the post of Secretary of State in the cabinet of General Harrison, and remained in that of Mr Tyler, who, as Vice-president, succeeded on the death of the President, until 1843. In 1844, he aspired to the presidency, but the choice of his party fell upon Mr Clay, whom he supported, but unsuccessfully. He was chosen senator for Massachusetts, and again, in 1848, was disappointed of the presidential nomination by the popular enthusiasm for the victor of Buena Vista, General Taylor. His senatorial efforts at this period were directed to the preservation of the Union by the advocacy of compromises on the slavery question, and he gave offence to the Abolitionists

by defending the Fugitive Slave Law. In 1850, he became again Secretary of State in the cabinet of Mr Fillmore; and in 1852 was once more, and no doubt grievously, disappointed at not receiving the nomination to the presidency, which was given to General Scott. He did not live to see the defeat of his rival; but, after a brief illness, died at his country residence at Marshfield, Massachusetts, October 24, 1852. Mr W. was a man of very striking appearance, large, swarthy, with deep-set eyes, a deep powerful voice, and a solemn and earnest manner. His collected writings and speeches have been published (6 vols. 8vo, 1851), and his Correspondence (2 vols. 8vo, 1855).

WEBSTER, NOAH, American author and philologist, was born at Hartford, Connecticut, October 16, 1758, and entered Yale College in 1774. In his third college year, he served under his father, a militia captain, in the war of the Revolution. He was admitted to the bar in 1781, but engaged in scholastic and literary occupations. Employed in teaching a school at Goshen, New York, he prepared his *Grammatical Institutes of the English Language*, published in three parts; and edited *Governor Winthrop's Journal*. In 1785, he wrote *Sketches of American Policy*, advocating the formation of a new constitution, and gave public lectures on the English language, which were published in 1789. He taught an academy in Philadelphia, and wrote on the Constitution; and in 1788, published the *American Magazine* in New York. After a few years' law-practice at Hartford, he engaged, in 1793, in the editorship of the *Minerva*, a Federalist daily paper in New York. In 1799, he published *A Brief History of Epidemic and Pestilential Diseases*, the yellow fever having broken out in New York; and pamphlets on International Law, Banking, and Finance. In 1807, he published *A Philosophical and Practical Grammar of the English Language*, and commenced his *American Dictionary of the English Language*; but finding difficulties in etymology, he devoted ten years to its study, and prepared a *Synopsis of Words in Twenty Languages*; then began his Dictionary anew, and in seven years completed it. In 1824, he came to Europe, to consult books and learned men, spending some months at Paris and at Cambridge. In 1828, an edition of 2500 copies of his Dictionary, in 2 vols. 4to, was issued; followed by one of 3000 copies in England. Numerous abridgments have been made, which found a large sale. His *Elementary Spelling-book*, founded on his *Institutes*, up to 1862, had been sold to the extent of 41,000,000 copies. A new and thoroughly revised and enlarged edition of his dictionary was finished in 1866, and it is now perhaps the most complete dictionary of the English language yet published. Mr W. also published a popular *History of the United States*, and a *Manual of Useful Studies*. He was a judge, a member of the state legislature, and one of the founders of Amherst College. He died at New Haven, May 28, 1843.

WEDGE, one of the mechanical powers, and in principle a modification of the inclined plane. Its normal form is here represented. The power is applied by pressure, or more generally by percussion, to the back B, thus forcing the edge A forwards. The wedge is employed for such purposes as the splitting of wood, the fastening firmly of the handle of an axe, the raising of a ship in a dry dock, &c. The investigation on statical principles of the mechanical advantage of the wedge is extremely unsatisfactory, the power, which is scarcely

ever a 'pressure,' being always assumed to be one, and the enormous friction on the sides of the wedge being generally neglected; the theoretical result thus arrived at is that the pressure applied at the back: the resistance or weight :: $\frac{1}{2}$ width of back of wedge: length of side. In the application of the wedge to the splitting of wood in the direction of the fibres, the split generally extends some distance in advance of the edge of the wedge, and the action of the latter is then a combination of the action of the wedge with that of the lever; in fact, this compound action is found more or less in all applications of the wedge as a cutting or splitting weapon, and tends further to complicate the statical investigation of its mechanical properties. The best and simplest illustrations of the single wedge are axes, nails, plugs, planes, chisels, needles, and all sharp-pointed instruments.

WEDGWOOD, JOSIAH, the creator of British pottery as an art, was born at Burslem, in Staffordshire, in the year 1730. His father was a potter, and very early he was set to work at the same business. His education seems to have been of the scantiest. After an abortive attempt to settle himself at Stoke with a partner named Harrison, he returned to his native place, and there commenced business as a potter. From the first, his ardour for the improvement of the manufacture was conspicuous. His first efforts were directed to the refining of the material, and soon he succeeded in producing a beautiful cream-coloured porcelain, which became popularly known as Queen's Ware, Queen Charlotte having much admired it, and extended her patronage to the manufacturer. Subsequently, other improved materials were produced. The attention of W. was not less assiduously directed to considerations of form and decoration; he busied himself in emulating the grace of the antique models; and the celebrated sculptor, Flaxman, was employed to furnish designs to him. In this way, what he found a rude and barbarous manufacture, he raised to the level of a fine art; and he found his reward in the speedy amassing of an immense fortune. In 1771, he removed his works some little way from Burslem; and to the new site he gave the fanciful name Etruria, as that of the country of old most celebrated for the beauty of its ceramic products. Here he built himself a splendid mansion; and here, in 1795, he died.

Apart from his eminence in the art to which he mainly devoted himself, W. was a man of considerable culture. Natural philosophy, in particular, he studied with much success. He was a fellow of the Royal Society, as also of the Society of Antiquaries; and to the *Philosophical Transactions* he from time to time contributed papers. He likewise interested himself deeply in all matters of public concernment; and mainly through his influence it was that the Grand Trunk Canal, uniting the waters of the Mersey, the Trent, and the Severn, was carried out. He was a man of much benevolence of character, and the prosperity which flowed upon him through life, he distinguished by the exercise of an almost princely liberality.

Full particulars as regards this remarkable man may be found in two lives of him recently published, the one, in 1865, by Eliza Meteyard (2 vols. Hurst and Blackett), the other, in the same year, by Llewellyn Jewett (Virtue and Co.).

WEDGWOOD WARE, a beautiful kind of pottery invented by Josiah Wedgwood in 1775. It consists of flint, Potter's clay, carbonate and sulphate of barytes, and zaffre, or some other colouring material. It is also called Jasper Ware. The beautiful classical designs on the earliest productions

of this manufacture were many of them executed by Flaxman, and are very highly valued.

WEDNESBURY, a market-town in the south of Staffordshire, in a district abounding in canals, coal mines, and iron-works, $7\frac{1}{2}$ miles north-west of Birmingham by railway. It was called Weadesbury by the Saxons, and for a long time took precedence, in point of population and historical importance, of Birmingham and Wolverhampton. It was here that the great coal-field of Staffordshire was first worked. The parish now contains probably the largest works in the kingdom for the manufacture of railway plant; and of its productions, iron, wheels, axles, tubes, edge-tools, coach ironmongery, locks, screws, &c., are prepared extensively for exportation. The pop., which in 1821 was under 7000, had in 1851 risen to about 12,000 in the town, and 14,300 in the parish; in 1861 the town had 15,298, and the parish 22,000; and in 1867, the pop. of the parish was estimated at 26,500.

WEDNESDAY, the fourth day of the week, the *Dies Mercurii* of the Romans, the *Mittwoch* (mid-week) of the modern Germans. The name Wednesday is derived from the northern mythology, and signifies Woden's or Odin's day. The Anglo-Saxon form was *Wōdanes dag*, the old German *Wuotanes tac*. The Swedish and Danish is *Onsdag*.

WEE'BO, or **IBO**, a small island off the coast of Mozambique, belonging to the Portuguese, about 150 miles south of Cape Delgado. The town is clean, with neatly-built houses; there are three forts, one of which serves as barracks for the garrison, and, though contemptible as a defensive work against a well-organised enemy, it is well adapted for resisting the natives, between whom and the Portuguese all along the Mozambique coast, there seems to be perpetual hostility. The pop. consists of nearly 3000 natives and a few Europeans; and though an important trade in ivory, copal, &c., is said to be carried on, there are few signs of activity in the harbour, and the natives for the most part seem miserable, fever-stricken wretches.

WEED, **THURLOW**, American journalist, was born at Cairo, New York, November 15, 1797, and at the age of 10 years was cabin-boy on a sloop on the Hudson River; at 12 he was an apprentice in the printing-office of Mr Crowell, at Catskill; then lived for a short time in a backwoods settlement, but at 14 returned to printing. He was a volunteer in the war of 1812, and at the age of 21 established a newspaper in Western New York, and during the Anti-Masonic excitement, was elected to the state legislature, 1826—1827, where his peculiar and almost unrivalled abilities as a political manager or 'wire-puller' were early recognised. In 1830 he settled at Albany, the state capital, and commenced the publication of the *Evening Journal*, an anti-Jackson, whig, or republican paper, which became the organ of the party, and of the state government when its party was in power. Declining all offices for himself, except the profitable one of state printer, he is supposed to have exercised almost supreme influence in nominations and appointments, and to have secured the choice of Presidents Harrison and Taylor; has been, through his whole career, the friend and adviser of Mr Seward. In 1861, he was sent in a semi-diplomatic capacity to Europe, and on his return, was presented by the authorities of New York with the freedom of the city, where he became part proprietor and one of the editors of the *New York Times*, in which he has advocated a prudent and conservative policy.

WEED (*Lymphangitis*), or a Shot of Grease, consists in inflammation of the large absorbent glands

and vessels situated between the horse's thighs. Rarely, it attacks the corresponding structures between the fore-limbs. It occurs in round-limbed, indifferently bred, hard-wrought horses; appears particularly after a day or two of rest, after exposure to cold, or during imperfect action of the bowels; and is said to depend upon more blood being produced than is required to replace the natural waste of the body. It is identified by lameness, tenderness in the groin, and fever. The horse must be bled, have a full dose of aloes, and when the pain and tenderness are great, ten drops of Fleming's Tincture of Aconite in water every two hours; the limb should be bathed for at least six or eight hours continuously in hot water, and then rubbed dry and kept warm. The subsequent swelling will be reduced by saline draughts, diuretics, rubbing of the limb, and exercise.

WEEDS, the name given to all those plants which grow wild in cultivated grounds, and injure the crops; which they do both by choking them, and by exhausting the soil. Those weeds which are annuals or biennials, as charlock, yellow rattle, and melilot, may gradually be got quit of by merely cultivating, for a succession of years, such plants as are to be cut before the seeds of the weeds are fully ripe. Perennial weeds, such as couch grass, can only be removed from the ground by repeated and careful tilling; and for this purpose, crops which require much hoeing are advantageously planted, and recourse is had to summer fallowing in fields, and frequent weeding in gardens. Thistles and other large weeds are frequently pulled in corn-fields before the corn comes into ear, and to prevent their seeding, they are cut in pastures. Sedges and rushes, which spring up in great abundance in damp grounds, disappear on thorough draining. Leafy crops which thickly cover the soil, prevent the growth of many weeds by the exclusion of air and light. Weeds which have been rooted up form excellent compost for manure. Those which make their appearance in fallow grounds, serve for green manuring when they are ploughed down.

WEEK (Goth. *Vico*; Old High-German, *Wekha* = order, cycle (?); Lat. *Vicis*; Gr. *Hebdomas*, *Sabbaton*; Heb. *Shabna*, from *Sheba*, seven) designates generally a period of seven days. It was probably first instituted as a kind of broad subdivision of the periodical month, corresponding to the four quarters of the moon, or about $7\frac{1}{2}$ days. Although found as a civil institution among some nations at the earliest time—e.g., with the Hindus, Assyrians, Persians, &c., it is only with the Jews that we see a religious signification given to the concluding or seventh day of that period itself. Both their cosmogony and legislation are connected with it. The Sabbath (q. v.) is emphatically the day of rest, while seven weeks after the Passover, the Pentecost or Feast of Weeks takes place, &c. (see SEVEN). It is doubtful whether it was through the Jews that this computation of weeks was introduced to the Egyptians, but it is certain that the latter at an early period counted seven periodical days, naming them according to the seven planets then assumed. The application of the names of the planets to the days of the week in the order they now stand, originated in this way: It was an astrological notion that each planet in order presided over an hour of the day, the order, according to their distances from the earth, being, on the geocentric system, Saturn, Jupiter, Mars, the sun, Venus, Mercury, the moon. Assuming Saturn to preside over the first hour of Saturday, and assigning to each succeeding hour a planet in order, the 22d hour will fall again to Saturn, the 23d to Jupiter, the 24th to Mars, and the

first hour of the next day to the sun; in the same way, the first hour of the following day falls to the moon, and so on. From Alexandria, this seven days' week was imported, together with the names of the individual days, to the Greeks—who previously divided their months into three decades—and to the Romans, about the time of Christ. Rome had previously counted her periods by eight days, the eighth day itself being originally called *Nundina*—a term later applied to the whole cycle—as returning *novo quoque die*, when the country-people were in the habit of coming to town for the purposes of business, and chiefly to inquire after public news, the changes in government and legislation, vacant places, and the rest. But the seven days' cycle soon found great favour among the Romans, owing partly, perhaps, to the spread of Egyptian astrology, although the change was not officially introduced before Constantine. It is certain that the Jewish name Sabbath came into use in Rome, and from Rome it spread to all the Romanic languages, even into the German. It survives in the Italian *Sabbato*, the Spanish *Sábado*, the French *Samedi* (*Sabbati dies*), and the German *Sambazac*, which afterwards became *Samstag*. In the same manner, the Latin *Septimana* (the Greek *hebdomas*) has become the modern designation for week in the Italian *Settimana*, Span. *Semana*, French *Semaine*, and even in the Irish *Sechtmaine*. The *Codex Theodosianus* is the first document which adopts the term *Septimana* in the meaning of weeks. The Jews, as well as the early Christians, had no special names for the single days, but counted their number from the previous Sabbath, beginning with Sunday, as the first after the Sabbath, and ending with Friday, as the sixth after the previous, or eve (*Ereb*) of the next Sabbath. After a very short time, however, young Christianity, which in the same manner had endeavoured to count from the *feria secunda*, or second day after Sunday, to the *Septima* (or Saturday), had to fall back again upon the old heathen names, previously introduced in Gaul, Germany, &c. by the heathen Romans. The Sunday, or *dies Solis*, alone was changed in many of the Romanic languages in accordance with the new creed. It was called *Kyriake*, *dies Dominicus* or *Dominica*, the Day of the Lord, a term which in Italian became *Domenica*, in Spanish *Domingo*, and *Dimanche* in French. The Germanic *Froniac* (from *frón* = *dominicus*) occurs but once. It is very curious to notice how the names of the five days of the week which followed those named after the sun and moon, became Germanised, as it were, or the names of the originally imported gods translated into those of the Germanic divinities. Thus, the day of Mars became that of Ziu (see *TRR*). Mercury became Wodan; and the fourth day was called after the latter, in Dutch, English, and Scandinavian; while in Germany it was simply called the middle of the week = *Mittwoch*. The day of Jupiter became the day of Thor = Thursday, *Donnerstag*; while the *Dies Veneris* was transformed into the day of Freya, the wife of Odin (Wodan). The day of Saturnus, retained under this name in some northern tongues, became a *langardage*, or bathing-day, in others; while in Upper Germany it remained a Sunday-eve (*feria ante dominicam*) or *Samstag* (see above). Among the Semitic nations, which, as far as our information goes, seem to have had the computation by weeks at the earliest period, the Arabs stand foremost; and up to this day they count their days by seven, beginning and ending with the sunset previous to each new day, and they count them instead of giving them special names—except the Friday, which is called the Day of Assembly (*Yaum Al-Djuma*),

or Aruba (= Heb. *Ereb*) Eve (of the Jewish Sabbath). Slavonians, Lithuanians, and Finns also count their days from Sunday, instead of giving them planetary names. The French Revolution altered the seven days' week into a decade of ten days, but the new computation introduced in 1793 was abrogated again in 1805. Respecting the 'weeks of years' (very similar to the Roman *annorum hebdomadae*), it will suffice here to indicate that they only occur in prophetic poetry, and seem to indicate there certain seven years' cycles. For further information on this subject, we refer principally to Ideler's *Chronologie*.

WEEKS, FEAST OF (Gr. *Pentecoste* = fiftieth, Heb. *Shabuoth*, also called Feast of Harvest, Day of the First-fruits, &c.), the second of the three great *Regalim* or Pilgrim Feasts of the Old Testament, was celebrated seven weeks, or forty-nine days, after the Passover. As the latter was the feast of the barley harvest, so the former was that of the wheat-harvest. The first two loaves of the new crop were offered up on the day of the festival—leavened, and containing about $3\frac{1}{2}$ quarts each (the Mishnah speaks of their being 7 inches by 3), together with a peace-offering of two lambs. Besides this, a great burnt and sin offering—the former consisting of seven lambs, a bullock, two rams, together with the appropriate meat and drink offerings; the latter of one kid—were added, according to Leviticus (xxiii. 18); while Numbers (xviii. 27) increases the number of the bullocks to two, and only mentions one ram—a number more in accordance with the regulations for the other festive sacrifices. The Jewish tradition, however, considers the animals mentioned in the later passage as an additional sacrifice; and Josephus has indeed added both up, except in as far as the rams are concerned, of which he only gives two. Tradition has given to this feast, which originally was only intended to represent the solemn closing of the harvest, a new significance by making it the anniversary of the Sinaitic Legislation, which indeed must have taken place in the first days of the third month. But the Pentecost, which is always fixed in the Jewish calendar on the 6th of Sivan, could not, before the establishment of astronomical computation, fall always on the same day, but must needs have fallen between the 5th and 7th of that month. Moses himself nowhere fixes the date of this festival as he does with the others. The Karaites, instead of referring the 'morning of [after] the Sabbath' of Lev. (xxiii. 15) to the 16th of Nisan, take it literally, and celebrate the festival always on a Sabbath. The uncertainty of the lunar calculation and observation among the Jews of the Dispersion, caused them also to add one day to this festival—a usage still retained at present. There seems to have been more of the character of a harvest-home inherent in this festival than in the Passover, which partook particularly of the character of a large and solemn family-gathering. For the Christian adoption of this festival, see *FEASTS*.

WEEPING TREES are trees with remarkably elongated and pendulous branchlets, generally mere varieties of species which ordinarily have a different habit, as the Weeping Birch, Weeping Ash, and Weeping Willow, which are varieties of the Common Birch, Common Ash, and White or Huntingdon Willow. The Weeping Birch occurs in a wild state in some places in the Highlands of Scotland, and is a characteristic ornament of the landscape. Trees intermediate in their habit between the Weeping Birch and the common variety are of very frequent occurrence. Weeping trees are much esteemed for ornamental purposes, and are not only very beautiful

WEERT—WEEVER.

in themselves, but as a contrast to other trees in lawns and pleasure-grounds. They are therefore

Weeping Willow.

carefully propagated in nurseries. The Weeping Ash is often grafted on the Common Ash, but the

Weeping Birch.

result is seldom very satisfactory, the art of the gardener forcing itself too much upon attention. A

tendency to the weeping habit of elongated and pendulous branchlets is manifested in some kinds of trees, as the tendency to vary into a very opposite habit, with the branchlets drawn up close together (var. *stricta* of botanists), appears in others, of which the Swedish Juniper and the Irish Yew are familiar examples.

WEERT, an unwall'd town in the Netherlands, province of Limburg, 12 miles west-north-west of Roermond, on the ship-canal from Maastricht to 's Hertogenbosch. Pop. 6788. There are several good schools, a collegiate institution, town-house, two churches, and three market-places. In the Church of St Martin is the grave of the Count of Hoorn, who was beheaded at Brussels, in 1668, for adhering to the Prince of Orange in the struggle for religious and political freedom. A beautiful promenade leads to the other church, outside the town, north of which are the ruins of the old castle. Besides the markets for farm produce, horses, and pigs, W. has factories for making cloth, stockings, and hats, corn and oil mills. Here was born, 1694, Jan van Weert, who, in boyhood a shoemaker's apprentice, became commander of the Austrian army and viceroy of Bohemia.

WEEVER, or STING-FISH (*Trachinus*), a genus of acanthopterous fishes of the family *Uranoscopida*, also called *Trachinida*. In this family the ventrals are composed of a spine and five jointed rays, and are generally situated before the pectorals. The scales are cycloid, or wanting. The eyeballs

Greater Weever (*Trachinus draco*).

are capable of being raised in a remarkable manner out of their sockets, and of being retracted again to the level of the orbits. The species frequent the bottom of the sea. They are often furnished with barbels, and have also a peculiar membranous filament under the tongue, which they can protrude at pleasure. In the genus *Trachinus* the head is compressed, the eyes are placed high and close together; there is a long sharp spine on the hinder part of the gill-cover. There are two dorsal fins; the second dorsal and the anal are long; the ventrals are close to the throat. Two species are found on the British coasts, the GREATER W. or STING-BULL (*T. draco*), and the LITTLE W. or VIPER W. (*T. vipera*). The former attains a length of nearly one foot; the latter, seldom of more than four or five inches. The general form is long, narrow, and compressed; the Little W. is proportionally deeper in body than the Greater Weever. The head of both is short, compressed, flat between the eyes, and rough on the summit; both dorsals and the anal fins are spiny; and in both the gill-cover is furnished with a strong and sharp spine, which is directed backward, and can be appressed to the body, but which is also capable of being made to stand out so as to present its point to an adversary. Both species are of a yellowish brown colour. They inhabit parts of the sea having a sandy bottom, and often partially bury themselves in the sand, but are ready to move off with great celerity if disturbed. They can live long out of the water; and if left by the retiring tide, suffer no

inconvenience. If assailed, they can, by a sudden bending of the body, make use of one of the strong spines of the gill-covers against the assailant; and the wound thus inflicted is so severe, as to lead to the opinion that the spine is coated with a venomous exudation. Naturalists, however, generally supposed the popular opinion to be erroneous, and the severity of the wound to be merely owing to the laceration effected by the spine, until it was discovered by Dr Günther, in 1864, that poison-glands existed in connection with spines of some South American fishes of the family *Siluridae*. A peculiar stinging sensation attends a wound by a spine of a W., which extends far up the arm, if the wound has merely been in a finger, and is much more severe than the pain of a wasp sting. There is also a groove in the spine, which has perhaps something to do with the conveyance of the poison; but no poison-gland has yet been proved to exist. In France, the fishermen are required, under a penalty, to cut off the spines of weavers before selling them. Weavers are esteemed for the table.

WEEVIL (*Curculio*), a Linnaean genus of insects, now forming the tribe *Rhynchophora*, of the order *Coleoptera*, and section *Tetramera*. They are remarkably characterised by the prolongation of the head into a beak or snout, at the extremity of which the mouth is placed, and from which the club-shaped antennæ spring. Some of them have straight antennæ; but the greater number have the antennæ *geniculated*, or bent forwards at the second joint. The species are very numerous, and are distributed over all parts of the world. They all feed on vegetable food, both in their larval and in their perfect state; and some of them are notable for the mischief which they do in the former state, to the young shoots, leaves, fruits, and seeds of plants. They are diurnal insects, many of them very small, but others of considerable size. They are slow, timid, and defenceless; although the long hard beak suggests to those ignorant of its real nature and of their habits an idea of danger in handling the larger species. Many of them are of very dull and uniform colour; but some are amongst the most beautiful of the *Coleoptera*—resplendent with the finest hues, and brilliant as gems. Such is the well-known Diamond Beetle (q. v.) of South America. The larvæ of weevils are soft, white, and footless, with very convex rings, hard heads, and horny jaws. The perfect insects are often found on leaves and in flowers of the particular kinds of plants on which they and their larvæ feed. *Rhynchites betuleti*, a W. often very injurious to vineyards, constructs a nest for its larvæ by rolling up the leaf of the vine, piercing the roll as it proceeds, and depositing eggs between the folds in the inner part of the roll. The larvæ feed upon the leaf, which the parents further adapt for their use by cutting the leaf-stalk half through, so that the leaf hangs down, and by the time they are ready to change into the chrysalis state, it drops off, or is blown off by the wind, when they bury themselves in the ground to wait for the return of spring. Other trees, as the pear-tree, are infested by weevils which destroy their leaves in a similar manner; the leaves of some, as of the peach, often suffer injury from weevils which devour them, like caterpillars, without rolling them up; and turnips are subject to the ravages of certain small species of W., which proceed in the same manner. Some species of W. gnaw young shoots. The shoots of fruit trees, and young grafts, are sometimes destroyed by weevils, which bore into them by means of their beak, and make a small chamber in the centre, in which an egg is deposited, being pushed into its proper place by the beak.

The shoot is then cut through a little lower down, and the parent W. may be seen climbing upon it, when the operation is nearly completed, to make it fall by her weight, and returning again to her work, if it is not yet ready to fall. She lays about two eggs a day, but continues her operations for many weeks, so that much destruction is effected. The larva feeds on the pith of the fallen shoot, and deserts it when ready to become a chrysalis, to bury itself in the ground.—The larva of a large species of W. (*Calandra palmarum*) inhabits palm-trees in South America, feeding on their central part, and is eaten and esteemed as a delicacy. When roasted, it almost melts into grease; but its flavour is said to be remarkably fine. This W. is black; about an inch and a half long; its larva is between two and three inches long. Another species (*Calandra sacchari*) is very destructive to the sugar-cane. Its larva is also eaten in the West Indies and Guiana.—The wood of pines and firs is the food of certain kinds of W., so that plantations suffer severely from their ravages. Thousands of acres of pines in the Southern States of America have been destroyed by a W. (*Hylobius pales*), not much more than a quarter of an inch in length; and some of its congeners in other countries are scarcely less destructive, as *Hylobius abietis* in Europe.—There are many species of W. which attack leaf-buds and flower-buds. Thus *Anthonomus pomorum* infests the apple-tree, depositing its eggs in the flower-buds, and cutting off the prospect of fruit. *Anthonomus pyri* is equally injurious to the buds of pear-trees. Some species of *Rhynchites* lay their eggs in fruits—as apples and plums—at an early stage of their growth, cutting the fruit-stalk, that the fruit may fall to the ground. The European Nut-W. (*Balaninus nucum*) lays its eggs in young hazel-nuts, upon which the larvæ feed as the nuts grow; a nearly allied species attacks, in like manner, the hazel-nuts of America, and another infests acorns. The Pea-W. (q. v.) feeds upon peas; and other leguminous plants have their peculiar species, which devour their seeds. The Corn-W. (q. v.) is very destructive to wheat, and other similar species to maize, rice, and other kinds of grain.

WEFT, or WOOFF, the thread which, in weaving, is passed by the shuttle backwards and forwards through the warp. See WEAVING.

WEIGHING-MACHINES are of various forms, according to the quantity and species of the goods whose weight is to be determined. The great majority of weighing-machines are founded upon the principle of the Lever (q. v.), the only exceptions being the various forms of the Spring-balance (q. v.), to which might be added (though in such cases the term 'machine' is quite inapplicable) some of the methods employed to determine specific gravity, time of oscillation, &c. The simplest and primitive form of weighing-machine is the Balance (q. v.) with equal arms, which can be adapted either to the maximum of accurate weighing or to the most rapid equiponderance. But as this machine necessitates the placing in one scale of weights equal to the weight of the goods, it was soon found to be more convenient to employ a lever with unequal arms—the goods to be placed in the scale attached to the short arm, and therefore equipoised by less weights, the ratio of the weights in the two scales being in proportion to the ratio of length of the arms. On this principle the *steelyard* (see BALANCE), the *bent lever balance* (see BALANCE), and the *cart-steelyard* are constructed. But the convenience of equipoising a greater weight by one much less is counterbalanced by a considerable diminution in accuracy—one of the causes of error being the

greater liability to flexure of the longer arm of the lever; and another, the necessity, for convenience' sake, of having the arm which is affected by the goods to be weighed as short as possible—the latter of itself reducing the accuracy of the steelyard to that of a symmetrical balance whose arms are each equal to the short arm of the steelyard. However, on behalf of the steelyard, there is again the advantage of rapid equipoise. Each of these machines is variously constructed, the modifications having reference either to convenience of use, or to the species or weight of the goods to be weighed: an example of the former is the equal-armed balance (fig. 1), made

Fig. 1.

in an inverted manner, with the scales above, and the rods which connect the scales with the beam so united as to preserve their perpendicularity during oscillation; and the latter is appropriately illustrated by the form of cart-steelyard given in fig. 2. The dotted lines, DD, DD, indicate the grooved plates on which the wheels rest; E, E, E, E are the four points supporting the wheel-plates on the two triangular levers, CBB, CBB; the triangular levers

Fig. 2.

are supported by the hooked extremities of their bases, B, B, B, B, upon fixed supports, A, A, A, A; while their vertices, C, C, are attached to a lever, FG, whose fulcrum is at F; G is attached by a chain to H, the extremity of a lever of the first kind, whose fixed support is at K, and on whose other arm (graduated) the weights for equipoising the cart and its load are placed. The machine is thus seen to be compound, consisting of the two triangular lever pieces, of a simple lever of the second, and of one of the first kind; the weight L, if sufficient, raising H, and with it G, and thence raising C, and so balancing the downward pressure of the cart and its load at E, E, E, E. Various other forms of the cart-steelyard are in common use, most of them more complicated in construction and less accurate.

WEIGHTS AND MEASURES. For the proper carrying on of mercantile transactions, and for many other purposes, it is necessary that there be fixed and readily-accessible standards of magnitude, of weight, and of value. The lengths implied by the names *a foot, a hand, a cubit, a fathom*, are far too indefinite to have long continued to satisfy the wants of civilised nations; and in every country, by common consent, or by the action of government, determinate measures have been agreed upon. These measures, left almost to chance, have been different from one nation to another, even from county to

county, sometimes from town to town, and still more awkwardly, often from one trade or guild to another.

Any one can appreciate the inconvenience of such a want of uniformity, for, in every transaction extending beyond his own sphere, he has to take account of the change of measure, the change of weight, the change of money, perhaps of all three at once. We all see and allow that there ought to be only one system of weights and measures in one country; that one bushel in Winchester, another in York—one acre in England, another in Scotland, and a third in Ireland; that Troy weights, avoirdupois weights, apothecary weights, and all the other local, conventional, and trade variations which abound in the British dominions, form an aggregate of unbearable confusion, leading to endless mistakes and ceaseless quarrels. It is not more difficult to perceive that if one system be advisable for one country, a universal cosmopolitan system would be no less advantageous for the whole world.

The only practicable method of establishing a system of measures is to construct standards of reference, and to preserve these carefully in some public place. In order that these standards may not be worn and injured by too frequent use, it is convenient to have authenticated copies deposited in the various towns, so that all dealers and artificers may have ready access to them, and so that all makers of weights and measures may be without excuse for errors in their workmanship.

To set up a standard of measure seems to be a very simple matter—the authorities have only to fix upon the proper length of a yard, to have a piece of wood or of metal made to that length, and to cause it to be properly marked and preserved. For common purposes, this seems to be quite enough: however, experience soon shews the inconvenience of this simple plan, for, by repeated contacts, the ends of the yard-measure get worn. Instead, therefore, of making a rod just a yard long, they make it a little longer, and upon it form two fine marks a yard distant from each other, and hold this distance to be the true standard. By this expedient, the effects of wearing are got rid of; copy after copy can be compared with the original, without deterioration of the standard.

But use is not the only cause of deterioration: wood decays or is worm-eaten, and metals are liable to oxidation, so that the material has to be carefully chosen. This is not all. Every substance which has been examined is found to change its size with a change of temperature; the standard bar is shorter in winter than in summer; and the change, though it be so small as to be of no moment to the haberdasher, the wright, or the mason, is enough to cause great trouble to those engaged in very accurate work. Hence, in the selection of the substance to be used for the standard bar, we must have an eye to smallness of expansion as well as to durability. The substances available, taken in the order of their expansibility, are—*deal, glass, platinum, gold, silver, iron, brass, copper*. Deal may be put aside as wanting in durability, and the choice may be said to lie between glass and platinum, neither of which is much acted on by the air, or by the vapours which are found in the atmospheres of large towns. The fragility of glass and the costliness of platinum are objections; but the latter is a mere trifle when a national standard is concerned. Platinum, then, seems to be the best substance.

The standard measure for the British Empire is a brass rod, into which two pins of gold are inserted; these are dressed flat with the surface of the bar, and a small dot is made in the middle of each. The

WEIGHTS AND MEASURES.

distance between the centres of these dots, taken when the temperature is at 62° F., is declared to be the true yard.

In the same way as the standard of measure, so must the standard of weight be established. A piece of heavy metal is made of the desired weight, and is duly authenticated. The preservation of the standard of weight is a matter of very considerable difficulty. Every occasion on which it is used, each removal of dust from its surface, the actions of the oxygen of the air and of the products of combustion which are always floating about, produce a sure though slow waste; and all that can be done is to retard this waste as much as possible. Perhaps a lump of platinum would make the best standard; but its softness is a decided objection.

In the use of a standard of weight, another matter has to be taken into consideration. The apparent weight of any substance is less than its true weight by the weight of as much air as is displaced by it. Now, the density of the air is not constant—air, when warmed, expands very much more than any solid body; and therefore a piece of metal appears to weigh more in warm than in cold weather. Not only so, air is rendered more dense by an increase of pressure, and so, when the barometer is high, all heavy bodies become apparently lighter; when the barometer sinks, they appear to become heavier. Thus the apparent weight of the standard pound is continually changing. If we accurately adjust two weights of brass when the barometer is low and the air warm, and afterwards compare them when the barometer is high and the weather cold, we can perceive no change, for, though each has lost weight, they have lost alike. But if we had adjusted a weight of iron to a weight of platinum in light air, and again compared them in dense air, the change would have been at once seen. For, since a pound of iron is more bulky than a pound of platinum, it displaces more air, and its apparent weight undergoes a greater change than does that of the platinum. Fortunately, these changes are too small to have any perceptible influence on mercantile transactions, yet they are sufficient to create the necessity for it being enacted that the standard weight must be held as true when the air is in a specified state as to warmth and pressure. The standard brass pound, which serves for the British Empire, is directed to be used when Fahrenheit's thermometer is at 62°, and when the barometer is at 30 inches.

The thought naturally arises, what if, in the course of time, the original standards be lost or destroyed?

Time was when a seed of wheat gathered from a well-ripened ear served sufficiently well to define a grain weight; and even now the Eastern jewellers weigh their gems against the *carat* or carob-bean, the hardness and uniformity of which seem to justify the selection of it. But for the extended purposes of modern commerce, and particularly for the more delicate requirements of scientific research, it is indispensable that we find some unchanging object of comparison; and none can be preferred to the earth itself, as the most universally acceptable and as the best defined. For the purposes of geographers and navigators, the circumference of the earth is divided into degrees and minutes, the length of one minute being the geographical or nautical mile; and it certainly would have been convenient if the common or statute mile had agreed with this. The dimensions of the earth are now known with a precision far greater than is needed for ordinary purposes; the entire length of the circumference of a meridian circle being 131,236,000 of our standard feet, so that the length of a nautical mile is 6075

feet and about 9 inches; and it is highly probable that subsequent and more accurate measurements will not alter this determination more than an inch or two either way. It is usual to divide the minute into 60 seconds, so that a second of the earth's circumference is 101.25, and thus if our standard foot had happened to be one-eightieth part longer than it is, there would have been exactly 100 feet in a second, and 6000 feet in a nautical mile. When we reflect on the disparity of the foot used by different nations, and recollect that 100 Vienna feet make 103.6 English, as many Amsterdam feet 92.7, as many Berlin feet 99.2, we can hardly help regretting that our forefathers had not happened to hit upon the exact 100.

The ancient Greeks were fond of dividing into sixties; this division still continues in our scales for angles and for time; and it is worthy of remark, that if we divide the whole circumference of the earth into 60 parts, each of these into 60, and again each into 60, we arrive at a distance of 607.5 English feet. Now, the length of the ancient Greek stadium or furlong is stated to be 606½ feet by some writers; and if deduced from measures of the Roman mile, is between 605 and 613 feet; so that if we desire a cosmopolitan standard, we can hardly do better than go back to the ancient Greek *stadion* or the Chinese *li*, corrected to suit the more accurate determination of modern times: this would bring us to the geographical foot, one-hundredth part of a second of the earth's meridian.

The standard of weight is readily connected with the standard of measure. Some substance which can be easily obtained pure is chosen, and a definite bulk of it is weighed. Distilled water is universally selected for this purpose; and in the British system, the weight of one cubic inch of pure water is declared to be 252.458 grains when it is at the temperature of 62° F.

It has long been known that water does not continue to contract as it is cooled; the contraction becomes less and less as the temperature approaches to 41° or 39° F.; and the water, when cooled more, begins to expand, and continues to grow more bulky until it be on the point of freezing. On this account it has been proposed, and without any doubt it would be the best plan, to take water when at its greatest density as the standard for comparison, because then an error of a degree in temperature will produce no perceptible error in the weight.

The operation of verifying the standard of measure by comparing it with the size of the earth is necessarily an expensive and a complicated one, only to be attempted under the auspices of a wealthy government, or with the concurrence of several nations; and it is desirable to find out something more local and more easily obtained wherewith to compare our measures. The length of the Pendulum (q. v.) has been proposed; and, on account of a very simple and beautiful property of pendulums, the comparison can be readily made. If we imagine an excessively minute heavy body to be suspended by a thread so fine that the weight of the thread may be neglected, the compound so formed is called a simple pendulum; and the question becomes, what must be the length of such a pendulum in order that it may vibrate from side to side in, say, one second of time. Now, it is clear that we cannot obtain this length by direct experiment, since we cannot construct such a pendulum. M. Biot tried to approximate to it by using a small ball of platinum hung by a very fine wire. However it is known that if a heavy rigid mass, AB, be suspended by a knife-edge C, and if its vibrations be made in the same time with those of a simple pendulum of which the length is CD, then if we place another knife-edge

WEIGHTS AND MEASURES.

at D, and reverse the ends A, B, the compound pendulum will again vibrate in the same time as before. Hence, we have a very simple method of comparison. Having constructed a strong bar with two knife-edges at a known distance from each other, say at the distance of a yard; let us then by many trials, filings, and scrapings, so adjust it as that the times of vibration shall be alike for the two knife-edges, and, finally, let us count how many vibrations such a pendulum makes per day, and then we shall have a means of verifying our measure.

The act of parliament which fixes our present weights and measures, enacts that the length of a pendulum vibrating in one second of mean solar time is 39.13929 inches: now the lengths of pendulums are proportional, not to the times in which they vibrate, but to the squares of those times; and so, if we know the length of one pendulum, and the number of vibrations it makes per day, we can calculate what ought to be the length of another to vibrate a given number of times. A convertible pendulum having the distance between its knife-edges exactly 36 inches, ought to make 90088.42 vibrations per day.

When only a degree of accuracy sufficient for commercial and ordinary purposes is aimed at, the above process is by no means difficult; but when extreme precision is wanted, the operation is attended with many and very great difficulties; it involves considerations which would hardly have been expected. In the first place, our experiments are made in air, and the buoyancy of the air lessens the actual weight of the pendulum; that buoyancy has to be allowed for, and therefore it is declared that the above length is that of a pendulum vibrating in a vacuum. Next, since the earth has a diurnal motion on its axis, every substance placed on it has a centrifugal tendency which goes to modify what otherwise would have been its gravitation; this centrifugal tendency produces the earth's oblateness, and causes a variation in the intensity of gravitation from one latitude to another. A stone is actually heavier in Edinburgh than it is in London. This change in gravitation cannot be measured by a balance, because the weights at each end of the balance are changed alike; but it is seen at once in the going of a clock; for a pendulum regulated to go truly in London is found to go too fast when taken to a higher latitude, and to lose time when carried nearer to the equator. Hence, the enactment that the pendulum must be swung in the latitude of London. And again, the attraction which the earth exerts upon bodies placed near it diminishes with their distances, being inversely as the squares of the distances; hence, a clock carried from the bottom to the top of a hill loses time perceptibly, and so it is necessary to have the additional enactment that the pendulum be swung at the level of the sea.

In addition to these niceties, there are others connected with the manipulation, such as the parallelism of the knife-edges, their bluntness, the extent of the area of oscillation, and the stability of the supports, so that altogether the exact measurement of the length of the seconds pendulum is a matter of very great complexity. All these difficulties and troubles notwithstanding, we may hold that for all practical purposes, our system of weights and measures—and it may be added, the systems of all other civilized nations—is perfectly well established, whether it be regarded as derived from

the dimensions of the earth, or from the intensity of gravitation.

No system of measures can ever claim to be of universal application from which geographical dimensions are excluded. It is essential that the unit of measure bear some simple relation to the earth's circumference, for otherwise the operations of the surveyor will not accord with those of the geographer. The only question, therefore, in regard to the establishment of a cosmopolitan system, is as to the number of parts into which the earth's circumference is to be divided. Now, the denary system of numeration has already asserted its supremacy; one by one the schemes followed by different nations have given way to it, and their very languages have been modified by its influence; sufficient traces remain to shew how extensive these modifications must have been. The *three-score and ten* is not yet forgotten in English, nor the *quatre-vingt dix neuf* in French. In many trades the counting is still in dozens and grosses; yet our merchants count their interest, their discount, and their dividends in cents. The surveyor divides the foot on his levelling staff into tenths, hundredths, and thousandths; he makes his Gunter-chain of 100 links. The astronomer no longer divides the second into sixty thirds, but into hundredths; he gives his equinoctial time in decimal fractions of the day, and he makes the arguments for the planetary disturbances in thousandth parts of the whole revolution. There is no single instance in which the decimal system, once adopted, has been abandoned; slowly, but surely, its influence will increase until it have displaced every other system. See DECIMAL SYSTEM.

No one opposes the abstract principle that one system for the whole world would be best; but each nation retains an excusable partiality for its own measures. We can never do away with our good old English penny: what! shall we give up our time-honoured standard yard, and adopt the new-fangled French *mètre*? Admit the force of such short-sighted arguments as these for ourselves, and we must admit them for all other nations, we must remain where we are. The very idea of a cosmopolitan system carries with it that of national abnegation; and of this the French have set a noble example; they have put aside their ancient *toise*, their *lieu*, their *pie*, and their *pouce*, to adopt a measure which commends itself to all nations alike by its want of nationality; and the decimal system of measures and weights must, whether we will it or no, prevail against all others.

WEIGHTS AND MEASURES have, since 1824, been in great measure regulated by statute. The statute 5 Geo. IV. c. 74 was passed to enforce uniformity in the weights and measures used in various parts of Great Britain and Ireland; and a standard yard was defined as being then in custody of the clerk of the House of Commons, and it was enacted that all superficial measures should be computed and ascertained by the said standard yard. The act also described how, if the said standard yard were to be lost or destroyed, another was to be made. So the statute defined a standard brass weight of one pound troy, and a standard gallon. That statute was altered by a subsequent statute of 5 and 6 Will. IV. c. 63, and inspectors were authorized to be appointed by justices of the peace, who had power to examine and stamp weights and measures. It was enacted that any contract, bargain, or sale made by any weights or measures unauthorised by the act should be wholly void, and every such weight might be seized by the inspector, and forfeited. One or two exceptions were made by the act—such as weights above 56 lbs.; wooden or wicker measures used in the sale of lime; glass and earthenware jugs or

drinking-cups, though represented as containing the quantity of any imperial measure, or any multiple thereof, and these are not illegal, though incorrect. By a later act of 22 and 23 Vict. c. 55, inspectors have power to inspect the weights and measures of persons selling goods in streets and public places. By a statute of 29 and 30 Vict. c. 82, the custody of the imperial standards of weights and measures has been transferred to the Board of Trade; and periodical comparisons are to be made every ten years of certain standards.

WEIMAR, a small but interesting town of Germany, capital of the grand duchy of Saxe-Weimar-Eisenach, and residence of the grand duke, 60 miles south-west of Leipzig by railway. It stands in a pleasant valley on the left bank of the Ilm; but the environs are in no way remarkable, and the town itself is irregularly and rather poorly built. Though the residence of the court, and finding its subsistence in providing for the wants of distinguished visitors, W. carries on neither trade nor manufactures, and seems a dull, provincial-looking town. The lustre conferred upon W. by the residence here, at the close of the 18th and the earlier portion of the 19th centuries, of Goethe (q. v.), Schiller (q. v.), Herder (q. v.), and Wieland (q. v.) at the court of Karl-August (see SAXE-WEIMAR-EISENACH), has faded since that group was broken up by death; and now the interest of the town is almost wholly derived from its monuments, traditions, and associations. The town church (*Stadtkirche*), dating from the year 1400, has an altar-piece by Cranach, and contains a number of memorable tombs, among which are those of the brilliant soldier, Bernhard of Weimar (q. v.) and of Herder, the philosopher and critic. The ducal palace is a handsome building, some of the apartments of which are decorated by frescoes illustrating the works of Goethe, Schiller, Herder, and Wieland. The public library contains busts of these men of genius; and a number of relics, as the gown worn by Luther when a monk, and Gustavus Adolphus's leather belt, pierced by the bullet that caused his death at Lützen. The houses of Goethe, Schiller, and Herder are still pointed out. The two former of these poets lie interred in the grand-ducal burial-vault. The park and gardens of the palace, within which is the summer residence of Goethe, are much esteemed as a promenade. Pop. (1864) 14,279.

WEISSENFELS, a town of Prussia, in the government of Merseburg, and 12 miles south of the town of that name, on the Saale. Pop. 10,538, employed in the porcelain-factory and in wool-spinning, shoemaking, the manufacture of pianofortes, tanning, and a trade in timber. The castle, formerly the residence of the dukes of W., is now a barrack.

WELCKER, FRIEDRICH GOTTLIEB, one of the most distinguished scholars of Germany, was born in the year 1784 at Grünberg, in Hessen-Darmstadt; studied at Giessen; was appointed one of the masters of the Gymnasium there in 1803; and in the year 1806, travelled to Rome, where he remained two years. Here he became acquainted with the celebrated Danish archæologist, Zoega, whose *Life and Essays* he afterwards published, and by whose example he was stimulated to that subtle appreciation of the works of ancient art which appears everywhere in his works. On his return from Italy, he was appointed to a professorship of Ancient Literature, first in Giessen, then in Göttingen, and finally (1819) in the newly erected Prussian university of Bonn, which has since then been the great scene of his scholarly activity.

W. belongs to that class of scholars who, since

Heyne and Wolf, have given such a lofty inspiration, such a philosophical significance, and such a historical comprehensiveness to those studies which, for want of a better name, we are forced still to designate philology. But philology in this country generally means the history and philosophy of language; with the Germans, as it did originally with the Alexandrian Greeks, it means, the sympathetic understanding and the imaginative reconstruction of the life and thought of famous ancient peoples, based on the critical treatment of ancient documents, or the tasteful appreciation of the monuments of ancient art. It is needless to say that this 'philology' is a very different thing from the minute verbal and metrical preciseness which was long the leading characteristic of scholarship in this country. For however important these minutiae may be in their place, they are manifestly valuable only as means to an end; and even when the end has been steadily kept in view, it cannot be denied that some of our greatest intellects have spent more of their strength on these subsidiary matters than their importance deserves. In W., Otfried Müller, and other German scholars of the first class, we see a general reaction against this narrow school; and a reaction which was sure to prosper, as it was based on thorough academic training, and had learned to neglect no trifle and despise no minute point which could be made subservient to higher purposes. If it was the fault of German scholarship generally that it was too professional and too academic, it is the praise of Müller, W., and the school to which they belong that they have bridged over the gulf which separates learning from life, and inspired the dry bones of tradition with a spirit which makes them intelligible to the present, and significant of the future. The long academic career of W. has been marked by an uninterrupted course of scholarly activity. Many of his works are tracts and essays on archæological subjects without external unity, but all exhibiting a remarkable combination of extensive and accurate learning, fine taste, delicate sensibility, and sound judgment. We can only note here his three most important works of a larger compass. The first is the *Æschylean Trilogy* (1824), in which the organic connection and sequence of the Greek dramas are set forth with a richness of constructive detail not altogether free from that fanciful and problematic element which is one of the most distinguishing characteristics of German scholarship. The second is the *Epic Cycle* (1835—1849), a work which has done great service to the right appreciation of early Greek literature, by taking Homer out of that region of mysterious isolation in which he had been previously allowed to remain. The third, and perhaps his greatest work is the *Götterlehre*, or Greek Mythology, recently completed, which embraces all that is good, and rejects all that is bad in the wide German literature of this subject, with a delicate tact and a just discrimination as valuable as they are rare. Of all W.'s works, this is the one that would most probably bear with credit the ordeal of an English translation.

WELD, or WOOLD, also called DYER'S ROCKET, DYER'S WEED, and YELLOW WEED (*Reseda Luteola*), is a plant of the same genus with MIGNONETTE (q. v.), a native of waste places in England, very common in Germany and in many parts of Europe. It has an upright stem, 2—3 feet high; lanceolate, undivided leaves; and long racemes of small yellow flowers, with 4-partite calyx and prominent stamens. It is used for dyeing. In order that it may yield a good dye, it requires to be cultivated with care. The best is grown in France, England, and

Holland; and that produced about Cette, in France, is preferred to all other. Good W. must have flowers of a beautiful yellow or greenish colour, and abound

Dyer's Rocket (*Reseda Luteola*).

in leaves; that which is small, thin-stemmed, and yellow, is better than that which is large, thick-stemmed, and green; that which grows on dry sandy soils is better than that produced on rich and moist soils. It was formerly cultivated to a much greater extent in Britain than it is at present, and was also more used by dyers than it now is. W. is still, however, a valuable dye-stuff. It serves equally for linen, woollen, and silk, dyeing not only a rich yellow, but, with proper management, all shades of yellow, and producing a bright and beautiful colour. Stuffs previously dyed blue are, by means of W., changed to a very pleasing green.

Large quantities of W. are imported from France.

WELDING, the process by which some substances are united together in a softened state. It is generally applied to such metals as malleable iron, two pieces of which, heated to redness, may be made to unite by applying them together and beating with a hammer. Other substances, such as horn and tortoise-shell, can be welded by first making separate pieces soft by heat, and pressing them together, which causes so intimate a union that no traces of the junction remain after cooling.

WELLESLEY, RICHARD COLLEY WELLESLEY, MARQUIS, K.G., English statesman, was born at the town residence of his family, Grafton Street, Dublin, June 20, 1760. The family of Wellesley was of Saxon origin, belonging to the county of Sussex, and was among the most ancient in Ireland, one of them having gone from England as standard-bearer to Henry II., who gave him large grants of land in Meath and Kildare. William de Wellesley was, in 1334, summoned to parliament as Baron Noragh, and was high in favour with Edwards II. and III. The name (originally *Welesley* or *Wesley*) was written Wellesley till the 16th c., when it became abbreviated into Wesley. Mr Garrett Wesley of Dangan, county Meath, married Miss Colley, of Castle Carbery; and on the decease of his son without issue, the estates were bequeathed to his cousin, Richard Colley, who thereupon assumed the name of Wesley. The Colleys, originally Cowleys, were also of ancient descent, and came originally from Rutlandshire. Richard Colley, who thus succeeded to the Wellesley estates, though in no way related by blood to the earlier Wellesley family, was created Baron Mornington. His eldest son received (1760) the dignities of Viscount Wellesley and Earl of Mornington, and enjoyed the still more enviable distinction of being the father of the Marquis Wellesley, the subject of this notice, and of Arthur, first Duke of Wellington, by his marriage with the eldest daughter of Arthur, first Viscount Dungannon. W.'s father, the first Earl of Mornington, although chiefly known for his talents as a musical composer, was a man of great abilities. W. received his education at Eton, and afterwards at Christchurch, Oxford, at both which

seats of learning his fame stood high. An eloquent speech was made by him at Eton as early as 1778; and in 1780, he gained the University prize for the best composition in Latin verse, in which he excelled through life. His father having died in 1781, W., on attaining his majority, took his seat in the Irish House of Peers, took upon himself the pecuniary obligations of his father, and placed the estates under the management of his mother, who survived her husband for nearly half a century. The debts of the first earl were liquidated, but W. was unable to preserve the family possessions. He was one of the original Knights of St Patrick when the order was founded by George III. in 1783. It appears, from a correspondence between Pitt and the Duke of Rutland, that at the age of 24 he had convinced both statesmen that he was destined to distinguish himself, and to render the public essential service. Dissatisfied with the limited field of distinction which Ireland afforded him, he obtained, in 1784, a seat in the British House of Commons as member for Beer-alston. In 1786, he became one of the Lords of the Treasury, when he was elected for Saltash. Being unseated on petition, he obtained a seat for Windsor, and became a favourite of George III. Accident directed his attention to India, and in 1795, he became one of the unpaid members of the Board of Control. In October 1797, he received a seat in the House of Lords as Baron W.; and, at a most eventful period, was selected to go to India as governor-general. Four powers then divided the sovereignty of India—the British; Tippoo Sahib; the Nizam; and the Mahrattas, comprehending Scindiah, Holkar, and the Rajah of Berar; and the west of India was the scene of invasion by Zemaum Shah. Tippoo hated the English, and meditated their expulsion from India; and the troops in the service of the Nizam and the Mahrattas were officered by Frenchmen. When W. arrived at Calcutta, in May 1798, Egypt had been conquered by Bonaparte; and the native powers of India, incited by the French, were unfriendly to British rule. His first operation was one of great boldness. Disregarding the remonstrances of the Madras Council, he ordered the Nizam to disband 14,000 men, surrounded them with a British force, secured the 124 Frenchmen by whom they were officered, and sent them instantly to Europe. Having annihilated French influence, he began the reduction of the empire of Mysore. On the 3d February 1799, he ordered General (afterwards Lord) Harris to march with an army of 20,000 men direct from the coast upon the Mysore capital. He himself removed to Madras, to be near the scene of this eventful operation. In one short month, the fortress of Seringapatam was taken, Tippoo Sahib slain, and his dominions partitioned. Having thus, in fifteen months, destroyed French influence, struck terror into the native princes, and overthrown the most inveterate enemy of British rule in India, he returned to Bengal. Up to this period, he had been the Earl of Mornington; he was now (Dec. 1799) created by the king Marquis of W., and received the thanks of parliament. The East India Company offered him £100,000 of the prize-money realised at Seringapatam, but he refused, disdaining to be enriched out of military spoil. He afterwards accepted an annuity of £5000 voted him by the Court of Proprietors. His next step was to place the territories of the Nabob of the Carnatic under the administration of the Company, in consequence of the treachery of that prince. He also concluded a treaty with Persia, to which he attributed 'the fall of Zemaum Shah, the confusion of the Afghan government, and the repression of the annual project of invading Hindustan from Cabul'—then, as since, the nightmare of Indian statesmen. In 1801,

he sent a force of 7000 men up the Red Sea, to assist in wresting Egypt from the French. The expedition, under General Baird, reached Egypt, and effected a junction with the army from England; but the French had already surrendered. In 1802, in consequence of differences with the Court of Directors, he tendered his resignation; but was induced to continue in office until January 1806. The Mahratta war broke out; the battles of Laswaree, Assaye, Argaum, and Delhi were fought; and Scindiah, the Berar Rajah, and Holkar were stripped of their dangerous influence, and reduced to submission. A large accession of territory rewarded the gallantry of the army; and in 1805, W. returned to England, after the most brilliant administration ever known in India. He had outshone even the native princes in the pomp and splendour of his progresses. He built the palace of Calcutta; founded and patronised the college for Indian literature; stimulated every attempt of natives and Europeans to bring to light the vegetable, mineral, and physical treasures of the 'golden peninsula'; and inaugurated those important financial reforms which in a brief period raised the revenue of the Company from 7 to more than 15 millions sterling. On his return, he was received with every mark of respect and approval by the directors; but as matter of course, there were many complaints that his administration had been oppressive, especially towards the native powers; and articles of impeachment were even presented to the House of Commons, though they were rejected with contempt. He now prepared to enter anew upon a parliamentary career. George III. wished him to be one of the secretaries of state in the Portland cabinet, but he declined the offer. He went to Spain as ambassador-extraordinary in 1809; landed at Cadiz on the day the battle of Talavera was fought, and on the 2d November met his brother, the Duke of Wellington, at Seville. In December 1809, he was appointed Secretary of State for Foreign Affairs; and in 1810, was elected a Knight of the Garter. He was favourable, both in and out of office, to the repeal of the penal laws affecting the Roman Catholics; and when, in January 1812, the Prince Regent refused to agree to a concession of Roman Catholic claims, W. resigned his seat in the cabinet. During the first ten years of the administration of Lord Liverpool, he remained in opposition. He protested against the insufficiency of the means placed at the disposal of the Duke of Wellington, and did not cease to demand that he should be assisted to the utmost extent of the national credit and resources, until the Duke had crossed the Pyrenees at the head of his victorious army, and brought the war to an end before Toulouse. When the settlement of the affairs of Europe was being arranged in 1815, W. protested against the neglect of commercial interests, but without effect. He now began to ally himself with the more liberal section of the Conservatives, who looked up to Mr Canning as their leader, and accepted the office of Lord-lieutenant of Ireland. Conciliation was to be the principle of his government, but he held office for five years without effecting any material amelioration, owing to the difficulties arising out of the state of the penal laws. He was recalled from Ireland by his brother when he took office in 1828. In 1830, W. accepted the post of Lord-steward of the Household from Earl Grey; and in 1833, in the 74th year of his age, he again proceeded to Ireland as viceroy, where he remained until Sir R. Peel's administration of 1834. In 1835, on the restoration of the Whig party, he accepted the post of Lord Chamberlain, which he only held for a few months. In 1837, it became known to the Directors of the East India

Company that he was in straitened circumstances, and deriving little if any advantage from their annuity of £5000 per annum; they therefore resolved that a sum of £20,000 should be vested in trustees for his benefit. In 1841, it was further resolved that his statue should be erected in the court-room, as a mark of the admiration and gratitude of the East India Company. He died at Kington House, Knightsbridge, on the 25th September 1842; and, in compliance with his will, was buried in the vault at Eton College Chapel. An authentic record of his Indian administration was undertaken by Mr Montgomery Martin, under the direction and at the expense of the East India Company, and published in 1836 in 5 vols. 8vo, entitled *Despatches, Minutes, and Correspondence of the Marquis Wellesley, during his Administration in India*. A thin 8vo vol. issued in 1838 contains *Despatches and Correspondence of the Marquis Wellesley, during his Mission to Spain*. The marquis published several pamphlets on various occasions: *Substance of a Speech in the House of Commons on the Address in 1794*; *Notes relative to the Peace concluded with the Mahrattas*; *Letters to the Government of Fort George, relative to the new form of Government established there*; *Letters to the Directors of the East India Company on the India Trade*; &c. He was twice married, but left no issue, and the marquise became extinct at his death; the earldom, &c., went to his next brother, but afterwards reverted to the second duke of Wellington, as son of the great duke, who was third brother.

WELLINGBOROUGH, so called from the medicinal springs in its vicinity, is a market-town in the county of Northampton, 10½ miles east-north-east of the town of that name. It carries on a considerable trade in corn, boots, and shoes. Pop. (1861) 6067.

WELLINGTON, ARTHUR WELLESLEY, DUKE OF, K.G., one of England's greatest generals, was the third son of Garrett, first Earl of Mornington, and brother of the Marquis Wellesley (q. v.). He was born May 1, 1769, at Dangan Castle, Ireland, and completed his military education, a few years before the French Revolution, in the military college of Angers, in France. He entered the army as ensign in the 41st Regiment in 1787, and became lieutenant-colonel of the 33d in 1793. In 1794, he embarked in command of the 33d Regiment, to join the Duke of York's army in the Netherlands. In this, his first term of actual service, he commanded three battalions on the retreat of the army through Holland, and distinguished himself in several repulses of the French. In 1796, he accompanied his regiment to India, where his brother, the Marquis Wellesley, shortly afterwards arrived as governor-general. He commanded the subsidiary force of the Nizam, when the reduction of the Mysore was decided upon, and his division defeated Tipoo Sultan's right flank at Mallavelly. At the assault and capture of Seringapatam, he commanded the reserve in the trenches. He was appointed to the command in Mysore, and took the field (1800) against Dhoondiah Waugh, a Mahratta freebooter, who was defeated and slain. He was named second in command of the expedition which sailed from India to assist the English army in Egypt, but was prevented from embarking by illness. It was in the Mahratta war of 1803 that the young general won his first fame. After besieging and capturing Ahmednuggur, W., with only 4500 men, came upon the combined Mahratta forces, 40,000 or 50,000 strong, and not waiting for a larger British force that was on its way, won the brilliant victory of Assaye (q. v.). The victory of Argaum followed; and the great fort of Gawulghur, supposed to be impregnable,

having been taken in December, the Mahratta chiefs sued for peace, after one of the most extraordinary campaigns on record. W. was made K.C.B., and received the thanks of the king and parliament. In 1805, he returned to England, and in November commanded a brigade in Lord Cathcart's expedition to Hanover. In 1806, he obtained a seat in the House of Commons for Newport, Isle of Wight; and in April 1807, was appointed Chief-secretary to Ireland, the Duke of Richmond being Lord-lieutenant. He held a command in the army under Lord Cathcart, in the expedition against Copenhagen in 1807; and after the affair at Kiøge, negotiated the capitulation of Copenhagen. He received the thanks of the House of Commons in his place, and returned to Ireland. In 1808, he commanded an expedition which sailed from Cork, being the first division of the British army sent out to assist in the expulsion of the French from Spain and Portugal. He landed at Corunna, and offered his aid to the army and people of Galicia; but the offer being declined, he finally landed (August 1808) with 10,000 troops at the mouth of the river Mondego, in Portugal. The whole of the north of Portugal was then in arms against the French. The affairs of Obidos and Roliça were quickly followed by the battle of Vimieira, in which he defeated Junot, who lost 3000 men and 13 pieces of cannon. After this event W. signed the armistice which led to the Convention of Cintra (q. v.). He subsequently gave evidence generally in favour of this Convention at the Court of Inquiry (November 22). Being superseded in the command of the army by men who were only his superiors in military rank and seniority, he returned to England. For the battle of Vimieira, he again, in his place, received the thanks of the House of Commons. On the death of Sir John Moore, he returned to re-assume the command of the Peninsular army, previous to which he resigned the office of Chief-secretary of Ireland. He arrived at Lisbon, and assumed the command April 22, 1809. He had now to contend with Soult and Victor, who had entered Portugal at the head of a veteran army, and were in possession of its finest northern provinces. Oporto had been taken by Soult, and W. was anxious to bring him to action at once, in order that he might not make his retreat unharmed. The passage, at Villa Nova, of the Douro, a wide, deep, and rapid river, in the face of a formidable enemy, who had removed every boat and barge to the opposite side of the river, was one of the boldest and most successful operations of the war. W. entered Oporto the same day, and followed the French army. He was now, by a decree of the Prince Regent of Portugal, Marshal-general of the Portuguese army. The French had fallen back to a point where reinforcements were to meet them; and on the 27th and 28th July 1809, the enemy, commanded by Victor and Sebastiani, were defeated by the British under W. at Talavera. The slaughter on both sides was terrible, in this desperate, almost hand-to-hand conflict. W. was unable to follow up his victory owing to the non-co-operation of the Spanish army under Cuesta; and the want of supplies, and the junction of Soult, Ney, and Mortier in his rear, compelled him to fall back upon Badajoz. The thanks of parliament were voted for the victory of Talavera, and Sir Arthur Wellesley was created (4th September 1809) a peer by the titles of Baron Douro of Wellesley and Viscount Wellington of Talavera, with a pension of £2000. In May 1810, the French collected under Massena in such superior force in his front that he fell back upon Busaco, where he made a stand. Here the French (September 27) made two attacks upon his position, but were repulsed with great slaughter. After

this, he retreated to Torres-Vedras (q. v.), to the occupation of which line of defence, and his judicious method of maintaining it, the ultimate success of the Peninsular war may be chiefly attributed. Massena, being unable to find subsistence for his army, began his retreat to Santarem, followed by W., who pursued the French in their retreat along the line of the Mondego. In April 1811, he received the thanks of parliament for the liberation of Portugal. Spain, however, was now subdued by the French. The Spanish armies were annihilated, and it was of the last importance that W. should be able to keep his rear open to the Tagus. W. having invested Almeida, Massena attempted to relieve it, but was skillfully repulsed at Fuentes de Onoro, May 3 and 5. The fall of Almeida followed, and W. ordered Badajoz to be invested. At this time, he had great reason to complain of the want of support and reinforcements from England. He had only the force which had followed Massena from Torres-Vedras, diminished by 9000 men, *hors de combat* in so many sanguinary encounters. Writing to Marshal Beresford, he said: 'I enclose a dispatch from Lord Liverpool [then at the head of the Home Government]; I believe they have all gone mad.' The siege was carried on with vigour; but learning that Soult and Marmont designed to join their armies into one, in order to relieve Badajoz, and his own inadequate force not justifying him in risking a battle, he raised the siege, and retired to the frontiers of Portugal. He next laid siege to the strong fortress of Ciudad Rodrigo; and on the night of January 19, 1812, it was carried by storm, and the garrison made prisoners. For this achievement he was created by the Regency a Grande of Spain, with the title of Duque de Ciudad Rodrigo. He again received the thanks of parliament, and a further pension of £2000 a year, and was advanced in the British peerage by the title Earl of Wellington. He next marched towards Badajoz, invested it in March, and carried it by storm, April 6, after a frightful carnage; the allies losing nearly 5000 men. In June, he advanced to Salamanca, captured the convents there, which had been fortified by the French, and drove Marmont to the Douro. On the 22d July, he gained at Salamanca one of his greatest military triumphs. Marmont extended his line, with the view of turning W.'s right; but the latter, perceiving that the enemy had thus weakened their left and centre, vigorously assailed the weak points, and after an obstinate resistance, put the whole army to rout. Ammunition, stores, two eagles, eleven pieces of cannon, and 7000 prisoners, were the trophies of victory. The loss of the allies was only about 700 killed and 4000 wounded. Marmont lost an arm, and four French generals were killed. W. received the order of the Golden Fleece, entered Madrid, was made generalissimo of the Spanish armies, and was advanced in the British peerage by the title of Marquis of Wellington. The thanks of parliament were again voted to him, together with the sum of £100,000, to be laid out in the purchase of lands to be settled on him, his heirs, and successors. In September, he marched to Burgos, but failing to capture it, he again retreated to the frontiers of Portugal. W. visited Cadiz and Lisbon, where he was received by the whole population. In May, he marched his army into Spain in two columns, and on the 21st June gained, at Vitoria, another signal victory over the French, commanded by King Joseph, assisted by Marshal Jourdan. The enemy lost 151 pieces of cannon and all their ammunition. The king's private carriage, letters, &c., fell into the hands of the victors. In exchange for the bâton of Jourdan, which was found on the field, the

Prince Regent forwarded to W. the bâton of a field-marshal of England. By this splendid and important series of victories, he had reached the summit of martial glory. The deliverance of Spain from the French was now certain. His infantry were soldiers who would, in his own words, 'go anywhere and do anything;' and even the invasion of France itself seemed to his countrymen to be no longer chimerical. He pursued the French army to France by Pamplona. He failed, July 25, to carry San Sebastian by assault, but gained another decisive battle over Soult at the Pyrenees, and the French army retreated into France. A second attempt to carry San Sebastian by assault was successful, but it cost W. 2300 in killed and wounded. He now crossed the Bidassoa, and invaded France. Pamplona surrendered. After the passage and battle of the Nivelle, and the passage of the Nive, the victorious army of W. was attacked, December 10 to 18, on the left and right, by Soult, who was defeated. Leaving two divisions to blockade Bayonne, W. followed Soult with the rest of the army. On 27th February 1814, he defeated Soult at Orthes, and crossed the Adour. The affairs of Aire and Tarbes were followed by the passage of the Garonne; and on the 10th April, W. consummated this series of brilliant victories by again defeating Soult under the walls of Toulouse. The allied Russian and German armies having entered Paris, and Napoleon having signed his abdication a few days before, this last battle would not have been fought, but for the non-arrival of news of the events of Paris. In a few weeks W. was in Paris, presenting the trophies of his brilliant campaign to the allied monarchs. He was created, May 3, Marquis of Douro, and Duke of W. in the British peerage, and received an additional grant of £400,000. He received for the twelfth time the thanks of parliament for his services, and on his arrival in England was greeted with the utmost enthusiasm. On the 28th June, he took his seat for the first time in the House of Lords. He next returned thanks at the bar of the House of Commons, and was addressed by the Speaker. He was appointed ambassador-extraordinary to the court of France in July 1814, whence he proceeded to the congress of Vienna. Napoleon having escaped from Elba, the congress was abruptly broken up. W. was appointed commander of the British forces on the continent of Europe, and from Vienna joined the army at Brussels. It appeared probable that Napoleon would make a bold advance into Belgium, and its defence was assigned to an Anglo-allied army under W., and a Prussian army under Blücher. The battles of Ligny (q. v.) and Quatre Bras (q. v.) were succeeded on the 18th June 1815 by the great battle of Waterloo (q. v.). Here the grand and decisive blow was struck; here for the first and last time the Emperor and the great English general met and measured swords, and here the power of Napoleon was finally crushed. The allied armies, under W. and Blücher, marched upon Paris; the French army evacuated Paris under a convention; and Louis XVIII. entered Paris the very day after the English army. Marshal Ney was brought to trial. He relied upon the terms of the capitulation of Paris, and appealed in vain to W., who denied that the French king was bound by the convention—a reading which it is impossible to justify, as Sir A. Alison has shewn in his *History of Europe*. At the request of the allied sovereigns, W. took the command of the army of occupation, and resided in Paris from 1815 to 1818. Two attempts were, during this period, made upon his life: gunpowder was placed in his cellar for explosion; and one

Cantillon discharged a pistol into his carriage; for which attempt at assassination, Napoleon I. left the miscreant a bequest in his will. When the allied armies evacuated France in 1818, the emperors of Russia and Austria, and the king of Prussia, created W. a field-marshal of their armies. He was created Prince of Waterloo by the king of the Netherlands. The gratitude of the British nation was, meanwhile, enthusiastically manifested. Statues were raised to his honour in the metropolis. Parliament voted £200,000, in addition to former grants; and the mansion and estate of Strathfieldsaye were purchased, to be held by W. and his heirs. The office of Master-general of the Ordnance, now abolished, but then comprehending the control of the artillery branch of the service, was conferred upon him. At the coronation of George IV., in 1821, he officiated as Lord High Constable of England. In October, he attended George IV. to the field of Waterloo. In 1822, he represented Great Britain at the Congress of Verona, where he ineffectually exerted his influence to prevent the invasion of Spain by a French army, in support of absolutist principles. In 1826, he went on a special embassy to St Petersburg, when he induced the Emperor Nicholas to act in common with England and other powers, as mediators in the quarrel between Turkey and Greece. On his return, he was appointed Constable of the Tower. In 1827, he succeeded the Duke of York as commander-in-chief of the army, and was made colonel of the Grenadier Guards.

From this period, his political career may be said to begin. When Mr Canning received the commands of George IV. to form an administration, W., with six other members of the Liverpool administration (including Lord Eldon and Peel), resigned office. In the explanations which he gave, he emphatically denied that he had entertained the ambition of himself filling the post of first-minister; and said he felt his incapacity for such an office so strongly that he should have been 'mad' if he had coveted it. In August 1827, after Mr Canning's death, he again accepted the command of the army, which he resigned on being called upon by George IV. (January 8, 1828) to form an administration. Of strong Tory politics, he was, nevertheless, the first minister to cede to the growing popular power. The Test and Corporation Acts were repealed, and the removal of the Catholic disabilities was the first measure proposed by W. in the following session, upon the ground of the formidable attitude of the people of Ireland and the danger of civil war. This measure involved him in a bloodless duel with the Earl of Winchelsea. The French revolution of 1830 appears to have influenced him in making a firm stand against reform in parliament, in the same proportion that it raised the demands of the people; and when the struggle of Continental Europe to emancipate itself from arbitrary government, strengthened the popular cry for 'parliamentary reform,' he chose the earliest moment to declare the unalterable perfection of the representative system of the country, and the determination of his government to resist all measures of parliamentary reform. His unpopularity became excessive; and anticipating a defeat in the House of Commons, on Mr Brougham's proposition for reform in parliament, W. resigned office, and was succeeded by Earl Grey. He had meanwhile become Lord Warden of the Cinque Ports. Under the administration of Earl Grey, W. held no office. He strenuously opposed the Reform Bill, and a London mob broke the windows of Apaley House, and hooted and pelted him in the streets. In January 1834, he was elected Chancellor of the university of Oxford. Upon the enforced resignation of Lord Melbourne,

in November 1834, he was sent for by William IV. He declined to take the premiership, and was intrusted by the king with the whole charge of the government, and the seals of the three Secretaries of State, until Sir R. Peel could arrive from Rome. Peel constructed a Conservative government, in which W. took the office of Foreign Secretary. In April, Peel resigned, and henceforward W. ceased to take a prominent share in the civil government of the country. He gave a generous welcome to Soult, who represented France at the coronation of Queen Victoria, and was received with great cordiality by the people on this occasion. In August 1839, a grand banquet was given to him at Dover, as Lord Warden of the Cinque Ports, on which occasion Lord Brougham proposed his health in a brilliant eulogium. In 1841, he accepted a seat in the cabinet of Sir R. Peel, without office. In 1842, the Queen visited him at Walmer Castle, and in the same year he was reappointed to the command of the forces. In 1845, he doubted the policy of repealing the Corn Laws; but in conformity with his usual practice, of considering 'how the Queen's government was to be carried on,' he determined to stand by Sir R. Peel in his attempt to abolish them. W. not merely consented to remain in the cabinet, but accepted the higher office of President of the Council in lieu of the post of Lord Privy Seal. When the bill came up to the Lords, W., with great emotion and earnestness, warned the peers not to reject the bill, and never to separate themselves from both the crown and the House of Commons. His speech made a great impression, and the bill passed a second reading by a considerable majority. He retired with the Peel government in July 1846. After this event, he may be said to have withdrawn from political strife, nor is it to be denied that his share in the repeal of the Corn Laws cast a halo of popularity around the remainder of his life. In 1848, he called attention to the unsatisfactory state of the national defences, in a letter to Sir J. Burgoyne. As commander-in-chief, he directed great preparations to be made to prevent a Chartist outbreak on the 10th April. His last speech in the House of Lords was delivered in support of the Militia Bill, when he declared that England had been carrying on war in all parts of the world with an insufficient peace establishment. On September 14, 1852, he was seized at Walmer Castle with an epileptic fit, became speechless, and died the same afternoon. His remains were honoured by a public funeral. The body, after lying in state at Chelsea Hospital, was removed to the Horse Guards; and on the morning of November 18, was borne through the streets of London to St Paul's Cathedral, where it rests by the side of that of Lord Nelson. The funeral pageant was witnessed by a countless multitude. His *Despatches*, published by Colonel Gurwood, in 12 vols., are the proudest monument of his glory; they exhibit him as a commander who overcame countless difficulties by honesty, sagacity, singleness and constancy of purpose, and devotion to duty. Throughout his long career, he appears the same honourable and upright man, devoted to the service of his sovereign and country, and just and considerate to all those who served under him. As a general, he was cautious, prudent, and careful of the lives of his men; but when safety lay in daring, as at the battle of Assaye (q. v.), he could be daring in the extreme. He enjoyed an iron constitution, and was not more remarkable for his personal intrepidity than for his moral courage. The union of these qualities obtained for him the appellation of the 'Iron Duke,' by which he was affectionately known in his later years. His parliamentary oratory was plain and to the point. He spoke without

fluency or art, yet his strong sense and practical sagacious judgment gave him great weight with his brother-peers. His tastes were aristocratic; and his aides-de-camp and favourite generals were almost all men of family and high connections. Altogether, he was the very type and model of an Englishman; and in the general order issued by the Queen to the army, he was characterised as 'the greatest commander whom England ever saw.' He married, in 1806, the second daughter of the third Earl of Longford, and by her (who died in 1831) he left two sons—Arthur, the second duke (who also inherited the earldom of Mornington), and Charles, deceased, whose son, Henry Wellesley, is heir-presumptive to the title.

Colonel Gurwood's *Despatches of the Duke of Wellington*, 12 vols.; Gurwood's *General Orders of Duke of Wellington, 1809—1818*; Napier's *History of the Peninsular War*; Alison's *History of Europe*; Thibaudeau, *Histoire de l'Empire*; Thiers, *Histoire de l'Empire*; Marquis of Londonderry's *Narrative of the Peninsular War, 1808—1813*; Gleig's *Life of Arthur, Duke of Wellington*; Bourrienne's *Mémoires sur Napoleon*; Las Casas, *Mémoires de Ste-Hélène*; *La Vie de Wellington*, by Brialmont; *Speeches in Parliament of Duke of Wellington*; *Sir R. Peel's Memoirs*, by his Literary Trustees; *Despatches, Correspondence, and Memoranda of Field-marshal Arthur, Duke of Wellington*, edited by his son the Duke of Wellington. This is a continuation of the former series of the Wellington Despatches and Correspondence; vol. i. (breaking off at December 1822) has just appeared (1867), and this series will be brought down to the latest date. See also *Correspondance de Napoleon I.*, an official record of the thoughts and acts of the emperor, now in course of publication at Paris.

WELLINGTON, a small market-town in the county of Somerset, 7 miles south-west of Taunton, at the foot of the Blackdowns, which are crowned by a monument commemorative of the battle of Waterloo. The town gives title to the Duke of Wellington. Blankets, serges, and other woollen goods and earthenware are manufactured. Pop. (1861) 3689.

WELLINGTON, a small market-town of Shropshire, 10 miles east of Shrewsbury, at the foot of the Wrekin, on the Shrewsbury and Shropshire Canal. The town forms the junction of several railways. It is situated in a populous mining and agricultural district, with coal and iron mines, iron-works, limestone quarries, and wire-mills in the vicinity; while, in the town, there are smelting-furnaces, nail-works, and malt-kilns. A spacious public market, with town-house and assembly room, has recently been erected at a cost of about £20,000. The town has been recently thoroughly drained. Pop. (1861) 5576.

WELLINGTONIA, a genus of trees, of the natural order *Coniferae*, of which only one species is known, *W. gigantea*, the greatest of all pines, and indeed by far the largest tree of temperate climates. The genus is nearly allied to *Sequoia* and *Taxodium*. The foliage is very similar to that of an arbor vite, the leaves being very small, like scales, and closely appressed to small slender branchlets. The leaves of young plants are longer and somewhat needle-shaped. The branches divide into very numerous small branchlets. The flowers are generally solitary and terminal, the male and female flowers distinct, but on the same tree. The cones of the *W. gigantea* are ovate, from 1½ to 2 inches long, by 1½ inch broad, single, or in opposite pairs, rarely clustered, the scales wedge-shaped, with about four seeds under each. The *W. gigantea* has a columnar stem, with

branches only on the upper half of it, the branches of comparatively small size, and not forming an umbrageous head. The stem attains a height of 300 feet, and sometimes more, perfectly straight and erect. One tree is known, 321 feet in height; and

Wellingtonia gigantea: The Three Graces.
(Copied from Hutchin's *Scenes of Wonder in California*.)

near it lies a larger one, which has fallen, and which was broken against another large tree in its fall, its diameter where it was broken, 300 feet from its base, being 18 feet. Another tree is 102 feet in circumference at the base. The *W.* is found only in a limited district in California, on the Sierra Nevada, at an elevation of 4000 to 5000 feet above the sea.

Cone and foliage of the *Wellingtonia gigantea*.

It was discovered in 1850, by Mr Dowd, who, being engaged in deer-hunting, came with astonishment into the midst of a group of these trees, now known as the Mammoth Trees of Calaveras. In this locality, within an area of 50 acres, are 123 large trees, 20 of which exceed 25 feet in diameter at the base, and are therefore about 78 feet in circumference. A tree which was felled was 302 feet in height, and 96 feet in circumference at the ground. It was sound to the centre. Its age may be guessed at something like

3000 years. It was calculated to contain about 500,000 cubic feet of timber. Five men were employed for 22 days in felling it, by boring great auger-holes and sawing between them. When it had been cut through, it remained steadfast on its base, and more than two days were spent in driving in great wedges, to cause it to fall. A round wooden house has been erected on the stump, where dancing-parties sometimes enjoy themselves. For several years, the *Wellingtonias* of Calaveras were supposed to be the only trees of their kind in existence, but groups have more recently been found in other parts of the same district, and scattered trees in a number of localities. The *W.* has been introduced into Britain, the climate of which is very suitable to it; fine young trees are now to be seen in many places, and plants are common in nurseries. The *W.* has been called *Washingtonia* by some American writers, but no reason, except national feeling, has been alleged for the change of the name. According to the generally acknowledged rule in natural history, the older name must be retained.

WELLS, an ancient city and municipal and parliamentary borough, in the county of Somerset, pleasantly situated at the foot of the Mendip Hills, 15 miles south-west of Bath. It is a clean and cheerful town, with runlets of water flowing through each principal street. The cathedral, a remarkably beautiful edifice, begun in 704, and enlarged in 1138, is for the most part in Early English; but its west front, one of the noblest façades in the kingdom, and which is enriched with 300 statues, is in Gothic. The bishop's palace, originally founded in 1088, is surrounded by a moat supplied from the abundant source of St Andrew's Well—from which the town is said to derive its name—and by lofty walls. There are no manufactures, and the trade is chiefly retail. Pop. (1861) 4648.

WELL-STAIRCASE, a winding staircase with an aperture left in the centre, called the *well*, by which light and air are admitted.

WELSER, the name of a famous extinct patrician family in Augsburg. **JULIUS W.** was knighted by the Emperor Otto I. for his services in the war against the Hungarians. His son, **OCTAVIAN W.**, settled in Augsburg, and from him descended the patrician family, which always held important posts in the council of that town. **BARTHOLOMEW W.**, privy councillor of the Emperor Charles V., was so wealthy, that he could vie with the Fuggers (q. v.) in munificence. With the emperor's permission, in 1526, he fitted out three ships in Spain, which, under the command of Ambrose Dalfinger of Ulm, sailed for America, and took possession of the province of Caracas, which the emperor gave W. in pledge. Twenty years after this, the Welsers gave up their possession voluntarily, and it reverted to Spain.—The most famous of the family was the niece of Bartholomew W., **PHILIPPINE W.**, a daughter of his brother, Franz W., born about 1530. She had received an excellent education from her clever mother, and was exceedingly beautiful. On the occasion of a Diet of the empire at Augsburg in 1547, she was seen by the Archduke Ferdinand, the second son of the subsequent emperor, Ferdinand I., who fell in love with her. The young girl firmly rejected all the advances of this fiery youth of 19, and refused to have any relation with him excepting by marriage. They were therefore married in 1550, without the knowledge of his father, or of his uncle, Charles V. His father, on hearing the news, was exceedingly angry, and for a long time his son did not venture to appear before him. Even in other countries, this misalliance made a great noise. In the meanwhile,

the loving couple enjoyed the greatest domestic happiness, and Philippine enchanted every one that knew her by her intelligence and kindness of heart. It was only after eight years that his father was reconciled. Philippine, in disguise, herself handed him a petition, and by her deportment on the occasion, as well as her beauty, disarmed the angry father. He forgave his son, declared his children legitimate, and raised their mother to be Markgravi von Burgau. This happy marriage lasted 30 years. Philippine died at Innsbrück in 1580. In the palace at Schönbrunn, the portrait of the lovely Philippine is still pointed out.

WELSH LANGUAGE AND LITERATURE. The Celtic languages are divided into two groups, Gaelic and Cymric. To the latter of these the Welsh belongs, and has even given name, as forming the most important member of the group, which comprises besides, Armorican (spoken in Bretagne) and Cornish (now extinct). A controversy has been waged concerning the nature and closeness of the intimacy existing between the Gaelic and Cymric tongues, but the question may now be considered settled by the researches of the Rev. Richard Garnett (*Gentleman's Magazine*, May 1839), who found, on examining the monosyllabic words in the introductory part of Neilson's *Irish Grammar*, that out of 270, no fewer than 140 were identical in sense and origin with corresponding Welsh terms, that 40 were cognate, an equal number borrowed from Latin, Saxon, &c., and that only 50 were peculiar to the Gaelic. Nevertheless, it is not to be supposed that the affinity is as close as that which exists between English and so-called Scotch. It is rather (according to Mr Garnett) such as exists between Icelandic and German. A Welshman cannot understand a Highlander or an Irishman; he cannot even understand a Breton (as used to be believed), though the language of the latter is undoubtedly Cymric. Most extraordinary hallucinations were formerly current in regard to the antiquity of the Cymric tongues. Pezron, the Breton investigator, gravely affirmed that Welsh and Armoric (which he considered the same) had been 'the language of the Titans, that is, the language of Saturn, Jupiter, and the other principal gods of heathen antiquity.' The Rev. Joseph Harris, editor of the *Seren Gomer*, remarked in 1814 that 'it is supposed by some, and no one can disprove it, that Welsh was the language spoken by Adam and Eve in Paradise.' The fact, on the other hand, is, that of the two branches of Celtic, the Cymric is less ancient than the Gaelic, and that among the Cymric tongues the Cornish is probably older than the Welsh. (See Norris, *Ancient Cornish Drama*, Oxford, 1859.) But preposterous as the views of most patriotic Welshmen are on this subject, it is undoubtedly true that the Welsh is one of the oldest living languages in Europe, and that it possesses a literature reaching back to remoter times than that of any modern tongue except Irish. The most striking peculiarities of the language are the abundance of its grammatical permutations, and its facility in forming derivatives and compounds. Of the former, two examples may be given by way of illustration. The Welsh word for 'father' is *tad*; for 'my,' *fy*. But you cannot say for 'my father,' *fy tad*. After *fy*, every word beginning with *t* must change the *t* to *nh*; and therefore the correct phrase is *fy nhad*. So after *ei*, *tad* becomes either *dad* or *thad*, according as *ei* means 'his' or 'her.' The rules of permutation are almost endless, and, in the opinion of such Welsh scholars as are not Welshmen, useless, nothing being gained in point of euphony, or expressiveness. The Welsh affirm that their language is ex-

ceedingly harmonious, and it would serve no good purpose to dispute the assertion; but foreigners ignorant of the tongue, and associating no definite ideas with the words that issue from a Welshman's lips, generally fail to realize the fact, and consider it in this respect—though not in others—distinctly inferior to Gaelic. The language, or rather the structure of sentences and the phraseology, exhibits a certain stateliness, or even grandiloquence, characteristic, indeed, of uncivilised nations. One thing specially deserves notice. The Welsh people are profoundly attached to, and familiar with it. It is not dying out, like Irish or Scotch Gaelic. It has a genuine literary, as well as oral existence even now, and though the changes it has undergone since the days of Taliesin are numerous and great—so great, indeed, that no modern unlettered Cambrian can understand a word of the early poetry of his country—yet it is essentially the same tongue as Cæsar and Agricola heard, and is consequently to be regarded with veneration as the solitary living link that unites those distant ages with our own.

There are extant, says Owen Pughe, some thirty old treatises on Welsh grammar and prosody. The most important of these is one composed by Geraint (880 A.D.), revised by Einion (1200 A.D.), and regularly privileged by the sovereigns who then exercised authority in Wales. It was first printed by the Welsh MS. Society in 1856, under the editorship of the Rev. J. Williams ab Ithel. Among English grammars of the Welsh language, the best is said to be that by the Rev. Thomas Rowland (2d ed. 1857); among dictionaries, that of Owen Pughe, entitled *Geiriddwr Cymraeg a Saesoneg, a Welsh and English Dictionary* (2 vols. 1793; 3d ed. 1861, *et seq.*). It is, however, only a Welsh-English dictionary; the most satisfactory English-Welsh dictionary is that published by Daniel Silvan Evans (2 vols., Denbigh, 1852—1858).

The literature of Wales has been arranged into four periods: the *first* extending from the earliest times to the Norman Conquest (1066 A.D.); the *second*, from the Norman Conquest to the English Reformation (*circa* 1536 A.D.); the *third*, from the English Reformation to the beginning of the reign of George III. (1760 A.D.); and the *fourth*, from 1760 to the present day. To what date the oldest specimens of Welsh literature ought to be assigned, has been the subject of sharp dispute. These specimens are in verse, and are rhymed. The chief of their alleged authors, with their supposed periods, are Aneurin (510—560 A.D.), Taliesin (520—570 A.D.), Llywarch Hen, or 'the Old' (550—640 A.D.), and Myrddin or Merlin (530—600 A.D.). According to Pinkerton (see his preface to *Barbour*) and Laing (*Dissertation on Ossian*), they are not authentic; but the vindication of their authenticity, first by Sharon Turner in 1803, and afterwards, and more critically, by Mr Stephens of Merthyr-Tydvil, in his *Literature of the Kymry* (1849), and Mr Nash, in his *Taliesin, or the Bards and Druids of Britain* (1858), is considered conclusive. The last two of these writers, however, may almost be said to meet their opponents half-way. Of the seventy-seven poems ascribed to Taliesin in the *Myvyrian Archæology of Wales* (a collection of all the most celebrated works in Welsh literature, 500—1400 A.D.), which appeared in 1801—under the auspices of Mr Jones, Mr Edward Williams (better known as 'Edward of Glamorgan'), and Dr Owen Pughe—Mr Stephens considers fifty-seven to be demonstrably spurious, and only twelve to be probably genuine, that is, belonging to the age of Taliesin. Mr Nash enables us to form an independent judgment on the point, for he translates some fifty of these poems, and we

find that, instead of their exhibiting an antique Welsh character, they abound in allusions to mediæval theology, and frequently employ mediæval Latin terms. It is certainly unfortunate for the reputation of the 'Chief of the Bards,' that the specimens of his which are considered to be genuine possess exceedingly small poetic merit. The life of this famous but apparently over-rated genius is, of course, enveloped in legend. He is said to have been the son of a certain St Henwg, and to have been educated at the College of St Cadog. His life was spent successively at the courts of Urien Rheged, Gwyddno, Prince of Cardigan, and King Arthur, and his sepulchre is shewn near Aberystwith. It is still called *Bedd Taliesin* (Taliesin's Grave). Of the poems whose authorship is ascribed to Aneurin, a prince of the Cumbrian Britons, the most notable is that entitled *Gododin*, in which he pathetically laments a defeat of his countrymen by the Saxons. It is reckoned authentic. (Several English translations of the *Gododin* have been published, and a translation of the whole works of Aneurin was published by Mr Probert in 1820.) Llywarch Hen, also a Cumbrian warrior, is regarded as the finest and most poetical of all the semi-historical Welsh bards. Tradition reports that he lived to the age of 150. The burden of his verse is the miseries of old age, on which he descants with melancholy eloquence. (See *The Heroic Elegies and other Pieces of Llywarch Hen, Prince of the Cumbrian Britons*, with a literal translation by William Owen, 1792.) The pieces ascribed to Merddyn, in the *Mynyrian Archaeology*, are in all probability spurious. Besides the names already mentioned, other poets of the first period are Gwyddno, Gwilym ab Don, Golyddan, &c.

The earliest specimen of Welsh prose now extant is the collection of the laws of King Hywel Dda, or Howel the Good (died 748 A.D.)—a work of great value in illustrating the manners and morals of early Welsh times, but it is very uncertain when or by whom the collection was made. The oldest extant MS. belongs to the 12th century. The latest and most critical edition (Welsh and English) is that published in 1841 by the Record Commission, and edited by Aneurin Owen, son of Dr Owen Pughe. Another work, entitled *The Wisdom of Cadog the Wise* (a collection of proverbs pretending to be by a St Cadog, who flourished in the 6th c., and was a friend of Taliesin), is of such doubtful authenticity that its claim can only be noticed in our sketch.

Second Period, 1066—1536.—A few years after the date of the Norman Conquest, a new spirit was imported into Welsh poetry by the influence of Gruffydd ab Cynan, Prince of North Wales, and Rhys ab Tewdwr, Prince of South Wales, particularly of the former. Gruffydd had been born during his father's exile in Ireland, and was brought up in that country, where he appears to have acquired a familiarity with both the native Celtic literature and that of the Dano-Norse invaders. In the year 1100, he held a great Eisteddfod at Caerwys in North Wales, which was numerously attended by Irish bards and musicians. For the next three hundred years, Wales is rich in native bards, a fact that conclusively refutes the tragic story of Edward I. having caused them all to be slain, lest their patriotic songs should stir the Welsh to renew the struggle for independence. Nearly sixty names occur in the *Mynyrian Archaeology* between 1120—1380. The first is that of Meilyr (1120—1160), whose best piece is entitled *The Deathbed of the Bard*. Meilyr's son, Gwalchmai ab Meilyr (1150—1190), who is said to have accompanied Richard Cœur de Lion to Palestine, is a superior poet to his father. Fourteen of his productions are extant. Gwalchmai's son, Ionion (1170—1220), also figures as a

poet. Forty pieces are ascribed to Cynddelw (1150—1206), a contemporary of Gwalchmai, of which probably the most interesting is *The Deathbed of Cynddelw*. He has also some verses addressed to Prince Madog or Madoc of Powys, whom enthusiastic Welshmen conceive to have discovered America before Columbus. Other bards of this second period are Llywarch ab Llewellyn (1160—1220); Hywel (1140—1170), a brother of Prince Madoc, and writer chiefly of erotic odes; Owain Cyveilioc (1150—1197), also of princely rank, whose *Hiras*, or the *Long Blue Horn*, is a great favourite with more than Welshmen; and above all, *Davydd ab Gwilym* (circa 1340—1400), who has been compared to Ovid, to Petrarch, and to Burns. In his verses, Welsh poetry undergoes a change—the bardic or Scaldic spirit disappears, and a more humane, if less patriotic spirit takes its place. Davydd sings of love and of social amusements; he was likewise a fierce satirist, though at times very penitent and pious; while, to complete his resemblance to the Scottish poet, and also to justify the biblical name he bore, he shewed an unmistakable predilection for illicit love. Davydd's poems were first published in Welsh, with a biography of the author by Owen Jones and Owen Pughe (1789). An English translation of some of them by Mr A. Johnes appeared in 1834. Besides the poets already mentioned, the following names are in high repute: Iolo Goch, the friend and bard of the famous Owen Glendower, who is said to have lived to the age of 120; Sion Cent ('John of Kent'), a name given him from Kentchurch, in Hereford, where he resided (1380—1410), and who, having adopted the opinions of the Lollards, ultimately attained the reputation of a wizard; and Lewis Glyn Cothi, who flourished during the Wars of the Roses, and was bard to Jasper, Earl of Pembroke, son of Owen Tudor and the widow of Henry V.

Prose.—The oldest Welsh chronicler of the second period is Caradoc, a monk of Llanccarvan, who flourished in the first half of the 12th century. His work narrates in Welsh the history of his native country from the death of Cadwallader, 689, to the times of Caradoc himself. It is a dry, illiterate affair, like the Anglo-Saxon Chronicle. Contemporary with Caradoc was the famous Geoffrey of Monmouth (q. v.), Bishop of St Asaph, who died in 1154. He, however, though a Welshman, wrote in Latin, and belongs, therefore, rather to the general literature of England than to Welsh literature. His *Chronicle* commences with the fall of Troy, and ends with the death of Cadwallader, so that it forms an introduction to that of his friend Caradoc. In it the legend of Arthur first assumes that romantic and chivalrous form in which modern readers are familiar with it. It is impossible here to enter into a discussion of the question where the materials of the Arthurian romance were first accumulated; suffice it to say, that evidence preponderates in favour of their Welsh origin. To this second period must also be assigned that charming collection, the *Mabinogion*, or Children's Tales, of which a MS. volume of more than 700 pages is preserved in the library of Jesus College, Oxford, and is known as the *Red Book of Hergest*, from the name of the place where it was discovered. A beautiful edition of this work in Welsh and English, with preface and notes, was published in 3 vols. (1838—1849) by Lady Charlotte Guest. The age of these tales, which relate principally to Arthur and the Round Table, is doubtful. The transcription in the *Red Book of Hergest* belongs probably to the 15th c.; but the date of their composition may be safely held to be much earlier, perhaps somewhere in the 13th century.

The *Triads* may also be here noticed. They are

collections of historical facts, maxims ethical and legal, mythological doctrines and traditions, and rules for the structure of verse; all expressed with extreme brevity, and regularly disposed in groups of three. They were a very popular species of composition among the Welsh, and are of all ages. Examples occur in the poems of Llywarch Hen, but the greater part are found in transcripts and miscellanies of the 16th and 17th centuries. The 'historical' triads are especially puzzling. They occur in a so-called collection, made by one Thomas Jones of Tregaron, about the close of the 16th century. This Jones was originally, it seems, an eminent robber—a Welsh 'Rob Roy;' but in his later years he reformed, married an heiress, and became a justice-of-peace for the county of Brecon. The peculiarity of his 'Collection' is, that it gives a totally different account of the origin of the Britons from Geoffrey of Monmouth, bringing them from a 'Summer Land' (supposed to be Constantinople or the Crimea) over a sea called the 'Hazy Sea.' The question arises, and has not been settled: Whether are we to suppose Jones the fabricator of these 'triads,' or his account of the origin of the Britons the genuine record of an ancient tradition? In favour of the former hypothesis, unfortunately, is the circumstance that there is no trace of such an ancient tradition in the anterior literature of Wales.

Third Period (1536—1760).—This and the remaining period may be briefly sketched. The most notable fact in its commencement is the comparative ease with which the Reformation made its way among the Celts of Wales. The Celts of the Highlands remained for a time, and those of Ireland remain to this day, obdurate adherents of the old faith; but those of Wales, on the whole, swiftly accepted the new religion. The art of printing had been in operation in England for more than half a century before it was applied to the Welsh language. The first book printed in the Welsh or any Celtic language was an almanac, with a translation of the Lord's Prayer and the Ten Commandments (Lond. 1546). The author, William Salesbury, was a scholar and a zealous Protestant. In 1547, he published the first dictionary of English and Welsh, and executed the greater part of the first translation of the New Testament into his native tongue (Lond. 1567). In 1588, appeared the earliest translation of the whole Bible into Welsh. The author was a Dr William Morgan, afterwards Bishop of St Asaph's. A revised edition of this, in 1620, by Dr Parry, Morgan's successor in the bishopric of St Asaph's, is the translation still in use among the natives of the Principality. Contemporary with Salesbury, but an adherent of the old faith, was Dr Griffith Roberts, who lived on the continent, and published at Milan a Welsh Grammar in 1567. Another contemporary was Dr John David Rhys, whose principal work, *Cambrobrytanica Cymroecæ Lingua Institutiones et Rudimenta*, is a treatise on Welsh grammar. The suspicious Thomas Jones of Tregaron, possible author, rather than collector of the 'historical' triads, was a friend of Rhys, and died about 1620. In 1603, Captain Myddleton, one of the first three persons who smoked tobacco in England, published a metrical version of the Psalms in Welsh, partly executed while cruising about in the West Indies. The most celebrated poets of the third period are the Rev. Rees Prichard, vicar of Llandovery (1579—1644), whose *Canwyll y Cymry* (Candle of the Cambrians) is a metrical version of his professional homilies or sermons, the eloquence of which had previously won for him a great reputation as a preacher; it is still popular,

the 20th edition having appeared as late as 1858; Huw Morus, or Hugh Morris (1622—1709), author of a variety of pieces, which his countrymen consider unsurpassed in humour, pathos, and even sublimity—an edition in 2 vols. appeared at Wrexham (1823), under the title of *Eos Ceiriog* (The Nightingale of Ceiriog); and Goronwy Owen (1722—circa 1780), a gifted bard, but likewise an incurable drunkard, whose principal poems are contained in the first volume of a book entitled *Diddanuch Teuluaidd* (Domestic Amusement, Lond. 1763). Of the prose writers, the only noteworthy are Ellis Wynne (d. 1734), author of the *Bardd Cwsg* (Sleeping Bard, 1703), a series of visions of Hell and Hades, written with great beauty of style; and the Rev. Moses Williams (1685—1742), an antiquarian scholar of high merit, whose *Repertorium Poeticum*, or List of Welsh Poems and Catalogue of Welsh Books, is very valuable.

Fourth Period (1760—1867).—Various causes co-operated to give a new impetus to Welsh literature after the accession of George III. Among these, the most powerful were the establishment of periodical publications, the institution of patriotic societies, and the spread of Methodism. The first important production of this period is entitled *Some Specimens of the Poetry of the Ancient Welsh Bards translated into English* (Lond. 1764), by Mr Evans, curate of Llanvair Talyhaern, in Denbighshire. The next name deserving of mention is that of Owen Jones (1741—1814), who, though engaged in mercantile occupations all his life, managed, by his enthusiasm and liberality, to quicken and extend the public interest in Welsh literature. In 1771, he founded the *Gwyneddigion* (society of the 'Men of Gwynedd'), which gave prizes for the best performances on the Welsh harp, and the best Welsh poems. In 1801—1807, he caused to be published at his own expense, under the editorship of Owen Pughe and Edward Williams, three volumes of the *Myvyrian Archaeology*, so called in honour of himself, who had assumed the bardic name of Myvyr, from his native vale in Denbigh. Owen Jones was, however, rather a Welsh Mæcenas than a Welsh *littérateur*. The next names of importance are those of the editors just mentioned, Owen Pughe and Edward Williams. The former (1759—1835), according to Southey, was a 'muddy-minded man;' nor is the fact that he was a follower of Joanna Southcott, and one of her twenty-four elders, adverse to this description of his intellect. Be this as it may, Owen Pughe is the great Welsh lexicographer; his Dictionary of Welsh (1793—1803) contains 100,000 words illustrated by 12,000 quotations. He also translated *Paradise Lost* into Welsh, in which work he threw off the chains of Welsh alliteration, an innovation generally acknowledged to be an improvement. Edward Williams (1745—1826), better known as Iolo Morganwg, is probably the finest Welsh genius of the fourth period. Southey knew him, and liked him greatly. His principal productions are *Salmu yr Eglwys yn yr Anialuch* (Psalms of the Church in the Desert); but an *Ode on the Mythology of the Ancient British Bards in the Manner of Talesin* (1792), accompanied by notes and specimens of 'Triads,' containing the metaphysical and religious doctrines of the old Druidical bards, provoked a long-protracted controversy. Morganwg said that he had copied them from a MS. collection of a Welsh poet, anno 1560, which was in his possession, and affirmed that the collection was of very great antiquity. He was often asked to produce it, but always declined; and Welsh critics of the stricter sort have now ceased to believe in its existence. The three associates in the publication

of the *Myrrian Archaeology* had each one son, and all of these have become eminent in connection with the literature of their native country. Taliesin Williams (1787—1847), son of Edward Williams, wrote poetry both in Welsh and English; Aneurin Owen (1792—1851), son of Owen Pughe, among other works, published an important collection of the *Laws of Wales*; while Owen Jones, son of Owen Jones, the Welsh Mæcenas, is still alive, and has a high reputation as an architect, the Alhambra at Sydenham being a favourable specimen of his professional talents. The fourth period of Welsh literature is naturally richer in critical than in creative works. Among Welsh antiquaries may be mentioned the Rev. Edward Davies (1756—1831), author of *Celtic Researches* (1804) and *Mythology of the Druids* (1809); the Rev. Thomas Price (1787—1848), author of the *Hanes Cymru a Chenedl y Cymry* (1836—1842), a History of Wales and of the Welsh nation from the earliest times to the death of Llewellyn; an admirable work, comprehensive, critical, and literary (Price was an ardent and voluminous writer, contributing to no fewer than 15 periodicals at the same time); and the Rev. John Williams ab Ithel, rector of Llanymowddwy in Merioneth, and editor of the *Cambrian Journal*. In 1856, he edited, for the Welsh MS. Society, the *Grammar of Edeyrn, the Golden-tongued*, said to be composed about 1270; in 1860, the *Brut y Tyngrogiion*, or Chronicle of the Princes; and in 1861 (*et seq.*), *The Traditional Annals of the Cymry*, reprinted from the *Cambrian Journal*. Williams is a rather credulous and uncritical writer, but a scholar of undoubted merit. Probably the ablest Welsh scholar alive is Mr Thomas Stephens of Merthyr-Tydvil, a man at once patriotic and honest, enthusiastic and critical. To him, above all others, Englishmen desirous of obtaining some clear and credible knowledge of Welsh literature, ought to apply. His principal works are *Studies on British Biography, and Literature of the Cymry in the Twelfth and following Centuries*. The enlightened views of Stephens have met with great acceptance among such English scholars as have paid attention to the subject of Welsh history and literature.

The poetry of the fourth period is not remarkable. The principal names are—David Richards of Dolgelly (1751—1827), author of a sort of epic on the Trinity—a very unsuitable subject for an epic—and a paraphrase of the history of Joseph: David Thomas of Caernarvon (1769—1822), who was very successful at the Eisteddvods: David Owen of Givion (1784—1841), whose poems were collected and published under the title of *Blodau Arfon* (Flowers of Arvon): the Rev. Daniel Evans, a collection of whose pieces was published at Llandoverly in 1831, under the title of *Gwinllan y Bardd* (The Poet's Vineyard): the Rev. Walter Davies (1761—1849), also great at Eisteddvods: the Rev. James Hughes (1779—1846): the Rev. William Rees of Liverpool, author of a spirited paraphrase of the Book of Job, &c.: and the Rev. William Williams of Caernarvon, author of *Grawn Awen* (The Treasure of the Muse), &c.

A good deal of indifferent Welsh prose has been written during this period on religious subjects, owing to the spread of Methodism among the Welsh, but it may profitably be overlooked by a foreigner; and with a glance at the history of Welsh periodicals and societies, we close our brief survey of the subject. The first Welsh periodical, edited by the Rev. P. Williams and Evan Thomas, appeared about 1770, and was entitled *Yr Eurgrawn Cymraeg* (The Welsh Treasure), but the first that attained any measure of success was the *Seren*

Gomer (Star of Gomer), which was published at Swansea (1814). At present, it exists as a Welsh 'quarterly' of evangelical views. In 1831, *Y Drysorfa* (The Treasury) was commenced, under Calvinistic auspices; in 1836, *Y Dysgygiwr* (The Reformer), and *Y Dysgedydd* (The Teacher); 1833—1841, *Y Gwladgarwr* (The Patriot), more a literary than a theological magazine, and tolerably clever; *Yr Haul* (The Sun), a journal advocating the interests of the Established Church; and *Y Traethodydd* (The Essayist), commenced at Denbigh (1845), distinctly the best literary organ in Wales. It discusses, in the Welsh tongue, the poetry and philosophy of modern Europe. In 1859, a new quarterly was started at Ruthyn, entitled *Taliesin*, as a companion and rival to *The Essayist*. The leading Welsh newspaper is the *Amerau* (Times).

A work of great value, commenced in 1856, is a Welsh Encyclopædia, under the editorship of the Rev. John Parry of Bala, and entitled *Encyclopædia Cambrensis—Y Gwyddoniadur Cymreig*. Periodicals, exclusively devoted to Welsh subjects, are the *Cambrian Register* (3 vols., 1796, 1799, and 1818); the *Cambro-Briton and General Celtic Repository* (3 vols., 1819—1822); the *Cambrian Quarterly Magazine* (5 vols., 1829—1833); and the *Cambrian Journal*, begun in 1854, and still going on. Another valuable periodical is the *Archæologia Cambrensis*, or 'Journal of the Cambrian Archæological Association,' begun in 1846, and published quarterly.

The leading Welsh societies, literary and antiquarian, that have existed, or still exist, are the Cymmrodorion, established in London in 1751, which lived for 30 years; the Gwyneddigion, also established in London in 1771, but extinct some 20 years ago; a second Cymmrodorion (1820—1843); The Society for the Publication of Ancient Welsh MSS. (founded at Abergavenny, 1837); and the Cambrian Institute, founded in 1853.

The best work on Welsh literature, as already mentioned, is that of Mr Thomas Stephens of Merthyr-Tydvil, to which the reader is referred; as also to the various Welsh quarterlies, where almost every question in Welsh literature is copiously discussed. A very excellent and complete survey of the subject is also to be found in Knight's *English Cyclopædia*, article 'Welsh Language and Literature.'

WELSH ONION, or **CIBOL** (*Allium fistulosum*; see **ALLIUM**), a perennial plant, a native of Siberia. It has fistular leaves and no bulb. Its leaves appear very early in spring, and are then used in soups and salads. Its flavour more resembles that of garlic than of the onion. It has been long cultivated in kitchen-gardens in Britain, and perhaps deserves more attention than it receives, because it is ready for use before any similar plant in spring. The seed is sown in spring or summer; leaves fit for use are produced in the following spring, and the bed continues to be productive for a number of years. The name Welsh Onion is from the German *Walsch*, and merely indicates a foreign origin.

WELSHPOOL (often vulgarly called Pool), a municipal and parliamentary borough of North Wales, in the county of Montgomery (of which it is considered the capital), 18½ miles west-south-west of Shrewsbury. Powis Castle is an ancient edifice, the oldest parts dating from the 12th c.; and the park is much admired. Woollen mills, tanneries, and malt-houses are in operation. Pop. of parliamentary borough, (1861) 5004; (1867) 6000. W. is connected by a branch with the Shrewsbury and Hereford and other railways.

WENDS from the same root as to *wend*, to *wander*, and signifying the wandering or roving border tribes), the name given by the Germans to a branch of the Slaves (q. v.) which, as early as the 6th c., occupied the north and east of Germany from the Elbe along the coast of the Baltic to the Vistula, and as far south as Bohemia. They were divided into several tribes, which were successively subdued by the Germans, and either extirpated or gradually Germanised and absorbed, although remnants of them are still here and there to be found.—In a narrower sense, the name of Wends is given to those remnants of the Slavic population of Lusatia who still speak the Wendic tongue, and preserve their peculiar manners and customs. They number about 150,000. A collection of Wendic songs was published by Haupt and Smaler (2 vols., Grimma, 1843—1844). The Wends, like the other subject Slavic tribes, were, in early times, cruelly oppressed by their German masters; in recent times, their lot has been more tolerable.

WENER, LAKE, the largest lake in the Scandinavian peninsula, and after the lakes Ladoga and Onega in Russia, the largest in Europe, is situated 150 miles west-south-west of Stockholm, and about 30 miles inland from the Cattegat. It is over 90 miles in length, and varies from 15 to 48 miles in breadth, is 309 feet in greatest depth, and lies 150 feet above sea-level. Area, 2005 sq. miles. From the north shore a peninsula extends southward into the middle of the lake; and from the southern shore a peninsula extends northward to within about fifteen miles of the point of the northern peninsula; the portion of the lake lying to the west of these peninsulas receives the name of Dalbo Lake. Of the numerous rivers that feed the lake, the chief is the Klar, from the north, and its surplus waters are discharged into the Cattegat by the river Göta. It is connected by a canal with Lake Wetter, by means of which, the Göta Canal, Lake Roxen, &c., inland communication is established between the Cattegat and the Baltic Sea. The lake is rich in fish; it is often visited by sudden gusts of wind, and is in many places too shallow for navigation.

WENLOCK, a parliamentary and municipal borough in the county of Salop, 12 miles south-east of Shrewsbury. Pop. of parliamentary borough (1861), 21,590. The principal buildings in Much Wenlock are the church, a building of considerable antiquity, bearing traces of Saxon and Norman architecture; and the town-hall, a venerable and interesting structure, decorated internally with elaborate oak carvings of the time of Charles II. There are also a savings-bank, and a public library and reading-room. The extensive ruins of Wenlock Abbey afford a rich treat to antiquaries. The abbey was founded in the year 680, and was the parent church of Paisley Abbey, Scotland. The remains are now carefully preserved from further dilapidation by the present owner, J. Milnes Gaskell, Esq., M.P. for the borough, who has converted a portion into an occasional residence for himself. W. is an ancient municipality, with separate quarter sessions, and is the first borough that acquired the right by charter of representation in parliament. The town of Wenlock proper, or Much Wenlock, is but small; but the parliamentary borough comprises 12 parishes spreading over a large area, and includes the market-towns of Madeley, Broseley, and Ironbridge, and the populous district of Coalbrookdale, where important iron and brick and tile works are carried on. There are also extensive limestone quarries in the neighbourhood. There is a railway connecting W. with the Severn Valley Railway at Buildwas, and

another connected with the Shrewsbury and Hereford line.

WENLOCK GROUP, an important series of rocks of Upper Silurian age, which are largely developed in the neighbourhood of Wenlock. The group is divided into an Upper and Lower series. The Upper, known as the Wenlock Limestone, consists of a considerable thickness, sometimes reaching 300 feet, of a gray subcrystalline limestone, so hard that it has withstood the weathering which has removed the softer shales above and below it. It forms a ridge parallel to that of the Aymestry limestone, running for 20 miles north-east to south-west through the south-eastern portion of Shropshire. Sometimes it contains huge concretionary masses of crystalline carbonate of lime, locally named 'ball-stones'; in other places, it becomes thin and flaggy. It abounds in fossils, especially in corals, crinoids, mollusca, and trilobites. The Lower Wenlock series consists of 1400 feet of Wenlock shale, and 150 feet of Woolhope limestone and grit. The Wenlock shale is generally a dark gray, almost black argillaceous rock, often containing elliptical concretions of impure earthy limestone. It is worked in some places for flagstones and slates. The Woolhope limestone and grit consists of gray argillaceous nodular limestones resting on fine shales. In Denbighshire, it appears as a coarse grit, often of great thickness, and producing a very barren soil. The fossils of the Lower Wenlock beds are of a similar character to those of the Upper series.

WENS are encysted tumours, much more common on the scalp than in any other situation, though occasionally observed on the face, shoulders, &c., and consisting of obstructed sebaceous glands, which enlarge by the internal pressure of their accumulated secretions. The closed orifice may be often noticed in the form of a small dark point, and in that case the duct may sometimes be gradually enlarged by the gentle introduction of a probe or director, and its contents pressed out. By this treatment, they may, at all events, be kept from being unsightly, and will sometimes shrivel up and disappear. If this treatment fail, and the patient finds the tumour so annoying that he insists upon its removal, it must be exterminated with caustic or the knife. In consequence of the well-known dangers (especially erysipelas) that frequently follow cutting operations of the scalp, the caustic treatment is generally preferable. The most prominent part of the wen must be thoroughly cauterised with nitric acid or potash, which will lead to the formation and separation of a slough, which will lay open the tumour, which may then be left to empty itself and wither, or may be emptied by pressure, and cauterised within. As a general rule, wens are better left alone, unless they can be emptied by simple pressure, as severe operations on them are frequently attended with danger.

WENTLETRAP (*Scalaria*), a genus of gasteropodous molluscs, of the family *Turritellida*. The shell is spiral, with many whorls, the whorls deeply divided, and not always close together, crossed by remarkably elevated ribs, the aperture round and rather small. The animal is furnished with a proboscis, and has the eyes placed on an external convexity, the foot short and oval. About one hundred species of this genus are known. Those which have the whorls close together are called False Wentletraps by shell-collectors, those in which they are not contiguous are known as True Wentletraps. Of the former, some are found in northern seas, as *Scalaria communis* on the coasts of Britain and of continental Europe, and *S. Greenlandica* on those of North America. *S. Greenlandica* is particularly

abundant on the banks of Newfoundland, and forms part of the food of the cod. The *true* Wentletraps are all natives of the seas of warm climates. Some of them are very beautiful. A species found in the south-east of Asia, and known as the PRECIOUS W. (*S. pretiosa*), was once in such esteem amongst shell-collectors, that an extremely fine specimen is

Wentletrap (*Scalaria pretiosa*).

said to have been sold for 200 guineas; and an ordinary price was from three to five pounds. This shell may now be purchased for a few shillings. It is from an inch and a half to two inches long, snow-white, or pale flesh-coloured, with eight separated—but not widely separated—whorls.

WERDAU, a town of Saxony, on the river Pleisse, 40 miles directly south of Leipzig, and 49 by railway. Pop. 8436, mostly engaged in manufacturing cloth and in yarn-spinning.

WERDEN, a town of Rhenish Prussia, on the Ruhr, 17 miles north-east of Düsseldorf. Pop. (1861) 5775, employed in the manufacture of cloth, linen, and silk, and alum, and coal-mining.

WEREGILD (Ang.-Sax. *wer*, man; and *geld*, satisfaction), a composition by which, according to the custom of the Anglo-Saxons, Franks, and other Teutonic people, homicide and other heinous crimes against the person were expiated. There was an established progressive rate of weregild for homicide, varying at different times and among different Teutonic tribes, from the weregild of the *ceorl*, or peasant, to that of the king. In the time of Tacitus, the weregild for homicide among the Germans was due to the relatives of the deceased; that for other crimes one-half to the injured party, and one-half to the state. The sum paid to the relatives in case of homicide, also known as the *man-wyrth*, seems to have been looked on as the equivalent of the dead man's value. As the power of the community or king increased, the exaction of retribution for the death of its members was considered to be the duty of the state as well as of the relatives, and the principle of division was applied to homicide as well as minor crimes; each payment being a separate full equivalent for the value of the deceased, the one to appease the feud, the other to make atonement to the state. This double weregild is recognised in the compensation for the death of a king by the laws of the Mercians and Northumbrians. In the days of Edward the Elder the weregild had become a much more complicated penalty, the composition for homicide consisting of four different payments, two of which, the *fight-wite*, or penalty for a breach of the peace, and the *weregild*, went to the king as head of the state; while a sum called the *halsfang* was paid to the kindred to loosen the hand of the avenger of blood,

and the *manbote* was given to the overlord to compensate him for the loss of a vassal. The graduated scales of weregild in use among the different Teutonic nations throw much light on the gradations of society at the period. It does not appear that among the nations who recognised the principle of weregild, the relatives were bound to accept a compensation for their kinsman's slaughter, in place of appeasing the death-feud by blood; the latter practice was often resorted to instead. It was only through the exertions of Archbishop Theodore that Egfred, the Christian king of the Angles of Northumbria, adopted the alternative of accepting a weregild for his brother slain in battle by the Mercians, in place of demanding the blood of the slayer. A similar principle to that of weregild for homicide seems to have been recognised by the Celtic nations, and there are traces of it in the Mosaic code.

WERE-WOLF (Ang.-Sax. *wer*, a man), a man-wolf, a man who, either periodically or for a time, is transformed, or transforms himself into a wolf, becoming possessed of all the powers and appetites of a wolf in addition to his own, and being especially remarkable for his appetite for human flesh. The belief in the transformation of men into wolves or other beasts of prey has been very widely diffused; there is perhaps no people among whom some evidence of its former prevalence does not exist. It is not yet extinct, even in Europe. In many of the rural districts of France, the *loup-garou* (the latter part of the word is a corruption of the Teutonic *wer-wolf*), is still an object of dread. This superstition lingers too among the country-people of Northern Europe, and a particular form of it flourishes vigorously among the Bulgarians, Slavonians, and Serbs, and even among the more intelligent inhabitants of Greece. See VAMPIRE. Its details vary in different countries and districts. The definition given above includes only the commonest and the best marked of its incidents. Probably, it has not yet entirely disappeared in any country whose rural districts are infested with wolves or other wild animals; and manifestations fitted to suggest it may be occasionally observed in the mad-houses of most countries. See LYCANTHROPIA. The animal whose shape is taken, as already stated, is not always, though usually, a wolf; it was probably always the animal most formidable, or considered most inimical to man. In Abyssinia, it is the hyæna.

Occasional notices of lycanthropy, as it is called, are found in classical writers; and lycanthropy, as there described, was the change of a man or woman into a wolf, so as to enable the man or woman to gratify an appetite for human flesh, either by magical means, or through the judgment of the gods, as a punishment for some dire offence. Sometimes the transformation was into the shape of a dog or a bull. Ovid, in his *Metamorphoses*, tells the story of Lycaon, king of Arcadia, who, when entertaining Jupiter at a banquet, resolved to test his omniscience by serving up to him a hash of human flesh. The god, to punish him for this, transformed him into a wolf. Herodotus describes the Neuri as sorcerers who had the power of taking once a year, for several days, the shape of wolves; and the same account of them is given by Pomponius Mela. Pliny relates that, in Arcadia, every year, at the festival of Jupiter Lycaeus, one of the family of Antæus was chosen by lot, and conducted to the brink of the Arcadian Lake, into which, after having hung his garments upon a tree, he plunged, and was transformed into a wolf. Nine years after, if alive, he returned to his friends, looking nine years older than when he disappeared. Some notices of lycanthropy are to be found in Petronius; and

allusion to it is also made by Virgil in the 8th *Eclogue*. Marcellus Sidetes tells us of men who, every winter, were seized with the notion that they were dogs or wolves, and lived precisely like these animals, spending the night in lone cemeteries. This disorder attacked men chiefly in the beginning of the year, and was usually at its height in February. It is worth while observing that the classical instances of lycanthropy mostly refer to Arcadia, a pastoral country, whose inhabitants suffered greatly from the ravages of wolves.

In Norway and Iceland, it used to be believed that there were men who were 'not of one skin.' Such men could take upon themselves other shapes than that of man, and the natures corresponding to the shapes which they assumed; they had the strength and other powers of the animal whose shape they bore, as well as their own. It was believed that the change of shape might be effected in one of three ways: simply by putting on a skin of the animal; by the soul of the man deserting the human body—leaving it for a time in a cataleptic state—and entering into a body borrowed or created for the purpose; or, without any actual change of form, by means of a charm, which made all beholders see the man under the shape of the animal whose part he was sustaining. The two former were the common modes of transformation; at any rate, the Sagas are full of illustrations of them; while illustrations of the third mode are comparatively rare. Nothing of the man remained unchanged except his eyes; by these only could he be recognised. Odin had, and freely exercised, the power of varying his shape. When men changed their shape to prey upon their kind, they always took the form of a wolf. It was believed that many had the power of thus transforming themselves; and great was the popular dread of were-wolves. Perhaps the best stories of were-wolves which are to be found are contained in the Northern Sagas. Scarcely anywhere did the belief in them go so deep into the minds of the people as among the northern races. In connection with it, notice may be taken of what is called the 'Berserkr rage,' which appears to have been a peculiar form of mania. The Berserkr yelled like dogs, or wolves rushing into conflict, bit their shields with their teeth, and committed terrible atrocities while the paroxysms of their disease were upon them. Berserkr has been rendered 'bare-skinned;' others make it mean 'wolf-skin-coated' (why not 'bear-skin-coated?').

Olaus Magnus states that in Prussia, Lithuania, and Livonia, though wolves were very numerous and troublesome, the ravages of the were-wolves were regarded as much more serious. Every year at the feast of the Nativity at night, the were-wolves assembled in great numbers at appointed places, and proceeded to look out for human beings, or tame animals, upon which they could glut their appetites. If they found an isolated house, they entered it, and devoured every human being and tame animal it contained; after which—abewing that they were not common wolves—they drank up all the beer or mead. Similar testimony with regard to Livonia is given by Bishop Majolus, who adds, that the transformation into the wolf-form continued for twelve days.

Instances of persons being changed into wolves by way of punishment, were freely believed in the middle ages; for example, St Patrick was believed to have changed Vereticus, king of Wales, into a wolf; and there was an illustrious Irish family which had incurred the curse of St Natalia, every member of which, male and female, according to the popular belief, had to take the shape of a wolf, and live the life of a wolf for seven years.

In the 15th and 16th centuries, the belief in were-wolves was, throughout the continent of Europe, as general as the belief in witches, which it had then come to resemble in many respects. It gave rise to prosecutions almost as frequent as those for Witchcraft (q. v.), and these usually ended in the confession of the accused, and his death by hanging and burning. It was calculated to inspire even greater terror than witchcraft, since it was believed that the were-wolves delighted in human flesh, and were constantly lying in wait for solitary travellers, and carrying off and eating little children. The were-wolves, like the witches, were now regarded as servants of the devil, from whom they got the power—often exercised by anointing with a salve—of assuming the wolf's form; and it was believed that great numbers of them trooped together to the devil's Sabbath. The stories of mutilations and other mishaps befalling them in the wolf-state, by which, when they resumed the human form, they were identified as were-wolves, exactly resemble the stories told of witches. In September 1573, we find a court of parliament sitting at Dole, in Franche-Comté, authorising the country-people to take their weapons, and beat the woods for a were-wolf, who had already—thus went the recital—'carried off several little children, so that they had not since been heard of, and done injury to some horsemen, who kept him off only with great difficulty and danger to their persons.' Throughout Europe, the judicial cognizance of witchcraft and of lycanthropy ceased at the same time. In Great Britain, where wolves had early been exterminated, the were-wolf was only known by rumours coming from abroad; but the belief that witches could transform themselves into cats and hares, which did prevail, was precisely analogous to the belief in were-wolves, especially in its later forms.

The later forms of this strange belief were obviously sophisticated. In its earlier shape, three things are to be noticed—the power ascribed to the were-wolf of transforming himself, either by changing the shape of his own body, or projecting his spirit into another body; his appetite for human flesh; his taking the shape and nature of the animal held to be most malicious against man—the wolf. As to the first of these, all that can here be done is to point to its connection with the doctrine of Transmigration (q. v.), and to add that it has been one of the commonest of human beliefs. As to the second, is it unlikely that in the early times in which the superstition had its origin, the appetite for human flesh may have been common enough to spread terror through whole districts? It is, at least, not improbable that every race of men has had an experience of cannibalism; and it may well have been that, in occasional cases, especially under conditions of disease, the taste for human flesh survived the general practice of using it. Modern Europe affords many unquestionable examples of this taste existing and being indulged in the midst of comparative civilisation. There can be no doubt that some of the unhappy multitude put to death as were-wolves had really murdered and eaten the flesh of human beings. But secret murders, unaccompanied by cannibalism, would tend to support a popular belief in cannibalism. We have not to go out of our own age for proofs of the existence of men afflicted with a homicidal tendency; and in times when the means of detecting crimes were very imperfect, it is conceivable that the murders committed by one or two such persons would spread terror, and give support to a superstitious theory throughout a large district. The Maréchal de Retz, who lived in the time of our Henry VI., had caused

to be stolen and put to death by torture, under the most inhuman circumstances, many hundred children—he confessed on his trial that he murdered 120 in a single year. (A memoir of Gilles de Laval, Maréchal de Retz, has been compiled from authentic documents by P. J. Lacroix, the eminent French antiquary.) Perhaps no society has ever been free from men similarly constituted, and acting similarly according to their opportunities. As to the third point, if it be granted that a certain practice of, or general suspicion of cannibalism existed among a people who believed in the power of transformation, it is easy to understand how the cannibal, getting his victims by stealth, was supposed to indulge his inhuman appetite under the guise of the animal most unfriendly to man. And the existence of a form of mania in which the madman had the hallucination that he was changed into a wolf, yelled like a wolf, lived in many respects like a wolf, was calculated strongly to confirm the belief in men-wolves. In conjunction with the mischief done by real wolves, this itself may be thought almost enough to have given origin to the superstition. The hallucination of having undergone transformation into a wolf from time to time, seems to have been one of the commonest by which weak and crazed brains were possessed during the period when the hunt for werewolves was kept up. The literature of this subject, though abundant, is for the most part fragmentary, and mixed up with other matters. A good account of the subject will be found in *The Book of Werewolves*, by Sabine Baring-Gould (Lond. 1865).

WERNER, ABRAHAM GOTTLIEB, a celebrated mineralogist and geologist, born at Wehrau, on the Queiss, in Upper Lusatia, September 25, 1750. His father was director of a smelting-work, and he was thus led almost in childhood to the study of minerals. After some time spent at the Mineralogical Academy of Freyberg, he went to Leipzig, where he studied natural history and jurisprudence. Here, at the age of 24, he published his first work on mineralogy, a mere pamphlet on the external characters of minerals. In 1775, he was appointed Professor of Mineralogy, and curator of the Mineralogical Cabinet at Freyberg. In 1780, he published the first part of a translation of Cronstedt's *Mineralogy*, in his notes to which he gave the first outlines of the system which bears his name. In 1791, he published a *Theory of the Formation of Metallic Veins*, which was translated into English and French, and greatly extended his reputation. He was not, however, a voluminous author, but his views were diffused by his pupils, among whom were the most eminent German mineralogists of the time. In 1792, he was appointed Councillor of Mines in Saxony. He died at Dresden in 1817.

W.'s influence was very great in the promotion both of mineralogy and of geology. In his mineralogical system, minerals were distinguished and arranged chiefly according to their external characters; and mineralogists have now learned to depend much more than he did on their chemical constitution. In geology, he did great service by arranging the facts already known, and guiding to proper methods of observation. His theory was extensively received for a time. It may be described as the opposite of the Huttonian theory, accounting for the present state of mineral substances in general by supposing them to have been dissolved or suspended in water; whilst the Huttonian theory ascribed almost everything to the action of fire. W.'s is sometimes called the Neptunian theory, whilst that of Hutton is styled the Plutonic. Modern geology recognises a certain measure of truth in both, but rejects them alike in that character of completeness or universality in which

they were once advocated. W. classified rocks into Primary, Transition, and Secondary; and the terms are still sometimes used, although merely as convenient names, not as indicative of opinions concerning the rocks designated by them.

WERNIGERODÉ, a small walled town of Prussia, in the government of Magdeburg, and 43 miles south-west of the city of that name, stands at the northern base of the Brocken Mountain. Its castle, the residence of the Counts Stolzburg-Wernigerode, comprises a library of 40,000 volumes, and a zoological garden. It manufactures linen, cloth, and tobacco; and carries on copper-smelting and paper-making. Pop. 5572.

WESEL, a strongly fortified town of Prussia, on the Rhine, 32 miles north-north-west of Düsseldorf. The Rhine, which here is joined by the Lippe, is divided by a fortified island, and crossed by a bridge of boats, protected on the left bank by a fort. Of its churches, the Willibrod Kirche was first opened in 1181. Cloth, hosiery, serge, leather, hats, tobacco, and linen are manufactured, and book-printing is carried on. The citadel is defended by about 4500 men. Pop. (1861), exclusive of garrison, 13,597.

WESER (Lat. *Visurgis*), a river of Germany, formed out of the Werra, which rises in the Thuringerwald, and the Fulda, rising in the Rhöngebirge, on the frontiers of Prussia and Bavaria. These streams, after a northern course, unite at Münden, in Hanover; and the united stream, the W., flows north through Prussia, till, passing Bremen, it forms for about 40 miles the boundary between Oldenburg and Prussia, and enters the North Sea by a wide but shallow estuary, much interrupted by sand. Entire length, 260 miles. It communicates with the Elbe by a navigable canal; but though considerably improved in this respect, the W. is not of much use as a navigable stream. The principal trading-town on its banks is Bremen.

WESLEY, JOHN, the founder of the Methodists (q. v.), was born at Epworth, in Lincolnshire, England, 17th June 1703. The family name was variously spelled Wesley and Westley, and is supposed to be the same with Walleley, and to be derived from a place of that name near Wells. An Irish gentleman, Garrett Walleley, Esq., of Dunganon, offered to make Charles Wesley, younger brother of John, his heir, on condition of his settling in Ireland, believing him to be of his own family. The offer was not accepted; and the estate of Mr Walleley went to another branch of the family, which was soon raised to the Irish peerage, with the title of Earl of Mornington, and from which the Duke of Wellington and the Marquis of Walleley sprung. The more immediate progenitors of John W. were ministers of the church of England, of Puritan principles. Some of them suffered for non-conformity. Bartholomew Wesley, the great-grandfather of John, was ejected from his living by the Act of Uniformity in 1662. John Wesley, the son of Bartholomew, was also deprived of his living, and was often fined, and several times imprisoned for preaching contrary to the law. Samuel Wesley, a son of this John Wesley, conformed to the Church of England, but opposed the schemes of James II., refusing to be bribed by offers of preferment, which, on account of his erudition and talents, it was thought worth while to make to him. He supported the cause of the Revolution, in circumstances of personal danger, and in the beginning of the reign of William and Mary, was rewarded with the living of Epworth. He wrote an epic poem entitled *The Life of Christ*, and other similar works. He had a family of nineteen children. His wife, Susannah

Annealey, the daughter of an ejected minister, was a woman of remarkable intelligence and fervent piety, who devoted herself very much to the education, and particularly the religious education, of her children. His eldest son, Samuel, head-master of Tiverton school in Devonshire, was a Tory and High-Churchman, who strongly disapproved of the 'new faith' and peculiar course of his brothers John and Charles. John W. was the second son of Samuel, or the second who grew up to manhood. In his infancy, he had a narrow escape from being burned to death, when the parsonage of Epworth was burned by some of the parishioners in their rage against their pastor for his faithful reproof of their vices. Another remarkable story is connected with the parsonage of Epworth, and with the early years of John W.'s life—the continued disturbance of the family, throughout a considerable time, by loud knockings and other noises, which could not be accounted for, and which therefore were regarded as preternatural, although Mr Wesley and his household were less affected by the strange visitation than perhaps its authors expected them to be, and persisted in residing in the parsonage, even making sport of 'Old Jeffery,' their unseen visitant, who 'was plainly a Jacobite goblin, and seldom suffered Mr Wesley to pray for the king and the Prince of Wales without disturbing the family prayers.'

John W. was a very diligent and successful student. The religious history of his college life belongs to the history of Methodism (q. v.). After much conscientious hesitation as to his motives and fitness for entering into the clerical profession, he was ordained deacon in 1725, and in 1726 he graduated as M.A., and was elected fellow of Lincoln College, Oxford. In the same year he was appointed Greek lecturer and moderator of the classes. He became curate to his father at Wroote, a small living which Samuel W. held along with that of Epworth, and whilst serving here, he was advanced to priest's orders in 1728. He returned to Oxford, and along with his younger brother, Charles, entered into those religious associations from which Methodism sprang. The intercourse of the brothers Wesley at this time with William Law, the author of the *Serious Call*, had a great influence on their opinions and conduct. They walked two or three times a year from Oxford to visit Law at his house near London. In 1735, John W. was induced to go out to Georgia with General Oglethorpe, to preach to the Indians and colonists. His religious views at this time were strongly tinged with asceticism. His intercourse with Moravians, who were his fellow-passengers to America, and afterwards his fellow-labourers in the colony, tended to stimulate his religious zeal. He attempted to establish a discipline in the colony, very different from that of the Church of England at home, and failed in the attempt. The difficulties of his position were increased by an affair in which he became involved with the daughter of the chief magistrate of Savannah, whom he wished to marry; but on the advice of the Moravian bishop and elders, to whom he submitted the matter, he withdrew from her, and she very soon marrying another, W. refused her admission to the communion; upon which her husband raised an action at law, and W., finding Savannah no suitable place for him, and, as he said, 'shaking the dust off his feet,' returned to England, having resided in America not quite two years. With religious zeal undiminished, he maintained an intimate connection with the Moravians in London. On 24th May 1738, some months after his return to England, he attended a meeting of a society in Aldersgate Street, where, whilst one was reading Luther's preface to the Epistle to

the Romans, he experienced such a change of religious feeling that, notwithstanding all his previous zeal, he ever afterwards regarded this as the time of his conversion. 'I felt my heart strangely warmed,' he says; 'I felt I did trust in Christ, Christ alone, for salvation; and an assurance was given me, that He had taken away my sins, even mine, and saved me from the law of sin and death.' Many who accept generally Wesley's views of conversion, doubt his opinion as to the date of his own. After this, he visited the Moravian brethren at Herrnhut in Germany, made the acquaintance of Zinzendorf, and was introduced to the Prince Royal of Prussia, afterwards Frederick the Great. Returning to England, he became associated with his old college companion, Whitefield, and after his example began, in 1739, the practice of open-air preaching. From this time, the history of Wesley's life becomes very much the history of Methodism. In 1740, he solemnly separated himself from the Moravians, finding that he differed from them on important points of doctrine; and in the same year the breach took place between Whitefield and him, which divided the Methodists into two sections, Calvinistic and Arminian. In the evangelistic work which he carried on in England, and in organising the Methodist body, W. was indefatigable. He seldom travelled less than forty miles a day, usually on horseback, till near the close of his life, when he used a chaise. In 1752, he married a widow with four children, but the marriage proved an unhappy one, and a separation ensued. His health gradually declined during the last three years of his life, and after a short illness, he died in London, 2d March 1791, in the 88th year of his age. His remains lay in state for several days in his chapel in the City Road, dressed in the sacerdotal robes which he usually wore, with a Bible in his hand. W. was a voluminous writer. His writings are chiefly polemical and religious. His style in the pulpit was fluent, clear, and argumentative, not impassioned like Whitefield's; his countenance was mild and grave; and his manners agreeable, although he exercised a very imperial domination over the preachers of the Methodist body. He was a man of great benevolence, and gave away all his living to the poor. Probably no man ever exerted so great an influence on the religious condition of the people of England as John W., and his influence has extended to the most remote parts of the world.

—CHARLES WESLEY, his younger brother, born at Epworth, 18th December 1708, was associated with him in the whole Methodist movement. Having studied at Christ Church, Oxford, and visited Georgia at the same time with his brother, he took an active part in the subsequent work in England. He was a clear and simple preacher, and a man of fervent piety, but of a disposition very far removed from asceticism. He is the author of a great number of hymns in use among the Methodists; some of which, however, are among the best and most admired hymns in the English language, replete with pious feeling, and of lyrical power and sweetness almost unsurpassed.—See *The Works of the Rev. John Wesley* (16 vols., Lond. 1809); *Life of the Rev. John Wesley, A.M.*, by Dr Coke and Mr Moore (Lond. 1792); and *The Life of Wesley, and the Rise and Progress of Methodism*, by Southey (2 vols., Lond. 1820; new edition in Bohn's Standard Library, Lond. 1864).

WESSEL, JOHANN, called also *Gansfort*, a predecessor of Luther, was born at Gröningen, 1419, taught philosophy at Cologne, Louvain, Heidelberg, and Paris, and died (1489) in his native town. On account of his learning, he was called *Lux Mundi* (Light of the World); while his enemies, on account

of his opposition to the scholastic philosophy, termed him *Magister Contradictionum* (Master of Contradictions). In his doctrine of justification by faith, he forestalled Luther, who esteemed him very highly. After his death, a large portion of his writings were burned as heretical. Another portion appeared under the title of *Farrago Rerum Theologicarum*, of which Luther published an edition with a preface (Wittenb. 1522), but the most complete edition is that by Joh. Lydius (Amst. 1617). See Ullmann's *Joh. Wessel., ein Vorgänger Luther's* (Hamb. 1834), and Bähring's *Das Leben Joh. Wessel's* (Bielef. 1846).

WESSEX. See HEPTARCHY.

WEST, BENJAMIN, Anglo-American painter, was born at Springfield, Pennsylvania, October 10, 1738, of Quaker parentage, and with lack of opportunity or encouragement, surprised his friends by his skill in drawing at the age of seven years, and at nine painted a picture in water-colours, which, in some points, he declared in after-life, he had never surpassed. His first colours were made from leaves, berries, &c., and his brushes stolen from a cat's tail. Thus self-taught, at the age of 16 he practised portrait-painting in the villages near Philadelphia, and painted for a gunsmith his first historical picture, 'The Death of Socrates.' While the Society of Friends were discussing the propriety of his becoming a painter, he shocked their principles still more by volunteering in a military expedition to search for the remains of Braddock's army. At 18, he was painting portraits in Philadelphia, and later at New York, where, in 1760, he was aided by some generous merchants to go and pursue his studies in Italy. At Rome, he was patronised by Lord Grantham, whose portrait he painted, became the friend of Mengs, and, as the first American artist ever seen in Italy, attracted much attention. He painted his 'Cimon and Iphigenia,' and 'Angelica and Medora,' and was elected member of the Academies of Florence, Bologna, and Parma. In 1763, visiting England on his way to America, he was induced to remain in London, and in 1765 married Eliza Shewell, to whom he had been engaged before leaving America. His 'Agrippina landing with the ashes of Germanicus,' attracted the attention of George III., who was his steady friend and patron for forty years, during which time he sketched or painted 400 pictures. His 'Death of General Wolfe,' painted in the costume of the period, against the advice of all the most distinguished painters, effected a revolution in historic art. For the king, he painted a series of 28 religious pictures for Windsor Castle. His best-known works are 'Christ healing the Sick,' 'Death on the Pale Horse,' and the 'Battle of La Hogue.' In 1792 he succeeded Sir Joshua Reynolds as the President of the Royal Academy, but declined the honour of knighthood. Through his whole career, he was the generous friend, adviser, and patron of young artists. *The Life and Studies of Benjamin West* were compiled from materials furnished by himself, by John Galt, in two parts (Lond. 1816—1820); and a biography of him is also given in Cunningham's *Lives of Eminent British Painters*. He died in London, March 11, 1820, and was buried with great pomp at St Paul's Cathedral. His wife died 1817. Two sons survived him.

WEST BROMWICH, a large and rapidly increasing town of South Staffordshire, one of the most important towns in the great manufacturing and mining district known as 'The Black Country,' five miles north-west of Birmingham. A few years ago, W. B. was a mere village on a barren heath, and it owes the rapidity of its growth mainly to the rich

mines of coal and iron in the vicinity, and to the industries to which these give rise. Very many canals, and three railways, run through the parish. There are numerous churches, schools, and other important establishments. There are very large glass-works and also gas-works in the town: much of the gas used in Birmingham, as well as all that supplied to W. B., Wednesbury, and many other towns in the vicinity, being made here. The manufactures of iron-wares of all kinds, as gun and pistol barrels, locks, swords, fire-irons, fenders, &c., and of all kinds of hollow-wares, as kettles, sauce-pans, &c., are among the great branches of industry. Pop. (1861) 41,774.

WESTBURY, a small and ancient parliamentary borough of Wiltshire, 20 miles north-west of Salisbury, and on the western declivity of the Salisbury Plain. Its church, a tasteful edifice, was erected—the older parts at least—in the 13th century. For the most part uninteresting in itself, W. stands in the midst of a locality interesting from its many antiquities. W. is a station on the Wiltshire and Somerset Railway. Pop. (1861) 6495, chiefly employed in agriculture, the manufacture of woollen cloth of a superior quality, and the smelting of iron ore, some extensive mines of which have lately been discovered near the town, and which afford employment to many hands.

WESTCHESTER, a beautiful town, in a rich agricultural district of Pennsylvania, U. S., 23 miles west of Philadelphia, with elegant residences, a granite court-house, a white marble bank, 8 churches, an academy, a state normal school, and 2 public libraries. Pop. (1860) 4757.

WESTERN AUSTRALIA, a British colony, and the western section of the great island-continent of Australia, embraces the whole of that island west of the 129th meridian. Its extreme length from north-east to south-west is 1370, its average breadth is 650 miles, and its area is estimated at 978,000 sq. miles. Pop. (1863) 18,780, including military and convicts, and exclusive of aborigines. Revenue (1863), £71,708; expenditure, £71,073. This colony was formed in 1829, and in 1851 had only 5886 inhabitants; but within recent years a considerable number of emigrants have been sent out under the auspices of the Government Emigration Board. W. A. was formerly named *Swan River Settlement*, from the river Swan, which joins the Indian Ocean, after watering a considerable district in the extreme south-west. Of the whole vast area, this district in the south-west is now, as formerly, the only portion inhabited. There, mountain-ranges rising in elevation from the coast inland, run parallel with each other from south to north; the highest summit being 5000 feet above sea-level. The climate is agreeable and salubrious; the soil, both on the coast and in the interior, is light and dry. Bands of fertile land, where the sandal-wood and other trees grow abundantly, and which are suitable for the culture of the vine, olive, and fig, occur in the middle districts of the country. Rivers, of which the Swan is the chief, abound; but are not of much use for navigation. Magnetic iron ore, lead, copper, and zinc ores are found in large quantities, and there is a band of coal extending over 600 miles. The number of vessels which entered in 1863 was 91; tonnage, 48,058; cleared, 87; tonnage, 46,219. Imports in 1863 (chiefly sugar, tea, tobacco, spirits, beer, soap, ironmongery, and clothing of various kinds) amounted to £157,137; exports (chiefly wool, timber, copper ore, horses, and whale oil), £143,106. The capital is Perth, and there are several smaller towns. The colony became (1849), at the request of the colonists, a settlement for convicts, and has much

Printed in Calcutta by W.E.M. Taylor, Edinburgh St.

WEST INDIA ISLANDS

benefited by their labour, a great extent of road, and many bridges, jetties, landing-places, and public buildings, having been constructed by them. It is now the only colony to which Convicts (q. v.) are sent.

WEST INDIES are already described under **ANTILLES** (q. v.). See also the names of the islands themselves—Jamaica, Cuba, Martinique, &c.; as well as the European countries that possess them—Great Britain, Spain, France, Netherlands, &c.

WESTMACOTT, SIR RICHARD, R.A., an eminent sculptor, the son of Richard Westmacott, also a sculptor in his day of some little note, was born in London in 1775. His predilection for art was early manifested, and was carefully cherished by his father. He received as a youth the best education which London could then furnish, and in 1793 he proceeded to Rome to complete his studies. Here he became in some sort a pupil of the celebrated Canova, who shewed him much kindness and attention. His progress was rapid, and he distinguished himself by carrying off the highest prizes offered to the competition of the rising geniuses of the day, in particular a gold medal given by the Pope. In 1797, having, meantime, in recognition of his talent and promise, been elected a member of the Academy of Florence, he returned to London, where, shortly after, he was married to a daughter of a Dr Wilkinson, then of some medical celebrity. His success in his art was not for a moment doubtful, and very soon he found himself in full employment. In 1805 he was elected an Associate of the Royal Academy; in 1816 he was advanced to the full dignity of Academician; and in 1835 the University of Oxford recognised his eminence by conferring upon him the honorary degree of D.C.L. Two years afterwards, the honour of knighthood was bestowed on him. Previously, in 1827, he had succeeded Flaxman as Professor of Sculpture at the Academy, in which capacity he continued to officiate till his death, which took place on September 1, 1856. The works of Sir Richard W. by which he is chiefly known are public monumental statues, in some of which he had much success. Of these it may suffice to mention his statues in Westminster Abbey of Pitt, Fox, Perceval, and Addison, with the monuments to Sir Ralph Abercromby and Lord Collingwood in St Paul's Cathedral. Many of his works in the antique classical manner, are also of exquisite beauty and finish.

WESTMACOTT, RICHARD, R.A., son of the foregoing, was born in London in 1799. After being carefully educated under his father in the art which might seem to run in the family blood, he was sent to Rome in 1820 to prosecute his studies further. In Italy he passed six years; and after his return to London, he gradually won a reputation for himself as one of the ablest sculptors of the day. Besides being eminent in his art, he has likewise made himself known as a man of considerable literary and general attainment; and in 1837 he had the honour to be elected a Fellow of the Royal Society. In the year following, the Academy recognised his more special claims by assuming him as an Associate; and in 1849 he attained the rank of Royal Academician. On the death of his father, he was appointed to succeed him in the Professorship of Sculpture, a post which he is understood to fill with distinguished ability and acceptance.

WESTMEATH, an inland county of the province of Leinster, Ireland, bounded on the N. by the counties of Cavan and Meath, on the E. by Meath, on the S. by the King's County, and on the W. by Roscommon. It lies between N. lat. 53° 8'

and 53° 48'; and W. long. 6° 54' and 7° 55'. Its greatest length, N. and S., is 35 miles, and the greatest breadth is 25 miles; the total area being 708 miles, or 453,468 acres, of which 365,218 are arable, 56,392 uncultivated, 8803 in plantations, 628 in towns, and 22,427 under water. The population in 1851 was 111,109; in 1861, 90,879, of whom 83,749 were Catholics, 6334 Protestants of the Established Church, and the rest Protestants of other denominations. The surface is for the most part level, the hilly district, which is in the north of the county, not reaching at any point a higher elevation than 710 feet. Nevertheless, owing to the number of lakes, and the large extent of wood in some districts, the scenery is in many places highly picturesque. Geologically, W. belongs to the great central limestone series; yellow sandstone only occurring in two very limited districts. Of the numerous lakes which diversify the surface, one chain belongs to the basin of the Shannon, which river, with its lakes, forms the western boundary, and separates W. from Roscommon; the other, towards the east, flows into the basin of the Boyne. The Shannon is navigable for steamboats throughout that portion of its course which bounds this county; and the inland navigation is further provided for by the Royal Canal, which traverses W. from east to west, and by a branch of the Grand Canal. The county is also traversed by the Midland and Great Western Railway. The climate is mild and less moist than that of the more western midland counties. The soil is a deep heavy loam, producing herbage especially suited to the fattening of cattle, which are here largely fed; sheep also are fed, but not in the same proportion: as are also horses and pigs. There is comparatively little tillage, and almost the only cereal crop is oats. The total acreage under crops of all kinds in 1862 was 120,337, of which only 914 were in wheat, 45,432 acres were in oats, 14,625 in potatoes, 393 in turnips, 46,856 in meadow and clover. The quantity under other green crops than turnips and potatoes was small, and only 68 acres were in flax. On the other hand, the total number of cattle was 78,826, of sheep 137,216, of horses 14,001, and of pigs 16,720. The net annual value of property under the Valuation Act is £319,901. W. is divided into twelve baronies. The chief towns are the assize town and capital, Mullingar (q. v.), Moate, and Athlone, which is partly in the county of Roscommon. It returns three members to the imperial parliament, two for the county and one for the borough of Athlone. The constituency in 1863 numbered 3602. W. anciently formed a portion of the kingdom of Meath (q. v.), but in the 34th of Henry VIII., it was erected into a separate county, and at first included Longford (q. v.) and part of the King's County (q. v.). Many antiquities of the Anglo-Norman period, and some of the Celtic, chiefly tumuli and raths, are found in this interesting and picturesque county.

WESTMINSTER, THE CITY AND LIBERTY OF, now forms part of the English metropolis. It is bounded by Temple Bar on the east, the Thames on the south, Chelsea and Kensington on the west, and Marylebone on the north. The early history of W. is that of the abbey, still the most interesting of its public buildings. In early times, that part of W. which adjoins the Thames was surrounded by a branch of the river, so as to form an island called Thorney Island, from its being covered with brushwood. Here, on the site of the present abbey, Sebert, king of the East Saxons, is said, in the 7th c., to have built a church. It is supposed to have been replaced by an abbey called Westminster, to distinguish it from the cathedral church of St

Paul's, called originally Eastminster. The first edifice of stone erected on the site was built by Edward the Confessor between 1055 and 1065. The Pyx House, a low apartment, 110 feet long by 30 feet wide, vaulted and divided by a central range of eight plain pillars with simple capitals, is nearly all that remains of it. The principal parts of the existing abbey were built by Henry III. In 1220 he erected a chapel dedicated to the Virgin, and a quarter of a century later he took down the old abbey of the Confessor, and erected the existing choir and transepts, and the chapel of Edward the Confessor. The remainder of the building was completed under the abbots, the western parts of the nave and aisles having been erected between 1340 and 1483. The west front and its great window were the work of Richard III. and Henry VII. The latter pulled down the chapel to the Virgin, erected by Henry III. at the east end of the church, and built the chapel known as Henry VII.'s chapel. This completed the interior of the abbey as it now stands; the only important addition made since then having been the upper parts of the two western towers, which were the work of Sir Christopher Wren. The whole building forms a cross. Its extreme length, including Henry VII.'s chapel, is 511 feet; its width across the transepts is 203 feet. The width of the nave and aisles is 79 feet; of the choir, 38 feet; and of Henry VII.'s chapel, 70 feet. The height of the roof is 102 feet, a loftiness unusual in English churches. The eastern front, which is the finest, is still obstructed by St Margaret's Church, and the western is almost entirely hid. It is the interior of the abbey, however, which has at all times excited the most enthusiastic admiration. The harmony of its proportions, and the 'dim religious light' of the lofty and long-drawn aisles, leave on the mind impressions of grandeur and solemnity which churches of greater size fail to produce. The abbey was at one time the burying-place of the English kings, and it has become a national honour to be interred within its walls. It is crowded with tombs and monuments. The chapel of Edward the Confessor, at the east end of the choir, contains his shrine erected by Henry III, the altar-tombs of Edward I., Henry III., Henry V., and Edward III. The canopy of that last mentioned deserves especial notice. It is considered to be one of the greatest works in wood extant, and equal to anything in the best age of medieval art. Against the altar-screen in this part of the church stand the two coronation chairs. One, the king's chair, encloses the stone brought by Edward I. from Soone, on which the Scotch kings were crowned. The other, the consort's chair, was constructed for the coronation of Mary, wife of William III. Both are still used at coronations. Most of the English kings, from the time of Henry VII. down to that of George III., were buried in Henry VII.'s chapel, and there accordingly are the tombs of Queen Elizabeth and Mary Queen of Scots. The most remarkable monuments in other parts of the church are those in the east aisle of the southern transept, known as 'Poets' Corner,' where many of the most eminent British poets have been buried. There monuments are erected to Chaucer, Beaumont, Drayton, Cowley, Dryden, Milton, Gray, Prior, Shakspeare, Thomson, Gay, Goldsmith, Addison, and Ben Jonson. In the north transept are the monuments of Pitt, Fox, Chatham, Canning, and Wilberforce. Elsewhere are the monuments of the great engineers and inventors, Telford, Watt, and Stephenson.

South of the abbey are the Pyx House already mentioned, the chapter-house, the cloisters, the building occupied by W. School, formerly the

monks' dormitory, &c. W. School was founded by Queen Elizabeth for the education of 40 boys known as Queen's scholars, who are prepared for the universities. Other persons send their sons to it, and it has long been one of the leading English public schools.

The city of W. sprang up round the abbey, and the English kings, in consequence of the jealousy with which they regarded the privileges claimed by the citizens of London, early took up their abode there. William Rufus, in 1097, erected a palace between the abbey and the Thames. Its chief apartment was a banqueting hall, with two rows of pillars down the middle. This hall becoming ruinous in the time of Richard II., he pulled it down, and erected in 1397—1399, on the same site, and indeed on the same foundations, the great hall which still exists. It is 90 feet high, and 290 feet long, by 68 feet wide internally, and is roofed by 13 great ribs of timber, combined with a mechanical skill which has not been excelled in any work of the present age. The roof of Westminster Hall is the finest specimen of the purely English art of forming a Gothic roof of wood: with the exception, perhaps, of the Hall of Justice at Padua, it is the largest roof in Europe unsupported by pillars. The law courts were established at the hall in 1224, and they continue to be held in buildings which rest on the northern side of the building, and open into it by side-doors. These law-courts, as an excrescence and out of place, are to be removed to the new buildings about to be erected near Lincoln's Inn Fields.

The old Houses of Parliament which adjoined the hall, and like it lay between the abbey and the Thames, were burnt to the ground in 1834. It was then determined to erect a new building on the same site, but on a much grander scale. The designs of Sir Charles Barry for 'the New Palace of Westminster' were selected as the best, and the work was begun in 1840. The building, now completed, or nearly so, is the most magnificent erected in this country for many centuries. It may be roughly said to form a parallelogram, 900 feet long by 300 feet in width. The principal rooms are the House of Lords and the House of Commons, which occupy the centre of the building, and run on the line of its greatest length. They are separated by an 'Octagon Hall,' with a diameter of 70 feet between the walls. From this hall, one corridor runs north to the House of Commons, and another south to the House of Lords, beyond which are the royal apartments at the extreme south of the building. The entrance to the 'Octagon Hall' is by a passage known as St Stephen's Hall, which communicates by flights of steps with an entrance in the east front, and also with Westminster Hall, which, included in the new building, forms its northern vestibule. The state entrance of the queen is at the south-western extremity, and is, of course, in direct communication with the royal apartments. The building is surmounted by lofty spires and towers. In the centre, above the Octagon Hall, rises the central tower, 300 feet high. At each corner there are towers; at the south-west the Victoria Tower, 346 feet high; at the north-west the clock-tower, surmounted by a belfry spire 320 feet high. The clock has four faces, each 30 feet in diameter; and it strikes the hours on a bell weighing 9 tons, and known as Big Ben. The appearance of the eastern front is still marred by the buildings occupied as law courts, which will, however, be removed on the completion of the new Palace of Justice, near Lincoln's Inn; and then it is believed that the picturesque outline of the palace, seen from the north-east, will for the first time prove all the merit of the architect's designs. Professional critics have

stated many objections to the building, the soundest of which, perhaps, is that it stands too low. The chief subject of regret in connection with it is, that the stone of which it was built, a magnesian limestone from Yorkshire, has begun rapidly to decay, and that it will, in consequence, be impossible to protect the rich ornaments of the exterior from the influence of the atmosphere. The internal decorations, frescoes, and statues are deservedly admired. The House of Peers, 97 feet long, 45 feet wide, and 45 feet high, is rich with carved work gilt, and stained glass. The throne stands at the southern end. On the northern wall, on compartments, are six frescoes, representing (1) the Baptism of Ethelbert (by Dyce); (2) Edward III. conferring the order of the Garter on the Black Prince (by Cope); (3) Henry, Prince of Wales, committed to prison for assaulting Judge Gascoigne (by Cope); (4) the Spirit of Religion (by Horsley); (5) the Spirit of Chivalry (by Maclise); (6) the Spirit of Justice (by Maclise). There are other frescoes and many statues in different parts of the building, all worthy of notice, which we cannot afford to enumerate.—See *Dedication of Westminster Abbey*, by Dean Stanley; *The Memorials of Westminster*, by Rev. Mackenzie E. C. Walcott (1851).

WESTMORELAND, a county in the north-west of England, bounded on the E. by Yorkshire, on the S. and W. by Lancashire, and on the N. by Cumberland and Durham. Area, 485,432 acres, of which 213,876 acres are under crop—22,130 acres being corn crops, 11,191 green crops, 18,159 clover and other grasses, 159,931 permanent pasture (exclusive of hill); number of cattle, 55,328; of sheep, 224,664. Pop. (1861) 60,817. The surface is almost wholly mountainous, the chief summit being Helvellyn (3055 feet), partly on the western border, partly in Cumberland. The other more important summits are Loughrigg Fell, Bowfell, Crossfell, and High Street and Langdale Pikes. Lakes remarkable for their beauty occur. The chief are Windermere (q. v.), partly belonging to Lancashire; and Ullswater (q. v.), between W. and Cumberland. Moorlands are numerous and extensive; but along the courses of the Kent in the south, and the Eden in the north—the principal streams—there are tracts of fertile land. The climate is mild and moist, often with much snow in winter, the deep wreaths of which frequently prove fatal to travellers on the mountain tracks. The soil is mostly a dry gravelly mould, favourable to the culture of turnips, of which great crops are produced. Rich pasture-lands abound, and cattle, mostly of a large size, are extensively reared. The county town is Appleby, and the other chief towns are Ambleside, Kendal, and Kirkby-Lonsdale. The county returns two members to the House of Commons.

WESTPHALIA, a province of Prussia, lies between Holland, Hanover, Brunswick, Hesse, Nassau, and the Rhine Province. Its area is 7758 English sq. m., with a population (December 1864) of 1,666,581, who, with the exception of 16,857 Jews, are of the purest German descent. Of the population, 900,273 are Catholics, and 733,584 Protestants. W. is divided into three districts—Münster in the north-west, Minden in the north-east, and Arnberg in the south. The east of the province presents vast plains covered with grain, while the north-west exhibits an uninterruptedly flat expanse of uncultivated land. The climate is generally temperate. The chief rivers are the Weser (q. v.), the Ems, the Lippe, and the Roß or Ruhr, none of which are navigable in Westphalia. The products are, besides grain, excellent flax, potatoes, wood, iron, copper, lead, salt, &c.; and the chief

of the industrial products are iron, and articles of iron, steel, and copper from the forges of Arnberg; while manufacturing industry embraces flax-spinning and linen-weaving in Minden, and extensive production of woollen articles, stockings, and ribbons of esteemed quality. The exports consist of these products, and of butcher meat, especially hams. The capital of the province, Münster (q. v.), possesses a university, and is the seat of the supreme Catholic and Protestant religious authorities of the province.—W. derives its name from the West-falen, a section of the great Saxon people, who migrated hither from the banks of the Elbe soon after the Christian era; and after the subjugation of the Saxons by Charlemagne, the deposed leader, Wittekind, was allowed to remain *Duke of the Engern and West-falen*. At this time, the country called W. (and occasionally denominated *Sauerland*) comprised all Germany between the Weser, Rhine, and Ems; and soon after, it was subjugated by the dukes of Lower Saxony, and held by them till, on the rebellion of Henry the Lion in 1179, the electoral archbishop of Cologne extended his sway over it. It then became one of the circles of the empire, and belonged to the Cologne electorate till 1802, when most of it was given to the Hesse-Darmstadt family. In 1807 arose the *kingdom of Westphalia*, which, besides a portion of W., also included Electoral Hesse, Hanover, Brunswick, and portions of Upper Saxony. This kingdom, erected by Napoleon as a preliminary to its incorporation into France, was given to his youngest brother, Jerome, who made Cassel his capital, and, despite the large French garrisons with which the country was burdened, and the extensive contributions in men and money which it was forced to pay to Napoleon, succeeded, by the establishment of the Code Napoleon, and by shewing in various other ways his strong desire to promote the welfare of his new subjects, in acquiring their esteem. But the oppressive conscriptions and taxes for the behoof of the French army and treasury gradually increased in amount, and excited such resentment, that Jerome's life was several times threatened. The king repeatedly remonstrated with Napoleon, but without the slightest effect; and despite his efforts, the 'continental system' was introduced into his states. In 1813, Jerome was chased from Cassel by the Russians; and though he returned for a few days, the defeat of Leipzig forced him to take shelter in France. By the treaty of Vienna, the states which had been joined to W. to form the kingdom, were restored to their former possessors, and W. itself, with the exception of a portion which had been annexed to Hesse-Darmstadt, was united to Prussia.

WESTPHALIA, TREATY OF, also known as the *Treaty of Münster*, was concluded at Münster and Osnabruck (towns in the circle of Westphalia) in 1648, and in putting an end to the Thirty Years' War (q. v.), restored tranquillity to Germany, established a new system of political equilibrium in Europe, and became the basis of all subsequent treaties down till the French Revolution. The minor states of Germany had long desired a cessation of hostilities; and as early as 1638, plenipotentiaries from France, Sweden, and the Empire had assembled at Hamburg; but it was not till several years after, that all parties agreed to Münster and Osnabruck as the places, and to March 26, 1642, as the time, of meeting of the congresses. Ferdinand, however, was very loath to commit himself to a definite negotiation till the success of his arms, the hope of succour from Spain, or a change in the French policy, should give him less the position of a beaten opponent willing to accept almost any terms; and he accordingly temporised

from time to time till his hopes of succour had vanished. In 1644, the congresses opened; the two places of meeting having been chosen to avoid any rivalry between France and Sweden for supremacy, to prevent any collision between the Swedish representatives and the pope, and to separate the Catholics from the Protestants. The representatives of France, the Empire, Spain, and the Catholics of Germany, met at Münster under the mediation of the pope, and those of Sweden, the Empire, and the Protestants of Germany under the mediation of the king of Denmark; the representatives of Spain, Portugal, the United Provinces, Savoy, Tuscany, Lorraine, Mantua, and Switzerland being also present; so that this congress included all the great European powers except Britain, and almost all the minor powers. As the conflict was still carried on with undiminished vigour, the inclination of fortune to one side was the signal for excessive demands, which were met on the other side by evasive proposals; and it was not till Torstensohn's decisive campaign of 1644—1645 that negotiations commenced in earnest, and the representatives made specific propositions. The successes of Turenne and Wrangel in Southern Germany, and the capture of Prague by the Swedes under Königsmark in July 1648, at length overcame all the emperor's dilatoriness, and, the Osnabruck representatives having arrived at Münster a few days before, the treaty was finally signed at Münster, 24th October 1648. Its terms, as regards the Germanic Empire, were as follows: The sovereignty and independence of the different states of the empire were fully recognized, and liberty was given them to contract any alliances with each other, or with foreign powers, if these were not against the emperor or the empire; all religious persecution in Germany was forbidden; the treaty of Passau and the religious peace of 1555 were confirmed; and with respect to the secularisation of ecclesiastical benefices, everything was to remain in Austria as it was in 1624 (hence called the *normal year*), and in the Palatinate, Baden, and Würtemberg as it was in 1618; the power of putting under the ban of the empire was only to be exercised with consent of the diet; and the Reformed were put on a footing of equality as to privileges with the Lutherans. The territorial changes were as follows: the Lower Palatinate was restored to the eldest son of the unfortunate 'Winter King' (Frederick V., Elector Palatine), and an eighth electorate was created in his favour, but the Upper Palatinate and Cham were given to Bavaria, on condition that, should the two states become united, one electorate was to be abolished (as happened in 1777, see *BAVARIA*); part of Alsace was ceded to France; Upper Pomerania, Rugen with Stettin, Gartz, Damme, Golnau, the isle of Wollin, Peine, Schweine, and Divenau in Lower Pomerania, Wismar, the secularised archbishopric of Bremen as a duchy, and the bishopric of Verdun as a principality, were obtained by Sweden as fiefs of the empire, with three deliberative voices in the diet, and an indemnification of 5,000,000 crowns to be paid by the empire; Brandenburg obtained, as compensation for its cessions in Pomerania, the secularised archbishopric of Magdeburg as a duchy, and the bishoprics of Halberstadt, Minden, and Camin; Hanover and Mecklenburg were compensated for their share in these cessions by secularised church lands; and Hesse-Cassel obtained the rich abbacy of Hirschfeld, with 600,000 thalers. The independence of the United Provinces was recognized by Spain, and that of Switzerland by the Empire. The pope's agent, Fabio Chigi (afterwards Pope Alexander VII.), protested vigorously against the liberal alienation of

the possessions of the Church, and withdrew; and the king of Denmark's mediation being stopped by his war with Sweden in 1644, the treaty was concluded under the sole mediation of the Republic of Venice, and France and Sweden became guarantees for its execution. France, Sweden, and the Protestants were the only gainers by this treaty, which, by weakening the great central authority of the empire, destroyed its unity, allowed France, as one of the guarantees, a pretext for continual interference with its internal affairs, and gave the *coup de grace* to the independence of the remaining free cities of the empire.

WEST POINT, site of the United States Military Academy, and of a fortress erected during the War of Independence, on the right bank of the Hudson River, 52 miles north of New York. The Military Academy is on a plain, 160 to 180 feet above the river, surrounded by the bold scenery of one of the finest river-passes in the world. The forts and a river chain were taken by the British in 1777, but abandoned after Burgoyne's surrender, and stronger forts were built, which General Arnold bargained to betray—a plot foiled by the arrest of Major André. The academy was established in 1802, for 40 cadet artilleryists and 10 engineers. The number was increased, in 1808, to 156; in 1812, to 250. It is governed by a board of five visitors and a staff of 41 professors and teachers. The education is free—each pupil engaging to serve eight years. Each member of congress has the right to nominate one cadet from his district, and ten are appointed by the president. The course of study and discipline is four years: (1) mathematics, engineering, fencing, bayonet-exercise, school of the soldier; (2) mathematics, French, fencing, tactics of infantry, artillery, and cavalry; (3) natural philosophy, chemistry, drawing, riding, tactics; (4) military and civil engineering, mineralogy, geology, chemistry, law, literature, practical military engineering, tactics.

WESTPORT, a small seaport town of Connaught, Ireland, county Mayo, stands in a pretty valley at the mouth of a small stream that falls into Clew Bay, about 35 miles north-north-west of Galway. Formerly W. was supported principally by linen manufactures; but it is now known mostly for its trade in corn and provisions, and for its facilities for sea-bathing. In the immediate vicinity is the Reek, a mountain 2510 feet high, from which magnificent views of the coast and neighbourhood may be obtained. In 1865, 171 vessels of 18,978 tons entered and cleared the port. Pop. (1861) 3819.

WEST PRUSSIA. See *PRUSSIA*, PROVINCE OF.

WETSTEIN, the name of a Swiss family illustrious for the talents and learning of its members, originally from Kyburg, in the canton of Zürich. Among the more noteworthy are—(1.) **JOH. JAKOB W.**, born at Basel in 1594, who was first in the service of the Venetian state. In 1620, he became a member of the Supreme Council of his native town; represented Switzerland at the Peace of Westphalia (1648); was raised to the rank of a noble in 1653, and died in 1666.—(2.) **JOH. RUD. W.**, son of the preceding, was born at Basel in 1614, and died there in 1683, professor of theology. He was a great opponent of the introduction of the *Formula Consensus*, and assisted Suicer in drawing up his *Thesaurus Ecclesiasticus*.—(3.) **JOH. RUD. W.**, son of the preceding, born at Basel in 1647, and died there in 1711; also professor of theology, favourably known as an early editor of Origen.—But the most distinguished member of the family is **JOH. JAK.**

W., son of Joh. Rud. W., the younger, who was born at Basel, 5th March 1693. After a thorough study of the classics, Hebrew, philosophy, and mathematics, he was made a Ph.D. at the age of 16. Four years later, he became a minister, and gave himself up to the study of the New Testament. In 1717, he began to give lessons in theology at the university of Basel, and continued to do so until 1730, when (being suspected of Socinianism) he was forced to leave Switzerland. He sought an asylum in Holland, where the Remonstrants appointed him professor of theology at Amsterdam in 1733. He died there 23d March 1754. W.'s great work is his edition of the New Testament, with prolegomena, a collection of various readings, and Latin notes (2 vols., Amst. 1751—1752). Its publication marks an epoch in the history of New Testament criticism. Semler reprinted the prolegomena with additions (Halle, 1764).

WETTE, DE. See DE WETTE.

WETTER, LAKE, after Lake Wener (q. v.), the largest lake in Sweden, lies in Gotland, about 25 miles south-east of Lake Wener in direct line. It is 70 miles long, 13 miles in average breadth, has an area of 850 sq. m., is 370 feet in greatest depth, and is 300 feet above the level of the Baltic. It receives about 90 small tributaries, though its waters have only one outlet, the Motala River, which, flowing eastward, maintains the communication of the lake with the Baltic. Its waters are clear, and of a beautiful green colour, and it is surrounded by lofty romantic shores, almost unbroken by bays. It is remarkable for an irregular alternation of risings and fallings, and for an occasional undulation, which is so rapid and violent as to break the thick sheet of ice with which it is covered in winter. An intricate chain of small lakes, continued westward by the Göta Canal, connects Lake W. with Lake Wener, and thus with the Cattegat. Lake W. contains few islands, and of these the chief is Wisingsö, $1\frac{1}{2}$ miles long by $\frac{1}{4}$ mile broad.

WETTERHORN (Peak of Tempests), a lofty mountain of the Bernese Oberland, Switzerland, on the east side of the Grindelwald, and about 10 miles south-east of the Lake of Brienz. From the path by which it is ascended, it rises in one vast precipice of alpine limestone, seeming to threaten the traveller. Height variously stated at 12,200 feet and 14,105 feet.

WETZLAR, a small town of Rhenish Prussia, charmingly situated on the Lahn, 40 miles north of Frankfurt-on-the-Maine. Part of its old cathedral is said to date from the 11th century. W. is notable as the scene of the *Sorrows of Werther*. Pop. 5500.

WEXFORD, a maritime county of the province of Leinster, Ireland, is bounded on the N. by the county of Wicklow, on the E. by the English Channel, on the S. by the Atlantic, and on the W. by the counties of Waterford, Kilkenny, and Carlow. Its greatest length north and south is 55 miles, and its greatest breadth east and west is 34 miles. The total area comprises 900 sq. m., or 576,616 acres, of which 510,702 are arable, 45,501 uncultivated, 14,325 in plantations, 2392 in towns, and 3668 under water. The pop. in 1861 was 143,815, of whom 130,103 were Roman Catholics, 12,759 Protestants of the Established Church, and the rest Protestants of other denominations. The coast-line of W., which extends from Kilmichael Point to the estuary of the Suir, Waterford Harbour, is irregular, and very dangerous for shipping. From the above-named Point to Wexford Harbour there is no opening for navigation; and as Wexford Harbour, besides being intricate and dangerous, is also

obstructed by a bar, it offers little security in boisterous weather. The coast from the southern headland of Wexford Harbour, Rosslare Point, to the mouth of the Suir, presents a succession of bays and headlands. The headland called Carnore Point is the south-eastern extremity of Ireland. Parallel with the northern coast-line, at a distance of a few miles, is a range of sandbanks; and the southern shores are beset by outlying rocks and islets, which, although somewhat guarded by light-houses and light-ships, frequently prove fatal to shipping. The greater part of the surface is tolerably level, but some detached hills rise to considerable elevation. The mountains of the border are much more elevated, the highest point of the Blackstairs being 2409 feet; and of Mount Leinster, 2610. There are few lakes, and these of small size. The principal river is the Slaney, which for some distance is the boundary between W. and Carlow, but enters W. near Newtownbarry, whence it flows by Enniscorthy into the sea in Wexford Harbour. In its geological structure, W. belongs to the eastern clay-slate tract, which stretches in a south-westerly direction from the north of Wicklow to the Atlantic, and which extends across the level districts as far as the granite range separating W. from Carlow. Granite is found in the south-east of the county, and in some of the detached hills, as are also beds of greenstone. Silver was formerly raised near a place called Clonmines, where traces of an ancient mine are still seen, and galena has been found in the same place. Copper ore is found at a place called Kerlogue, near W., and plumbago and asbestos have been discovered near Enniscorthy; but none of these minerals has been raised with profit. The climate is said to be singularly temperate, and the district, as being sheltered by its mountain border, is considered more suitable, in point of temperature, for agriculture than the adjacent counties of Carlow and Kilkenny, although inferior in fertility of soil. The total acreage under crops, in 1862, was 235,826: of which 21,881 was under wheat; 65,899 oats; 39,816 barley; 5911 beans; 24,284 potatoes; 18,370 turnips; 2107 mangold wurzel; 55,404 meadow and clover, and the rest minor crops; only 68 acres being under flax. The annual value of property in W., under the Valuation Act, is £371,972. There are but few and inconsiderable manufactures, and the trade is chiefly in the export of agricultural produce, especially barley; butter, cattle, pigs, poultry, and eggs are also exported in large quantities. W. is divided into nine baronies. The principal towns are Wexford (q. v.), Enniscorthy, New Ross, and Gorey; Newtownbarry and Taghmon also deserve to be noticed, as each having a population of about 1000; and Duncannon, although now very inconsiderable in size, for the sake of its ancient fort and interesting historical associations. The maritime position of W. laid it open early to the incursions of the Danes, to whom the name Wexford, or Weisford, is traced by antiquaries. It was the first landing-place of the English in the invasion, and formed part of the tract granted by MacMurrough to the English adventurers whose assistance he had invoked. By the marriage of Strongbow with Eva, MacMurrough's daughter, it came into his hands; and after the partition of his lands among his daughters at his death, W. underwent many changes of masters. During the civil wars which followed 1641, W. was the scene of frequent contests; and in the more recent insurrection of 1798, it formed the theatre of the only formidable conflicts of the peasantry with the regular troops. There are numerous relics of antiquity, Celtic as well as Anglo-Norman, in almost every part of the county. Upwards of a hundred castles are still traceable, and many ecclesiastical

WEXFORD—WHALE.

remains, of which the monasteries of Dumbrody, Tintern, Ross, and some others are not unworthy of the best days of mediæval architecture. W. returns four members to the imperial parliament, two for the county at large, one for the borough of Wexford, and one for that of New Ross.

WEXFORD, capital of the county of that name, a seaport, and parliamentary and municipal burgh, is situated at the mouth of the river Slaney, 74 miles south from Dublin, with which it communicates by the Wicklow, Wexford, and Waterford Railway, complete as far as Ennis-corthy. The pop. in 1861 was 12,015, of whom 11,573 were Roman Catholics, 649 Protestants of the Established Church, and the rest Protestants of other denominations. The town is situated on the south-western shore of the estuary of the Slaney, which is known as Wexford Harbour, and along which the quay extends nearly 1000 yards, forming a spacious and not inelegant terrace. Behind this, the town extends in two nearly parallel streets. There are two Protestant, and three Catholic churches. Of the latter, two are modern and handsome structures. One of the former, St Selsker's, is ancient, part of its walls dating from the English invasion. There are also a Presbyterian, a Methodist, and a Quaker meeting-house; a convent of Franciscan Friars, a nunnery, a Roman Catholic college, and National, Christian Brothers', and conventual schools. Besides the union workhouse, there are also an infirmary and a fever hospital. The only manufactures of any importance pursued are those of distillation and the grinding of corn; the chief industry of the town being in connection with the export trade of the county, already described. The position of W. for export trade, favourable in itself, is much marred by the shallowness and intricate character of the channel of the Slaney, which has the further disadvantage of being obstructed by a bar. Great efforts have been made for its improvement, a patent slip and dock have been constructed, and an active shipping-trade is carried on. The W. fisheries also have long been reckoned among the most valuable on the eastern coast. The town is extremely ancient, and was occupied by the Danes as one of their strongest settlements. From the time of the invasion, it became an English stronghold against the native population. During the civil wars of 1641, it was occupied by the confederated Catholics, but was taken by Cromwell in 1644. The insurgents of 1798 also had possession of it for a short time. W. returns one member to the imperial parliament. Its municipal affairs are managed by a corporation, with a revenue from borough rates of £1260.

WEYMOUTH, a township of Massachusetts, U. S., on Boston Harbour, twelve miles south-south-east of Boston, on South Shore Railway, containing the fishing and coasting village of Weymouth Landing, and the manufacturing villages of East Weymouth and South Weymouth, with large factories of nails, boots and shoes, &c. Pop. in 1860, 7742.

WEYMOUTH-AND-MELCOMBE-REGIS, a seaport, a fashionable watering-place, and a municipal and parliamentary borough of Dorsetshire, on a bend of the coast facing the south-east, and at the mouth of the river Wey, three miles north of the isle of Portland, and eight miles south of Dorchester by railway, seven in a straight line. A projecting point, called the Nothe, separates the two quarters—the old town of Weymouth lying to the south of it, the modern town, Melcombe-Regis, extending to the north, and facing the sea. The two quarters communicate by means of a bridge with a swing in the middle, to permit the passage of ships. The old town is uninteresting in appear-

ance; Melcombe-Regis, elegantly built, stands on a narrow peninsula, with the sea on the east, and an estuary on the west side. Its chief features are the sea-terrace and esplanade, the latter adorned with a statue of George III., who largely patronised Melcombe. The harbour has fourteen feet of water at full tide, and in the bay there is good anchorage in seven or eight fathoms. Portland Harbour, now in process of completion, will be a source of great trade to the town. W. and M. is the seat of steam-traffic to the Channel Islands. Ship-building, rope and sail making, and the export of Portland stone and Roman cement, employ the great mass of the inhabitants. The town is connected with the Great Western and London and South-western Railways, and there is one in course of construction to connect it with Portland Isle. Pop. (1861) 11,383.

WHALE, the popular name of the larger cetaceans, particularly of all those belonging to the families *Balenidæ* and *Physeteridæ* or *Catodontidæ*. The latter family has already been noticed in the article CACHOLOP, and some of the species of *Delphinidæ*, also sometimes called whales, have been described in separate articles, as the CAALING WHALE and the BELUGA. The *Balenidæ* alone remain to be described now. In this family, the head is of enormous size, as in the *Catodontidæ*, but is

Jaws of Greenland Whale, shewing the Baleen.

entirely destitute of teeth, instead of which, the palate is furnished with an apparatus of *baleen*, or *whalebone*, for the purpose of straining out of the water the small crustaceans and scalephæ, which form the food of these whales. Rudiments of teeth,

Food of the Whale, consisting of minute shrimps, sea-snails, medusa, &c.

however—dental pulps—appear in the foetus of the whale—sixty or seventy on each side of each jaw; but they are re-absorbed into the system, and the plates of whalebone are not produced from them, but from the integuments.

The fibrous structure of baleen, or *whalebone*, its elasticity, and its heaviness, are well known. The

WHALE

plates of it in the mouth of a W. are very numerous, several hundreds on each side of the mouth, and they are very closely placed together, so that the mouth is filled with them; the whole quantity in the mouth of a large W. sometimes amounting to nearly two tons in weight. They are suspended from the roof of the mouth; none proceed from the lower jaw. They extend on each side from the middle line of the palate, like the barbs of a feather; those in the middle of the mouth are longest. The base of each plate is embedded in the substance of the membrane that covers the palate, whilst its edge forms a loose fringe, composed of fibres or pliant bristles. The vast mouth being opened, water is taken in; and the small animals which enter with it being retained for food, the water is allowed to escape by the sides of the mouth.

The tongue is a soft thick mass, not extending beyond the back of the mouth. The gullet of whales is very narrow; it is said not to be more than an inch and a half in diameter even in a large W., so that only very small animals can pass through it.—The head of whales occupies from a third to a fourth of the whole length. The skull is unsymmetrical, the right side being larger than the left. The flesh is red, firm, and coarse. The skin is naked, with the exception of a few bristles about the jaws, and its surface is moistened by an oily fluid. The lower surface of the true skin extends into a thick layer of *blubber*, an open network of fibres in which fat is held. The blubber is from a foot to two feet in thickness, the whole mass in a large W. sometimes weighing more than thirty tons, and serves the purpose of keeping the animal warm, as well as of making the specific gravity of the whole body much lighter than it would otherwise be, and of resisting the pressure of the water in the great depths to which it often descends.

The skin of whales is always infested with parasites; molluscs adhere to it; certain kinds of cirrhopods burrow and live in it; and crustaceans, such as the Whale-louse (q. v.) attach themselves to it, and feed upon it.

It has been attempted to calculate the age of whales from the transverse lines on the plates of baleen, and in this way it has been computed that they attain the age of 800 or 900 years, each transverse line being assumed to indicate an annual check of growth; but it is evident that there is no good ground for the assumption on which such calculation proceeds.

In the genus *Balæna* there is no dorsal fin, nor elevation of the back corresponding to it, as in some of the family. The belly is smooth, not plaited, as in the other genera of the family. The most important species, and indeed the most important of all the whales, is that known as the RIGHT W., or GREENLAND W. (*B. mysticetus*). It inhabits the seas of the northern parts of the world, and abounds chiefly in the arctic regions. It is sometimes seen on the coasts of Britain, and even in more southern latitudes. It attains a size of sixty or seventy feet in length. The body is thickest a little behind the *flippers*, or pectoral fins, tapering conically towards the tail, and slightly towards the head. The tail is five or six feet long, and from twenty to twenty-five feet broad; formed of two diverging lobes, broadest almost where they are united, but with a slight indentation. The pectoral fins are eight or nine feet long, and four or five feet broad. The mouth is fifteen or sixteen feet long. The eyes, which are situated on the sides of the head, about a foot above and rather behind the angles of the mouth, are not larger than those of an ox; but the sense of sight seems to be acute, at least in the water. The iris is white. The blow-holes are situated on the most

elevated part of the head; they are from eight to twelve inches long, but of comparatively small breadth. The upper parts are velvety black, the lower parts white. The upper parts, in very old whales, sometimes become piebald, the black being mixed with white and gray. The period of gestation is uncertain; one young one is produced at a birth, and is from ten to fourteen feet in length when born. The mother displays great affection for her offspring, of which whale-fishers sometimes take undue advantage, harpooning the young one—itsself of little value—in order to secure the mother. Suckling is performed at the surface of the water, and the mother rolls from side to side, that she and the young one may be able to breathe in turn. The usual rate of progress in swimming is about four or five miles an hour, and whales often swim not far beneath the surface of the water, with the mouth wide open to take in water from which to sift food.

Greenland or Right Whale (*Balæna mysticetus*).

The W. is capable, however, of swimming with much greater rapidity, and when harpooned, it often descends to a great depth in a few seconds. Its tail is extremely powerful, and a single blow of it is sufficient to destroy a large boat, or toss it and its crew into the air, so that the whale-fishery is attended with no little danger. Whales usually come to the surface to breathe at intervals of eight or ten minutes, but they are capable of remaining under water for half an hour or more. When they come up to breathe, they generally remain on the surface about two minutes, during which they blow eight or nine times, and then descend. The noise which they make in blowing is very loud, and the spout of water ejected ascends several yards into the air, appearing at a distance like a puff of smoke. They often assume, as if in sport, a vertical position, with the head down, and flap the surface of the water with the tail, making a sound which is heard two or three miles off. The Greenland W. is not properly gregarious, being generally found alone or in pairs, except when numbers are attracted to particular feeding-grounds, as is sometimes the case in the bays and inlets of northern coasts.

It was formerly supposed that the Greenland W. was an inhabitant of the southern as well as of the northern parts of the world; but the SOUTHERN or CAPE W. (*B. australis*) is now regarded as a distinct species, the head being smaller in proportion than that of its northern congener, and the colour a uniform black. It attains the length of 50 or 60 feet. It is usually found in comparatively shallow water near coasts. It occurs not only in the colder parts of the southern hemisphere, but throughout

its temperate regions, and its range extends into the tropics. It has been taken even as far north as Japan. Its capture is prosecuted to a considerable extent, particularly on the coasts of South Africa and New Zealand, although this whale-fishery is not nearly so important as that of the northern seas. Several other species of *Balæna* have been described, but they are imperfectly ascertained and characterised, specimens not often coming under the observation of competent naturalists in a perfect state. The *Nordkaper* of the Icelanders has by some naturalists been described as a distinct species, although it is more generally regarded as a variety of *B. mysticetus*. It differs, however, from the common variety in having the body more slender and the head proportionally smaller; the under jaw very round, deep and broad; and the plates of baleen comparatively short. It is of a gray colour; the lower part of the head of a brilliant white. It is said to be more active and more fierce than the Common W., so that its capture is attended with greater danger.

The species of the genus *Megaptera* are called HUMP-BACKED WHALES, and by whale-fishers ordinarily *Hump-backs*. They have a rudimentary dorsal fin, in the form of an elevation of the back. There are several species, but some of them are very imperfectly known. *M. longimana*, so called from the length of the pectoral fins, is found in the North Sea, and is included in the British fauna. *M. Americana*, the BERMU^DA HUMP-BACKED W., occurs chiefly about the Bermudas, from which its baleen is extensively imported. Another species, *M. Pæskop*, occurs at the Cape of Good Hope.

The genus *Balænoptera*, *Physalus*, or *Rorqualus* is distinguished by having a dorsal fin. See RORQUAL.

All the species of these genera are objects of pursuit to whale-fishers, although the Greenland W. is that which they prefer.

Important as the W. is to civilised man, both for the oil and the whalebone which it yields, it is still more important to the rude natives of arctic regions, as the Esquimaux and Greenlanders, who use its oil for food as well as for burning, and to whom its flesh also is a chief article of food; while its bones and baleen are used for making tents, sledges, boats, harpoons, and spears; the sinews supply a substitute for twine or thread; and the membranes are used instead of glass for windows. There is no essential difference in the way in which the capture of whales is prosecuted by the rudest tribes and the most civilised nations. The whale-fishers approach the whale in boats, and attack it by harpoons to which lines are affixed, following up and repeating the attack, until its strength is exhausted, taking advantage of the necessity which it experiences of coming at intervals to the surface to breathe, and finally killing it with lances, which are thrust into the most vital parts.

In its most simple form, the harpoon is an iron spear about 5 feet in length, with a much flattened point, having sharp cutting edges, and two large

Harpoon.

flattened barbs. Many modifications have been made, the most important perhaps being the gun-harpoon. The ordinary harpoons are attached to a long line at the opposite end to the barbed point, and when the boat is near enough to the W., the man whose duty it is darts or plunges the

weapon with all his force into the animal's side. In its fleeing from the attack, the line is rapidly drawn out of the boat, until the creature is tired, and rises to the surface for air. The boat follows, keeping as much of the line as possible, until, exhausted by pain and loss of blood, the animal succumbs. It will be seen that much depends upon the sharpness of the blade-like edges of the barbs, and their power to hold when in; hence many ingenious devices of movable barbs have been contrived, which close on the shaft of the instrument in going into the animal's flesh, but open outwards as soon as there is any strain on the shaft. The gun-harpoon is a short bar of iron with the barbed spear at the end, and a ring with chain for the attachment of the line; this is fired from a small swivel cannon attached to the whaler's boat. However well the harpoon may be fixed in the animal's body, its death and capture are still very difficult matters to accomplish, and take much time. To obviate this, a very ingenious expedient was suggested by Dr Christison, the eminent toxicologist of Edinburgh University, that glass tubes containing prussic acid should be so placed in the shaft of the harpoon, that the moment the cord or line was pulled tight, they would be broken in the animal's body, and occasion instant death. This plan has been tried with great success, but has met with opposition from the whale-fishers, who have a prejudice against using a poison which they see has such deadly effects. Another mode of employing prussic acid is to enclose a glass tube containing it, in a hollow rifle bullet about four inches long, which is fired from a rifle made for the purpose, the bullet containing also an explosive substance connected with a fuse, which is kindled as the rifle is fired, so that the bullet bursts immediately after penetrating the whale, and spreads its deadly contents through the flesh. The bullet is made of zinc, because it breaks into fragments more angular than any other metal. The success of this method has been found to be perfect, but sailors object to its use, dreading to touch the carcass of a whale which has been killed by so powerful a poison, for a whale struck by a bullet charged with prussic acid only disappears for about five minutes, and rises to the surface dead. Strychnia has been used instead of prussic acid, and with similar results.

The lance used for killing the W. has generally a blade 5 or 6 inches long, and 2½ or 3 inches broad, with sharp cutting edges, and a long wooden handle.

The ships fitted out from European and American ports for the northern whale-fishery are generally from 300 to 400 tons burden. To protect them from injury by ice, they are fortified with an additional series of planks, iron plates, and a *false* or *ice stem*, on the sides of which are *ice-knees*—angular blocks of wood filling up the concavity formed by the stem and fore-planks. The stern is also defended by *ice-plates* of half-inch iron; and many timbers and stanchions are added in the interior of the vessel, great strength being a more important requisite than fast sailing. Each ship has generally 6 or 7 boats, *carver-built*, from 23 to 28 feet in length, each capable of carrying 6 or 7 men, with 7 or 8 cwt. of whale-lines, &c. The crew of a whaler consists of 40 or 50 men, each of whom, from the master to the boys, generally receives, in addition to his fixed wage, a gratuity for every W. caught, and a certain sum for every tun of oil produced by the cargo. Each boat carries 2 harpoons and 6 or 8 lances. When the ship arrives in the vicinity of a whaling-ground, a look-out is stationed at the mast-head. As soon as a W. is discovered, the boats are lowered, and a competition ensues among their

WHALE.

crews, all exerting their utmost strength to reach the W. first. The harpooner is ready, as soon as the boat is sufficiently near the W., to hurl his harpoon with all his force; the crew instantly back the boat, and the W. generally plunges in terror to a great depth, sometimes carrying out more than 200 fathoms of line. It remains below for 20 minutes or more, and when it rises, the boats hasten to it again; it is struck with a second harpoon, and probably, instead of at once descending, it strikes violently with its tail, to destroy its enemies, when great caution is requisite. It cannot now remain long below the surface, and when it comes up, probably spouts blood through the blowholes. When it is lanced, it sometimes dies almost at once, but sometimes there is a terrific struggle—the water is lashed into foam, and dyed with blood. It not unfrequently happens, that instead of dying at the surface of the water, the W. descends, and does not rise again, so that it is lost to the whaler. The carcass of the W. is towed by the boats to the ship, and made fast to the ship's chains. The process of *scensing* is then commenced. Some of the crew, having their boots armed with iron spikes, to prevent them from slipping, descend upon the carcass, and cut into the blubber with *blubber-spades*, removing a broad strip or *blanket* of skin, 20 or 30 feet long, which is hoisted to the deck by means of a hook and tackle. Great cubical pieces of blubber, of half a ton or a ton in weight, are then cut out, and hoisted on deck. In this way, the process is carried on, the W. being turned over and over, that every part may be reached; till, in three or four hours, the whole mass of blubber is removed from it—probably amounting to 20 or 30 tons. Meanwhile, others of the crew have descended into the mouth of the W., and removed the baleen. The remainder of the carcass is then flung adrift, and sometimes sinks, but often swims, in consequence of incipient putrefaction, to afford food for bears and fishes. The blubber, after being received on deck, is cut into smaller cubical pieces, and subjected at leisure to a process by which the cellular tissue is separated from it. This is called *making-off* or *trying-out*; and to accomplish it, the blubber is heated in a large pot, and afterwards strained, the scraps or cracknels from one pot serving as fuel for another, and the ship being made filthy with smoke, soot, and grease. The product is finally stored in caaks, to be conveyed home, and boiled for oil. A ton of blubber yields nearly 200 gallons of oil. A single W. often yields blubber and whalebone to the value of £700 or £800. The whalebone is subjected to no process but that of drying till it is brought home.

Ships often return from the whale-fishery *clean*—i. e., without having captured a single whale. The greatest number of whales known to have ever been captured by a single vessel in a season is 44; yielding 299 tons of oil, of 252 gallons each. This was in 1814; the fortunate whaler belonged to Peterhead, in Scotland, and the oil alone, according to the price of that year, £32 per tun, was worth £9568. When the price of oil and whalebone has been higher, even greater profits have been realised by whalers making fewer captures.

It is usual for whalers to resort to the arctic whale-fishery in spring, and to return in autumn; but Captain Penny adopted with great success, in 1853—1854, the method of wintering in the arctic regions.

The Norwegians sent vessels to Greenland for the whale-fishery in the 9th century. They had previously prosecuted it on their own coasts, and the Norman settlers on the Bay of Biscay carried it on there, whales inhabiting that bay in considerable numbers, till, through the eager prosecution of the

fishery, they became so few that about the 15th c. it became unprofitable, and was relinquished. In 1261, a tithe was laid upon the tongues of whales brought into Bayonne, they being then highly esteemed for food. The French, Spaniards, and Flemings early began to fit out vessels for the northern whale-fishery; the English entered upon it with great spirit in the end of the 16th c., and about the same time the Dutch, Danes, and Hamburgers. The British Muscovy Company obtained a royal charter, giving them a monopoly of the whale-fishery of the coasts of Spitzbergen, on the pretence of its having been discovered by Sir Hugh Willoughby, although, in fact, it was discovered by the Dutch navigator Barentz. Other nations were not disposed to acknowledge the claims of the English; the Dutch in particular sent out a strong fleet, between which and the ships of the Muscovy Company an engagement took place in 1618, and the English were defeated. The Spitzbergen bays and seas were afterwards divided into fishing-stations, allocated to the whalers of the rival nations. No nation now asserts a claim to the exclusive right of whale-fishing in any quarter. The Spitzbergen fishery was thrown open to all nations in 1642.

The English for some time prosecuted the whale-fishery sluggishly and with incompetent means; the Dutch carried it on with great vigour and success. During the latter half of the 17th c., the Dutch furnished almost all Europe with oil. In 1680, they had 260 ships and about 14,000 men employed in the whale-fishery; but from that time the Dutch fishery began to decline. In 1732, Great Britain attempted to encourage the whale-fishery by a bounty of 30s. a ton to every ship of 200 tons engaged in it, which was raised in 1749 to 40s., reduced to 30s. in 1777, and again raised to 40s. in 1781. The object of the bounty was not only to encourage the trade, but to make it a nursery for seamen. Ships, however, were fitted out rather for the bounty than for the capture of whales, and during the next five years after the reduction of the bounty in 1777, the number of ships employed in the trade was reduced from 105 to 39. After 1781, it rapidly increased, and continued to increase although the bounty was reduced. The bounty was finally altogether withdrawn in 1824; yet in 1815, when the British whale-fishery was in its most flourishing condition, only 164 ships were engaged in it. The Dutch whale-fishery had in the meantime almost entirely ceased, owing to the national calamities consequent on the French Revolution. The British whale-fishery is still prosecuted, although not nearly to the extent that it was fifty years ago. The French whale-fishery has in like manner declined. The Americans are at present more actively engaged in the whale-fishery than any other nation. The New England colonies entered upon this enterprise at a very early period, at first merely by boats on their own coasts, which, however, were deserted by whales before the middle of the 18th c., and ships then began to be fitted out for the northern seas. For a number of years, however, the American whale-fishery also has been declining, owing to the scarcity of whales, and because substitutes for whale-oil and whalebone have been found.

Of all British towns, Peterhead is that which of late has shewn the greatest enterprise in the whale-fishery, and next to it are Hull and Dundee. In America, New Bedford demands special notice. It is at present the greatest whaling-port in the world. Nantucket also sends out many whalers.

The ships engaged in the whale-fishery generally add to their cargoes of oil by the capture of seals.

WHALES, in point of law, belong to the crown, according to the law of England, if they are caught

or found within the territorial sea—that is, within the limit of three miles from the shore; or in the inner seas, as distinguished from the open sea. This is contrary to the general rule—that he who first captures a wild animal is entitled to the property thereof. Whales are thus called royal fish; and it is said sturgeons and porpoises also fall under the same class. If the whales are not caught in the territorial seas, which are part of the realm, but in the open sea, then the law of nature applies, or rather a secondary law or custom governs the right of property, and that law, though varying slightly according to locality, is, that the person who first captures the whale is entitled to keep it. In the Greenland seas, the local custom is that the first harpooner who strikes the whale is entitled to the property only if he continue to hold the whale by the line attached to his harpoon; but if his line break, and a subsequent harpooner from another ship finish the capture by obtaining possession, then the latter is entitled, for it is a loose fish. This rule, however, has been qualified in this way, that the first harpooner who strikes the fish and keeps it entangled is entitled, even though a volunteer come up and officiously strike the fish, thereby causing it to struggle and break from the first line. At Gallipagos, South America, the custom is that he who first strikes the whale with a drong, or loose harpoon, is entitled to receive half of it. The same rules govern the right of property in whales when similar questions arise between parties litigating in Scotland. The law of Scotland, as well as England, adopts whatever local custom prevails where the whale was captured.

WHALEBONE. The baleen plates which take the place of teeth in the mouths of the Baleen Whales (see **WHALE**), constitute the whalebone of commerce. They vary in length from a few inches up to ten, and even in rare instances to twelve feet. Their chemical constitution is albumen hardened by a small proportion of phosphate of lime. Their colour is usually of a bluish black, but in some species they are striped longitudinally with bands of a whitish colour; and they terminate at the point in a number of coarse black fibres of the baleen, which fibres are also found more or less down both sides of the blade. These fibres are much used by brushmakers. There are three principal kinds in the market, and they are generally known as *whale-fins*. The first is the *Greenland*, or *Davis' Strait and North Sea fins*; second, the *South Sea*, or *black fish-fins*; third, the *North-west coast*, or *American whale fins*. Whalebone requires some preparation before being fit for use; this, however, is very simple. It is first trimmed—that is, all the hairs are removed from the point and edges of each blade; and generally the surface of each flat side is scraped. The blades are then boiled in water for several hours, until they become soft enough to be cut easily with a common knife. The workman then cuts them into lengths fitted for the purposes to which they are to be applied. They are chiefly used in thin strips, such as stay-bones and umbrella-ribs, and can be easily split for such purposes, owing to their lamellar structure. Generally, the boiling is combined with a dyeing process, to make the whalebone perfectly black, which is preferred to the not agreeable natural colour. The quantity annually imported into Britain rarely exceeds 150 tons; but as the price ranges from £450 to £500 per ton, that represents a large value.—Strips of rattan canes dyed black are used as a cheap kind of artificial whalebone, but the best imitation is made of vulcanite or prepared caoutchouc, which in many respects is superior to the real whalebone.

WHALE-LOUSE (*Cyamus*), a genus of Crustacea, of the order *Lemnodipoda*, having the body short and rather broad; the legs short and stout; seven pair of legs; the first pair more slender than the rest; the first, second, fifth, sixth, and seventh pair furnished with sharp hooked claws, the third and fourth not terminating in claws, but in a long almost cylindrical joint. All the species are parasitic on Cetacea, attaching themselves to the skin by means of their claws.

Whale-louse.

Whales are sometimes so completely covered with them, as to appear of a whitish colour even at a distance; and when the whale is captured, its skin is found to be deprived of the epidermis. *Cyamus Ceti* is said also to infest the mackerel and other fishes of the family *Scomberidae*.

WHANG-HAI, or **YELLOW SEA**, an important inlet of the Pacific Ocean, washes the north part of the east coast of China, and is bounded on the W. by the Chinese provinces of Shang-tung and Keang-su, and on the E. by the peninsula of the Corea and Japan. It terminates on the north-west in the Gulfs of Pe-chih-li and Leao-tong, and opens out in the south-east into the Tung-hai, or Eastern Sea. It is more than 600 miles long, and over 400 miles in average breadth. The W. is shallow, and near the land its waters are of a lemon colour, owing to the nature of the bottom, which is often furrowed by vessels navigating it. By degrees, it is becoming more and more shallow, owing to the quantity of alluvium borne down into it by the rivers Hwang-ho (q. v.) and Yang-tze (q. v.).

WHARNCLIFFE MEETING. By a standing order of the House of Lords, which was proposed by Lord Wharnccliffe, and is still known by the title of the 'Wharnccliffe Order,' no bill to empower any company already constituted by act of parliament to execute, undertake, or contribute towards any work other than that for which such company was originally established, or to sell, lease, or abandon its undertaking, or any part thereof, or to amalgamate with any other undertaking, or to dissolve, is allowed to proceed in the House of Lords until it is reported that such bill has been submitted to a special meeting of the proprietors of the company, convened by public advertisement, and by circular addressed to each proprietor; that such meeting was held not earlier than seven days after the last insertion of such advertisement; and that at such meeting the bill was submitted to the proprietors present, and approved of by proprietors present, in person or by proxy, holding at least three-fourths of the paid-up capital of the company represented at such meeting. Of late years, a number of bills are in each session originated in the House of Lords; and since the introduction of this practice, the meetings held in conformity with this order are popularly known as 'Wharnccliffe Meetings.' The House of Commons has adopted a corresponding standing order applicable to such bills coming from the Lords.

WHARTON, PHILIP WHARTON, DUKE OF, was the son of Thomas, Marquis of Wharton, an eminent member of the Whig party in Queen Anne's reign, and Lord-lieutenant of Ireland from 1708 until after the fall of the Godolphin administration in 1710. Macaulay says he was licentious and corrupt; but the faults of his Irish administration

were largely redeemed by his appointment of Addison as Chief-secretary. George I. made him Lord Privy Seal and Marquis of W. in 1715, but he died three months afterwards. His son, Philip, born 1698, was educated at home by his father, who aimed at making him a great orator, a Whig in politics, and a Presbyterian in religion. In a boyish freak, he contracted a clandestine marriage at the Fleet with the daughter of Major-general Holmes. The shock is said to have killed both his parents. W. soon parted from his wife, and in 1716 went abroad with a French Huguenot tutor, to be brought up according to his father's dying instructions, in strict Presbyterian principles, at Geneva. He contracted debts, spurned the restraints of his tutor, and ran away to Lyon. He visited the Pretender at Avignon, and, it is said, accepted from him the title of Duke of Northumberland. He next visited Paris, and after various extravagances, set out for Ireland, where, although he had not yet reached his 19th year, he was allowed to take his seat in the House of Peers. He soon displayed such splendid abilities in debate, and supported the government with so much zeal, that although still under age, he was, January 20, 1718, raised to the highest rank in the English peerage. He did not take his seat in the English House of Peers until 1720. Here he opposed with much warmth the government measure on the South Sea Bill, and the bill of pains and penalties against Bishop Atterbury. His affairs became hopelessly involved by his extravagance, so that although he had succeeded to an estate of £16,000 a year, he was soon compelled to accept a yearly allowance of £1200 from his creditors. He set up a political paper, called the *True Briton*, in 1723; and lost no occasion of speaking, as well as writing, against the ministry and the court. In 1724, he set out for Vienna, and then visited Madrid, where he was served with an order from the Privy Seal to return home. He treated the order with contempt, and afterwards went to Rome, and appeared openly at the court of the Pretender, from whom he accepted the Order of the Garter. He now assumed the title of Duke of Northumberland. In 1727, he fought with the Spaniards and against his countrymen at the siege of Gibraltar. This last mad act lost him his English title and estates, and led to his conviction under a bill of indictment for high treason. He refused to make his submission to the government; and the rest of his life was passed in France and Spain, at one moment squandering his precarious supplies of money in drunkenness and luxury, and at another suffering the extreme poverty. He died in a miserable condition at a Bernardine convent in Catalonia, May 31, 1731. His brilliant talents and wasted life were sketched by Pope in his *Moral Essays*, in the lines beginning—

Wharton, the scorn and wonder of our days.

The Life and Writings of Philip, late Duke of Wharton, were published in 1732 (Lond. 2 vols. 8vo); and another two-volume publication, entitled *The Poetical Works of Philip, late Duke of Wharton, and of the Duke's Intimate Acquaintance*, appears, with the exception of the title-page and a prefixed biography of W., to have been printed in 1727. This publication, however, contains little that is even attributed to the duke.

WHATELY, RICHARD, Archbishop of Dublin, was born in Cavendish Square, London, 1st February 1787, and was the fourth son of Dr Joseph Whately of Nonsuch Park, Surrey, Prebendary of Bristol, Vicar of Widford, and lecturer at Gresham College. He was sent in due time to a private school at Bristol, from which, in 1805, he passed to Oriol

College, Oxford. He took his Bachelor's degree in 1808, taking a second class both in classics and in mathematics. He got the English-essay prize in 1810. In the following year, he was elected a Fellow of Oriol College, which at that time ranked among its Fellows not a few men destined to play a considerable part in the world, and already remarkable for their attainments and intellectual activity—a. g., Arnold, Keble, Pusey, and the elder Newman. In 1815, he became one of the tutors of his college; and about this time he wrote (originally for the *Encyclopædia Metropolitana*) what he afterwards expanded into his popular treatises on *Logic* and *Rhetoric*. In 1821, he married a daughter of W. Pope, Esq., of Hillingdon, Middlesex. In the same year, he published two works; the one a volume of sermons on *The Christian's Duty with respect to the Established Government and the Laics*; the other a work which is among the most celebrated and characteristic of his writings: this was *Historic Doubts relative to Napoleon Bonaparte*. Its object was to throw ridicule upon the criticism to which the Gospel narratives were subjected by sceptical writers, by applying the same kind of criticism to events within the memory of all the world, and starting doubts as to whether these events had occurred. This *jeu d'esprit* with a purpose created a great sensation. It has been translated into several foreign languages. In 1822, W. was presented to the living of Halesworth, in Suffolk. In the same year, he delivered the Bampton Lectures at Oxford, taking for his subject the 'Use and Abuse of Party Feeling in Religion.' In 1825, he was appointed by Lord Grenville Principal of St Alban's Hall, which, under his energetic rule, quickly lost the bad character it had long sustained in the university. In 1829, he was appointed Professor of Political Economy; but he was destined not to hold this office long enough to do more than deliver an introductory course of lectures. In 1831, Lord Grey's government, at the instance of Lord Brougham, appointed him Archbishop of Dublin and Bishop of Glendallach. Afterwards, in 1846, his episcopal charge was enlarged by the addition of the bishopric of Kildare.

During the ten years preceding his appointment to the archbishopric, W. had incessantly been writing and publishing, chiefly upon theological and ecclesiastical subjects. He belonged to the Liberal school in religion and in politics; he was opposed, that is, to High Church or Catholic views in theology, and to Toryism in politics. He had taken a keen interest in the political questions of the time, and especially had made himself conspicuous in the university by his advocacy of Catholic emancipation, of which the party in the church which had most sympathy with the theology and ecclesiastical system of the Roman Church were the most determined opponents. When Sir R. Peel, after his change of views on the emancipation question, voluntarily submitted himself for reelection to the university, W., though a Liberal, came forward to support him, and was one of the most active of those who endeavoured to prevent his rejection. His *Essays on some of the Peculiarities of the Christian Religion* appeared in 1825; his *Elements of Logic*, in 1826; the *Elements of Rhetoric*, in 1828; his *Essays on some of the Difficulties in the Writings of St Paul, &c.*, also in 1828; his *Thoughts on the Sabbath*, in 1830; and in the same year, the *Errors of Romanism traced to their Origin in Human Nature*. His *Introductory Lectures on Political Economy* were published in 1831. By this time, his writings, and the great activity and ability which he displayed in his various public functions, had placed him among the foremost

men of the university, and had also got him rank among the most remarkable thinkers and writers of his time. Though many distrusted him as a Liberal, questioned the soundness of some parts of his theology, or thought his manners too eccentric, and his habit of mind too peculiar, for one who was to rule over others, nobody questioned that his abilities and reputation were equal to the high position bestowed upon him by Lord Grey.

As Archbishop of Dublin, W. was very active in all matters of importance, social and ecclesiastical, and shewed a deep interest in every question affecting the welfare of Ireland. He was one of the original members of the Board of National Education, and continued a member till 1853, when he retired, in consequence of a departure, as he thought, having been made from the principles on which, up to that time, the national education had been carried on. He was perhaps the most active member of the Board, and the success of the national system was in a great measure owing to him. He and members of his family were always foremost in supporting well-devised charitable schemes. His liberality was, in fact, unbounded, though an opposite impression prevailed among those who did not know him, because he wrote and spoke strongly against casual benevolence, and used to say he had never given a penny to a beggar. As archbishop, his rule was firm and judicious. A slight disregard of etiquette was about the worst thing ever alleged against him: he was not disposed to make much difference between a rector and his curate. His activity as an author was not stifled by his energetic discharge of his public duties; indeed, he seems to have been always either writing a book, or affording literary help to others. Besides many charges, sermons, and a few pamphlets, his *Kingdom of Christ Delineated*, one of the most remarkable of his works; his *Introductory Lectures to the Study of St Paul's Epistles*; his *English Synonyms*; and his annotated edition of Bacon's *Essays*—perhaps the best example of good editing in the English language—belong to this period of his life. A work, published anonymously in 1855, *Scripture Revelations respecting Good and Bad Angels*, has been generally ascribed to Whately.

He died on the 8th October 1863. The world's esteem and the regard of his friends for him had been growing to the last. In early life, there was much about him to shock the fastidious, and some things which might hurt the sensitive; but his peculiarities softened and wore off as he advanced in years. At Oxford, he was noted for his rough unceremonious manners, for which (together with his dress) he was nicknamed the White Bear; and for the plain speaking and rough ridicule with which he would overwhelm an opponent in an argument. He was remarkable, too, for his fondness for athletic sports, which he indulged with a perfect indifference to the minor proprieties. He used to say that his abrupt and careless and seemingly unfeeling ways were a recoil from the painful shyness for which he had been remarkable in his youth. Those who knew him, however, made light of his peculiarities; and few things about him are more pleasing than his firm belief in the merits of his friends, and the number, the warmth, and the permanence of his friendships. He had great talents for conversation, and was famous for his bon-mots, happy repartees, and conversational pleasantries of every kind. His writings are not so much remarkable for subtlety of thought or novelty of view as for strong logic, acuteness, felicity of arrangement and exposition, and the frequency and homely force of his illustrations. He had the happy power of building up materials which might be old into a new,

commodious, and almost a beautiful structure. He did nothing for mere ornament's sake: though his imagination was abundantly fertile, it was used only to illuminate his argument; his images are seldom impressive for their beauty, though admirably fitted for didactic purposes. His theological works have been charged with a 'cold rationalistic' tendency, and with being wanting in reverence; and it has been inferred, though perhaps too hastily, from some passages in his writings, that he was heretical on the subject of the Trinity. The *Historic Doubts*, the *Essays on the Peculiarities of the Christian Religion*, the *Errors of Romanism*, and the *Kingdom of Christ*, are perhaps the most valuable and characteristic of his writings.—The *Life and Correspondence of R. Whately, D.D., &c.*, by his daughter, E. Jane Whately, was published at London in 1866. It is an interesting, though in some respects a partial, and in some degree an inadequate, memorial of Dr Whately. As might be expected, the 'White Bear' side of his character is kept in the shade: but few examples are given of the coarse but racy conversational wit which was one of the Archbishop's claims to distinction among his contemporaries. And it is scarcely possible to gather from it what his exact position was in theology or in literature, though the letters, which form a great part of it, give a very fine impression of the qualities which distinguish his works.

WHEAT, the most valuable and, next to maize, the most productive of all the cereal grasses. The genus *Triticum*, of which the species are popularly known either as *Wheat* or *Wheat-grass*, is distinguished by a spike with many-flowered spikelets, without stalks, and seated one on each notch of the rachis, their sides directed to the rachis, which is zigzag; and two glumes, of which the lower is either awned or awnless; the outer palea of each floret having at the top a notch, in the centre of which is the terminal point, sometimes prolonged into an awn, or, in some species, with many florets tapering into an awn without a notch. A number of species are found in Britain, of which *T. repens*, well known as Couch Grass (q.v.), is the most common; but the seeds of none of them are of any value. The native country of the cultivated W. has generally been supposed to be the central part of Asia; but a discovery was made not many years ago by M. Fabre of Agde, in the south of France, that the *Ægilops ovata*, a grass of the regions near the Mediterranean, and of the west of Asia, becomes transformed by cultivation into wheat. The announcement of this discovery was at first received with much doubt, although the possibility of the transformation had been suggested by previous botanists; but it has been confirmed by subsequent observations and experiments. The genus *Ægilops*, as hitherto recognised by botanists, is distinguished from *Triticum* chiefly by its more numerous awns, the glumes of *Æ. ovata* being generally terminated by 3 or 4 awns, prolongations of their ribs, and the palea by 2 or 3 short awns. The awns of grasses, however, afford very uncertain characters, being extremely liable to disappear through change of circumstances; and among the cultivated varieties of W., every farmer is familiar with some that are awned or bearded, and some that are beardless, having scarcely a trace of awn. In the wild *Ægilops*, the ear is also much more easily broken from the rachis than in wheat. In cultivation, the *Æ. ovata* very soon loses the awns of its palea and of the lateral ribs of its glumes, and thus assumes the characters of W., the ears at the same time losing their fragility, the grain also increasing in size, whilst the floral envelopes are proportionally diminished, the leaves become larger, and the stem

WHEAT.

stronger. From seeds of the *A. ovata* sown in a garden in 1838, M. Fabre obtained W. of fair quality in 1846. Professor Buckman, of the Royal Agricultural College, repeated the experiment in England. His first sowing was in 1855, and notwithstanding the disadvantages of cold seasons and a cold situation on the Coteswold Hills, he found the spikelets much modified in 1859, the warm summer of that year producing a greater change than had taken place in previous years (see *Popular Science Review* for October 1861). The annexed cut shows the natural state of a spikelet of *A. ovata* (fig. 1); the spikelet as modified by cultivation from 1855 to 1859 (fig. 2); and for comparison, an ear of ordinary bearded W. (fig. 3). The identity of the principal cultivated forms of *Triticum* with *A. ovata* may now be regarded as fully established. These forms have generally been included by botanists under the name *T. vulgare*.

W. has been cultivated from the earliest ages, and was a chief crop in ancient Egypt and Palestine, as it still is in all the temperate parts of Europe, Asia, and Africa. It is cultivated to a considerable extent in the north of India. In North America, it is very extensively cultivated, and many parts of the United States and British provinces are admirably adapted to it. Wide regions of South America are equally suitable, and W. of the finest quality is produced in Australia. In the torrid zone, W. does not succeed, except in elevated situations; but it nowhere succeeds better than in subtropical regions, although it is a hardy plant, and when covered by snow, endures even very severe winters in the north of Europe. For its successful cultivation, however, it requires a mean temperature of at least 55° F. for three or four months of the year. It is an annual plant, and its capacity of enduring the cold of winter is of importance only in connection with the advantage to be derived from sowing in autumn, so as to have it more forward in spring. Its cultivation does not extend so far north as that of barley or oats, or even of rye. In Europe, its northern limit is about lat. 60°. The quality of the grain varies much in different soils and climates, and particular varieties are also distinguished by difference of quality as well as by external characters. The W. of the eastern parts of Britain, where the climate is comparatively dry, is superior to that of the western parts, where the sky is more cloudy and the climate more humid, although the crops in the west are not less luxuriant; and the W. produced in Britain is not found suitable for the manufacture of macaroni, to which that of the countries near the Mediterranean is particularly adapted. Although hardy in winter and early spring, W. becomes more delicate and susceptible of climatic influences as it advances in growth; a prevalence of dry weather, with bright sunshine from the time when it comes into ear until it is ripe, is of the greatest importance.

COMMON W. (*T. vulgare, aestivum, or sativum*) grows to a height generally of 3 or 4 feet, and has ears or spikes generally 3 or 4 inches long; the spike 4-cornered, the spikelets about 4-flowered; the palea ventricose, ovate, truncate, mucronate or awned, compressed under the point, rounded at the back, the grain free. In consequence of long cultivation, in a great variety of climates, the cultivated varieties of W. are very numerous, more so than in

4, Chiddam Wheat; 5, Pearl Wheat; 6, Spalding's Prolific Red Wheat.

any other kind of grain. New varieties are continually coming into notice; and many are in high estimation in particular districts, although little known beyond them. Some botanists have attempted to distinguish species among them, appropriating the name *T. aestivum* to the awnless kinds, and *T. hybernum* to the awned; but intermediate forms are very numerous, and the length or shortness of the awn seems to depend upon accidental circumstances. Nor do the awnless or beardless kinds perfectly correspond with the Summer W. of farmers, preferred for sowing in spring with a view to a crop in the same season, and the awned or bearded kinds to the Winter W., sown in autumn, as some of the hardy varieties of Winter W. are awnless, and some of those usually sown in spring are bearded. Besides being classified as Bearded and Beardless, the varieties in cultivation are also distinguished according to the colour of the grain, as *White* and *Red* wheats. Some having the ears covered with a short soft down are known as *Woolly* wheats. There are also differences in the length and compactness of the spike, and in the size and form of the grain, which is more rounded in some, and more elongated in others. A number of varieties, having the spike very compact or square, have been sometimes classed together under the name of *T. compactum*, and the distinction is very obvious and permanent, although there is no reason for regarding it as characterising a distinct species. Akin to this

WHEAT.

is the MUMMY W. (*T. compositum*), in which the spike is branched, and which is said, but on insufficient evidence, to have been produced from seeds found in mummy-cases in Egypt. Mummy W. has been grown in England, of which the ears have had 10 or 11 branches, and 150 grains have been found in one ear; whilst 60 ears have been produced by a single seed. Notwithstanding these apparent advantages, however, this variety does not serve the purposes of the farmer so well as some others. In

7, Fern Wheat; 8, Mummy Wheat.

another group of varieties with compact ears (*T. turgidum* of some botanists), the glumes are remarkably tumid, and always awned. These are known by the names of Gray W., Pollard W., Duckbill W., &c., and in Germany are commonly called English Wheat. Polonian W. (*T. Polonicum*) is the common name of a number of kinds of a very peculiar appearance, with a long, loose, and somewhat nodding spike; the glumes awned, and remarkably long—twice the length of the florets. The stems are also very tall, sometimes more than 6 feet high. These kinds, sometimes called *Grecian* or *MOGADORE* W., are cultivated in some parts of the south of Europe, in the south of Siberia, and in Africa. **HARD** W., or **HORNY** W. (*T. durum*), has rather small, elongated, and very hard grains, the pales have remarkably long awns, and the leaves are very broad. It is much cultivated in the countries near the Mediterranean, and Dr Royle suggests that it would be a valuable acquisition to India, as it yields a good crop on comparatively sterile soils.

The red varieties of W. are generally more hardy than the white; the grain is inferior in quality, and yields less flour, but these disadvantages are more than counterbalanced in many soils and situations by the greater productiveness of the crop. Red wheats are therefore preferred for comparatively poor soils, but the white kinds are generally cultivated wherever the soil and climate are suitable. The varieties with long straw yield the best crops in dry seasons, but the short-strawed kinds are best when the season is wet. W. is particularly suited to clay soils, and rich heavy loams; but with good farming, excellent crops are produced even on light sandy or gravelly, and on chalky soils. Where the climate is moist, a light dry soil is most suitable; soft deep soils being productive chiefly of straw. The land intended for W. must, at least in Britain, be in a high state of cultivation. W. is commonly sown after green crops, beans, or bare fallow; in the south of England, often after grass or clover. It may be sown, at least in autumn or the beginning of winter, when the ground is so saturated with moisture, that any other kind of grain would be almost sure to perish. It is either sown broadcast or in drills, and the practice of drilling becomes more and more prevalent, both on account of the saving of seed and the superiority of the crops produced. The land prepared for W. is very often manured with farm-yard manure; artificial manures—as guano—are also used. In Scotland, it is a common practice, when W. is to be grown after turnips, to plough down the turnip-leaves in autumn, before the W. is sown, and to apply guano in spring. Nitrate of soda is another favourite top-dressing for W., but sometimes causes the plants to grow too rapidly, so that they become tender, and suffer from climatic influences. Many farmers use both guano and nitrate of soda for top-dressing W., and the nitrate of soda is often mixed with common salt, which is thought to be useful in giving strength and vigour to the W. plants, preventing *lodging* and mildew. W. ought to be reaped before it is *dead ripe*, unless when it is intended for seed, and it ought to be stacked as soon as it is sufficiently dry to be free from danger of heating. On very rich land, W. sometimes becomes too luxuriant in spring, and its growth needs to be repressed by cutting the leaves with a scythe—a practice essentially agreeing with that mentioned by Virgil in his *Georgics* (l. 111), of allowing cattle to feed upon the young blades:

Quid, qui, ne gravidis procumbat culmus aristis,
Luxurium segetum tenera depascit in herba,
Quam primum sulcos sequant sata?

The relative proportions of straw and grain differ very much in different varieties of W., and according to differences of soil, climate, and season. The proportion of the weight of grain to that of the whole plant when dried so as to be ready for stacking, varies from 20 to 47 per cent. The composition of the grain itself varies considerably, as to the proportions of starch, gluten, &c. which it contains. 100 parts of the grain of W., dried in the ordinary manner, contain on an average—water, 14·83; gluten, 19·64; albumen, 0·95; starch, 45·99; gum, 1·52; sugar, 1·50; oil, 0·87; vegetable fibre, 12·34; ash, 2·36; total, 100·00.

The ash is rich in phosphoric acid, magnesia, and potash. Its composition is as follows: Potash, 29·97; soda, 3·90; magnesia, 12·30; lime, 3·40; phosphoric acid, 46·00; sulphuric acid, 0·33; silica, 3·35; peroxide of iron, 0·79; chloride of sodium, 0·09; total, 100·00. For the processes by which starch and gluten are obtained from W., see these articles.

The value of W. depends mainly on the quantity

of fine flour which it yields; the best W. yielding 76—80 per cent., sometimes even 86 per cent. of fine flour, whereas inferior kinds seldom yield more than 68 per cent., and sometimes only 54—56 per cent. In general, the smoother and thinner the grain is in skin, the greater is the produce of fine flour. The greater part of the husk of W. is separated from the flour by the miller, and is known as *bran*. That portion of the bran which is more finely divided than the rest, receives the name of *sharps* or *pollard*. See the articles *BRAN* and *FLOUR*.

W. straw contains, on an average, in its ordinary state of dryness—nitrogenous substances, 1.85; non-nitrogenous substances, 67.56; mineral substances, 4.59; water, 26.00: total, 100.00; and the composition of the ash is as follows: potash, 12.14; soda, 0.60; magnesia, 2.74; lime, 6.23; phosphoric acid, 5.43; sulphuric acid, 3.88; silica, 67.88; peroxide of iron, 0.74; chloride of sodium, 0.22: total, 100.00.

The principal diseases to which W. is subject, some of which are often productive of great loss to the farmer, are either owing to or connected with the presence of parasitic fungi. See *BUNT*, *MILDEW*, *RUST*, and *SMUT*. An animalcule causes the disease known as *EAR-COCKLES* (q. v.). W. suffers also from the ravages of numerous species of insects. See *HESIAN FLY*, *WHEAT-FLY*, *CORN-MOTH*, and *WIREWORM*. The larva of a Ground Beetle (*Zabrus gibbus*) is often very destructive to young W. in winter and spring.

SPELT (*Triticum spelta*) is regarded as a distinct species from Common W., and is supposed to be a cultivated form of *Agilops caudata*, a native of the countries near the Mediterranean. The spikelets are smaller than in Common W., and each spikelet has two or three, rarely four, perfect florets, besides a barren terminal one, the outer glumes and the pales are very broadly truncate at the top, and notched, the awns very slender; the ripened grain adheres closely to the pales or chaff. Spelt is supposed to be the grain called *Zea* by the Greeks and *Far* by the Romans. It is of little value in comparison with W., but can be grown on inferior soils, and is cultivated in Switzerland at an elevation where W. would not succeed. The bread made of it is coarse, and is used chiefly by the poorer classes.—Another species, sometimes called *LESSER SPELT*, or *ONE-GRAINED W.* (*Triticum monococcum*), is also occasionally cultivated on poor soils and in elevated situations in the centre and south of Europe. It is sometimes called *St Peter's Corn*. The ear is small and compressed, the spikelets contain only one perfect floret and a rudimentary one; the awns are long; the grain is small, and adheres closely to the chaff.—*Triticum Bengalense* may be regarded as a kind of spelt. It has remote spikelets, long awns, and long irregularly triangular grains. It is cultivated to some extent in India.

Wheat being the most esteemed of all the cereals, particularly for the making of bread, the increase of its cultivation and use has marked the progress of agriculture and of wealth in many countries, and particularly in Britain. It is only of late that bread made of wheat has become a common article of food among the labouring classes in Britain. In some parts of the country, it is still, indeed, far from being a principal article of food among the peasantry, who use barley and oats in various forms. In the 8th c., the monks of the abbey of St Edmund, in England, ate barley-bread, because the income of the abbey would not admit of their using wheaten bread regularly. At a later period, wheat was largely used, at least in the southern parts of England, for a short time after harvest, but the supply was soon exhausted, and recourse was again had to inferior

kinds of food. There was then no trade in corn to equalise the price over the year. In 1317, when an abundant harvest had been gathered in, the price of wheat fell at once from 80s. to 6s. 8d. per quarter. The rejoicings of harvest-home were, therefore, in these times connected with a transition from poor to good fare, and from comparative want to abundance, such as happily does not attend the same occasion in our day. Down to the end of the 17th c., wheaten bread was a principal article of food only among the more wealthy; and the servants in their houses were still furnished with oats, barley, and rye. In the northern parts of England, as well as in Scotland, the use of wheaten bread was comparatively rare even at the middle of last century. 'So small was the quantity of wheat used in the county of Cumberland,' says Eden, in his *History of the Poor* (1797), 'that it was only a rich family that used a peck of wheat in the course of the year, and that was used at Christmas. The usual treat for a stranger was a thick oat-cake (called *haver-bannock*) and butter. An old labourer of 85 remarks that when he was a boy he was at Carlisle market with his father, and wishing to indulge himself with a penny loaf made of wheat-flour, he searched for it for some time, but could not procure a piece of wheaten bread at any shop in the town.' At the period of the Revolution, 1689, the quantity of wheat grown in England was estimated at about 14,000,000 bushels, or about three bushels to each of the population, which was then under five millions. In 1628, about 100,000,000 bushels were produced, or about seven bushels to each of the population, then under fifteen millions (see *Library of Entertaining Knowledge; Vegetable Substances used for the Food of Man*, Lond. 1832). In 1866, there were 3,275,293 acres under wheat in England and Wales, and 110,101 acres in Scotland, the produce of which may be estimated at almost 100,000,000 bushels; besides which, a very large quantity of wheat has been imported from other countries. The cultivation of wheat now extends to the most northern parts of Scotland, 4718 acres having been under this crop in 1866, in the county of Elgin, and 4684 in Ross and Cromarty, and even in Caithness 26, and in Orkney and Shetland 79. The population of England and Scotland being now about 24,500,000, it appears that the quantity of home-grown wheat consumed amounts to fully 4 bushels for each of the population; but the wheat imported in 1866 amounted to about 42,000,000 bushels; raising the amount consumed to nearly six bushels per head of the population. Ireland is left out of account, as not being to a great extent either a wheat-growing or a wheat-consuming country. The produce per acre is greater in Britain than in any other wheat-growing country, owing to superior farming, notwithstanding disadvantages of climate and often of soil. The extent of land now under wheat has, however, of late years diminished, owing to the foreign supply, and the high price of butcher-meat making pasturage now profitable. The quantity of wheat produced in the United States in 1860 was estimated at about 173,000,000 bushels, of which nearly 24,000,000 bushels were produced by the state of Illinois, nearly 17,000,000 by Indiana, and about almost as much by Wisconsin. The progress of wheat-cultivation in the western states has been extremely rapid. Illinois now produces more wheat than any other state of the union. Chicago has become one of the greatest wheat-exporting ports in the world. The exportation of wheat from Chicago began in 1838, when 78 bushels were exported; and in 1862, the quantity exported amounted to 22,902,755 bushels; this rapid increase being due to the increase of wheat-culture in previously unsettled regions. The greater part

of the wheat exported from North America is to Great Britain. Of the wheat imported into the United Kingdom during the five years 1862—1866, the United States contributed 31 per cent.; Prussia and the other northern parts of Germany, 18·8 per cent.; Russia, 18 per cent.; France, 12 per cent.; British North America, 7 per cent., and Turkey, 2 per cent.

WHEA'TEAR, or **FALLOW-CHAT** (*Saxicola ananthe*), a bird of the genus popularly known by the name Chat (q. v.), of the family *Sylviadae*, a common summer visitant of Britain, abounding on downs and fallow fields. Its geographic range is

Wheatear (*Saxicola ananthe*).

wide. Its winter retreat is in the countries near the Mediterranean, and chiefly in Africa; its summer migrations extend to the furthest north of Europe, and to Iceland and Greenland. A few wheatears spend the winter on the southern coasts of England. The entire length of the W. is about six inches and a half; the tail is almost square; the wings are long and pointed; and the legs are long, enabling the bird to hop about actively in quest of food. Its food consists of worms and insects, and it may often be seen perched on the top of a clod or stone, looking out for them, and at the same time on the watch against enemies. The male is of an ash-brown colour on the upper parts; the forehead, a band above the eyes, and the throat, white; a black mark extending from the base of the bill to each eye, and expanding behind it, so as to cover the orifice of the ear; the wings, black; the rump, and two-thirds of the tail, except the two middle feathers, white; the tip of the tail, black; the two middle feathers of the tail, entirely black; the breast, buff-colour; the belly and flanks, pale buffy white. The female is less gaily coloured, brown and gray prevailing. The W. makes its nest in an old wall, or in a crevice of a quarry or gravel-pit, often in a deserted rabbit-burrow, and generally lays six pale-blue eggs. The male has a pleasant, but not loud song, and sings well in confinement, in winter as well as in summer. This little bird is much esteemed for the table, and great numbers are therefore annually caught, not only on the continent of Europe, but in England, where comparatively few small birds are sought after for such use. It is chiefly on the downs of the south of England, where vast flocks congregate before their autumn migration, that wheatears are caught for the market. The shepherds catch them by means of nooses placed in little excavations made in the ground, advantage being thus taken of the habits of the bird, which upon the least alarm, or even the shadow of a passing cloud, runs to hide itself in any little hollow that may be near. The usual practice of the shepherds is to cut out an

oblong piece of turf, about 11 inches by 8, and 6 inches thick, which they lay across the hole that is made, making sloping entrances at the ends of the hole, and setting nooses under the turf in the centre. As many as 84 dozen wheatears have been thus caught by a single shepherd in a day. It is not unusual for a shepherd and his lad to look after from 500 to 700 of these traps. The season for catching wheatears extends from the end of July to the end of September. They are partly sent to the London market, but very many are consumed at the watering-places on the Sussex coast.

WHEAT-FLY, the popular name of certain species of dipterous insects, which are often very injurious to wheat-crops. One of them, *Cecidomyia tritici* (see *CECIDOMYIA*), sometimes called the **WHEAT MIDGE**, and belonging to the same genus with the destructive Hessian Fly of America, is too common both on the continent of Europe and in Britain, but fortunately is not very abundant except in particular years. It is supposed to be the same fly which appeared in the north of New England in 1828, probably imported from the Old World, and thence spread into New York and Canada, destroying a tenth part of the wheat-crop for several years, and only disappearing on being starved out by a change of crop, or by late spring-sowing of wheat. The eggs are deposited in the wheat when it is coming into flower, and the larvæ abstracting the juices, cause the grain to shrivel. The perfect insect appears in June, when great numbers may sometimes be seen on wing in the evening, their chief time of activity. It is about one-tenth of an inch in length, pale ochreous or orange, downy, with large black eyes, and long slender legs; the male with very long antennæ. The antennæ of the male differ much in structure from those of the female, as will be seen by the annexed fig. (g, h),

Wheat-fly (*Cecidomyia tritici*).

(From Morton's *Cyclopædia of Agriculture*.)

a, larva in spikelet of wheat; b, pupa in the same; c, larva, natural size; d, do. magnified; e, pupa, natural size; f, do. magnified; g, a few joints of one of the antennæ of a male wheat-fly; h, do. of female; i, female wheat-fly, natural size; k, do. magnified.

and are of twenty-five joints, whilst those of the female have only thirteen. The larvæ are small and lemon-coloured. A little black ichneumon lays its eggs in the larva of the W., and is thus useful to the farmer by destroying it.—The name W. is also given to species of the genus *Chlorops* (see **CORN-FLY**) destructive to wheat.

WHEATON, HENRY, American jurist and diplomatist, was born at Providence, Rhode Island,

November 27, 1785, educated at Brown University; admitted to the bar in 1802; after which he spent several years in France, and six months in London, engaged in legal and literary studies. On his return to America, he resided in New York, where he contributed papers on International Law to the *National Advocate*, a daily newspaper, and was appointed a justice of the Marine Court. In 1815, he published a *Digest of the Law of Maritime Captures or Prizes*, which has been commended as one of the best works, in English, on the subject. About the same time, he published an *Essay on the Means of maintaining the Commercial and Naval Interests of the United States*. In 1816, he was appointed Reporter of the Proceedings of the Supreme Court of the United States, a post he filled until 1827. His Reports, filling twelve volumes, a distinguished German has called 'the Golden Book of American Law'; and it is considered by the legal profession as a work of extraordinary ability and value. He also made frequent contributions to the *North American* and *American Quarterly Reviews*, and delivered addresses before literary societies. In 1825, he was engaged in revising the statute laws of New York; in 1826, he wrote his *Life of William Pinckney*, of which he furnished an abridgment for Sparks's *American Biographies*. In 1827, he was appointed *Chargé d'affaires* to Denmark, and resided at Copenhagen till 1835, when he was appointed Resident Minister at Berlin, and in 1837, Minister Plenipotentiary, which post he occupied with distinguished credit until 1846. In 1831, his *History of the Northmen* appeared at Philadelphia, London, and Paris; in 1836, his *Elements of International Law*; in 1841, his *Essay*, for which he received the prize of the French Institute, entitled *L'Histoire du Droit des Gens en Europe, depuis la Paix de Westphalie jusqu'au Congrès de Vienne*, which, in 1846, was published, greatly enlarged, in Leipzig and Paris, and an English translation in New York. This work is a standard authority, and its author received the highest honours from the learned societies of Europe, and his own countrymen. Having retired from political life, he died at his residence at Dorchester, Massachusetts, March 11, 1848.

WHEATSTONE, CHARLES, physicist and electrician, was born at Gloucester in 1802. From school he went to the making of musical instruments, and afterwards entered into business on his own account in London. But he was no ordinary manufacturer: the scientific principles involved in the construction of instruments occupied his thought; he made many improvements, and in 1823, published a paper entitled *New Experiments on Sound*. Endowed with remarkable ingenuity, he produced numerous models and apparatus to illustrate the phenomena of acoustics and of light, his attention having been drawn to the latter by the analogies between the two subjects. Few men have done so much towards enabling the student to apprehend the principles on which scientific theories are based, particularly those of the undulatory theory of light.

In 1833, Mr W. communicated his first paper, *On Acoustic Figures*, to the Royal Society; followed, in 1834, by *Experiments to measure the Velocity of Electricity*, in which, with a mirror revolving 800 times in a second, he demonstrated the velocity at 288,000 miles in a second—greater than that of light. In the same year, he was appointed Professor of Natural Philosophy in King's College, London. In 1836, he was elected a Fellow of the Royal Society; and in a course of lectures at the College on the velocity above referred to, he anticipated the electric telegraph by experimenting through four miles of copper wire. In May

1837, a patent was taken out in the joint names of Cooke and W., 'for improvements in giving signals and sounding alarms in distant places by means of electric currents transmitted through metallic circuits.' From this instrument, which had five needles, has grown that system of electric telegraphs which now ramifies over the length and breadth of the United Kingdom. The first working-telegraph—insulated copper wires enclosed in an iron tube—was constructed on the Blackwall Railway in 1838.

To enumerate the titles only of Professor W.'s papers on scientific subjects, and describe his various inventions, would fill many pages: a few only can be indicated here. In a paper on Bino-cular vision laid before the Royal Society in 1838, he explained the principle of the stereoscope, an instrument of his invention: in 1840, he shewed that, by means of electro-magnetism, a number of clocks far apart might be kept going with absolute exactitude from one central clock; and in 1843, he brought out his new instruments and processes for determining the constants of a voltaic series. In 1840, and again in 1843, the Royal Society awarded him their Royal Medal—a high acknowledgment of the merit of his researches. Since then, scarcely a year has passed without a paper on some recondite scientific subject, or some new invention, or improvement on former inventions, from the hand of Professor W., which have heightened his reputation, and procured him substantial pecuniary reward. He has brought out his cryptograph, his automatic telegraph in two forms; and his telegraph thermometer and barometer, by which an observer at the foot of a mountain could read the indications as shewn by the instruments on the summit. His latest invention is a machine for the conversion of dynamical into electrical force without the use of permanent magnets, by which large quantities of electricity can be produced at a cheap rate, to be used for laboratory and manufacturing purposes.

Professor W.'s scientific writings are contained in the *Annals of Philosophy*; *Journal of the Royal Institution*; *Philosophical Magazine*; *Reports of the British Association*; and *Philosophical Transactions and Proceedings of the Royal Society*. He has sat many times on the Council, and has been a Vice-president of the Royal Society, and is a Corresponding Member of the Imperial Institute of France, and of the leading scientific academies of the principal capitals of Europe.

WHEEL AND AXLE, the second of the Mechanical Powers (q. v.), is a modification of the Lever (q. v.). Its most primitive form is a cylindrical axle, on which a wheel, concentric with the axle, is firmly fastened. When employed for raising heavy weights, the weight is attached to a rope which is wound round the axle, and the power is applied either to a rope wound round the grooved rim of the wheel, or to a handle fixed at right angles to the wheel's rim (in the latter case, the wheel may be dispensed with, unless it is useful as a conservator of momentum [see FLY-WHEEL], and an ordinary winch substituted). The accompanying figure exhibits a transverse section of the common form of the wheel and axle, and shews that the wheel and axle is neither more nor less than a lever, whose extremities are not points as in the normal form,

but the circumferences of the circles, whose radii are FA and FB. Accordingly, the power and weight are not attached to particular points in these circumferences, but to cords wound round them, and thus the imaginary simple lever, AB (formed by joining the points where the cords become tangents to the circles), is preserved unaltered in position and magnitude. The conditions of equilibrium are, that $P \times AF = W \times FB$, or, since the circumferences of circles are proportional to their radii, that $P : W ::$ circumference of axle : circumference of wheel. When there is no wheel, but only a winch, the circumference described by the power in one revolution is substituted for the circumference of the wheel. The *capstan* and *windlass* are simple and common examples of this mechanical power, and combinations of toothed-wheels, or of wheels from one to another of which motion is communicated by an endless band, are compound illustrations of the same. See WINDLASS.

WHEEL-ANIMALOULE. See ROTATORIA.

WHEEL, BREAKING ON THE, a very barbarous mode of inflicting the punishment of death, formerly in use in France and Germany, where the criminal was placed on a carriage-wheel, with his arms and legs extended along the spokes, and the wheel being turned round, the executioner fractured his limbs by successive blows with an iron bar, which were repeated till death ensued. There was considerable variety in the mode in which this punishment was inflicted, at different times and in different places. By way of terminating sooner the sufferings of the victim, the executioner was sometimes permitted to deal two or three severe blows on the chest or stomach, known as *coups de grâce*; and occasionally, in France at least, the sentence contained a provision that the criminal was to be strangled after the first or second blow. Mercy of this kind was, however, not always allowed to be shewn to the victims of the wheel: when Patkul, the envoy of Peter the Great, was put to death on the wheel by order of Charles XII. of Sweden, it is said that the officer in command of the guard was cashiered by the Swedish king in consequence of having allowed the head to be struck off before life was extinct in the mangled limbs. The punishment of the wheel was abolished in France at the Revolution; in Germany, it has been occasionally inflicted during the present c., on persons convicted of treason and parricide.

WHEEL'RA, a genus of trees of the natural order *Leguminosæ*, sub-order *Papilionaceæ*. The wood of *W. ebenus*, a native of the West Indies, and of the tropical parts of America, is imported into Britain under the name of *American Ebony*. It is very hard, of a brownish-green colour, takes a fine polish, and is employed by cabinetmakers and musical-instrument makers.

WHEELING, a city, port of entry, and capital of West Virginia, U. S., on the left bank of the Ohio River, and both sides of Wheeling Creek, 40 miles direct, and 92 by river, below Pittsburgh. The city is built at the foot of the hills, which rise to the Alleghanies, and is the terminus of the Baltimore and Ohio, and of the river division of the Cleveland and Pittsburgh railways. The great national road here crosses the Ohio, over which is a wire suspension-bridge, 1010 feet long. The hills around the city are full of bituminous coal, which sells for 1*d.* a bushel. In 1862, there were 55 steamboats, numerous foundries, and other metallurgic works, 4 glass-houses, 5 paper-mills, flour-mills, breweries, tanneries, &c.; and 2 daily newspapers. Pop. in 1860, 14,570.

WHEEL-WORK. The arrangement for conveying motion from one axis to another by means of toothed-wheels, is familiar to every one; it has

been in use since the days of Archimedes, and was in use, probably, for many centuries before; but it is only in modern times that the action of such wheels has been critically examined and understood. To a superficial observer, the action appears to be extremely simple: a tooth of the driver pushes against a tooth of the driven wheel, thereby causing that wheel to turn round; and, since by this turning the teeth must become disengaged, it is requisite that, before one tooth let go, a second tooth of the driver be ready to take hold of another tooth of the driven wheel. For this purpose, it is enough that the distances between the teeth on the two wheels be alike; in other words, that the diameters be proportioned to the number of the teeth.

When two unequal wheels act upon each other, the smaller one turns faster than the larger. Thus, if a wheel with 60 teeth work into one of 20, the latter will turn 3 times as quickly as the former; and it is on this principle that the trains of clock-work are arranged. For example, the *great-wheel* of a common house-clock may have 180 teeth, and may drive a smaller wheel, or *pinion* as it is called, of 15 leaves, and in this case, if the great-wheel turn once in 12 hours, the pinion must turn once in every hour; the axis of this pinion carries the minute-hand. On the same axis the *hour-wheel* is fixed, which may have, say, 96 teeth, and may drive a pinion of 12 leaves. This pinion, then, must turn 8 times per hour, or once in $7\frac{1}{2}$ minutes. On the same axis with this last-mentioned pinion there is fixed the *third-wheel*, having, perhaps, 75 teeth, and this drives a pinion of 10 leaves, which, turning $7\frac{1}{2}$ times as fast, must make one turn per minute. On the axis of this last pinion the *escape-wheel* is fixed. This escape-wheel has 30 teeth, each tooth acting twice upon the pendulum, thus making 60 beats per minute. In such a case as this, there is no difficulty in arranging the numbers of the teeth, and these may be varied in many ways, provided the proper proportions be kept. But in other cases, a considerable amount of skill, and often a great deal of labour, is required for the discovery of the proper numbers. Thus, if it be wished to indicate the moon's age on the dial of a clock, we must have an index turning once in the time between new moon and new moon. This time, which astronomers call a *lunation*, averages 29 days, 12 hours, 44 minutes, and nearly 3 seconds (2-853), and it is by no means an easy matter to find out what number of teeth will produce this motion. The month-wheel would need to turn rather more than 59 times as slowly as the great-wheel of the clock; and if the mean lunation had been 29½ days, without the odd 44 minutes, the thing could have been managed by making a pinion of 8 teeth lead a wheel of 59 teeth, on the axis of which another pinion, say, of 10 teeth is fixed, and made to work a wheel of 50 teeth. But then such an arrangement would go wrong nearly three-quarters of an hour every month, and in three years would indicate new moon a day too early. In order to obtain a better train, we may compute the number of days in 2, 3, 4, 5 lunations until we get nearly a number of half-days. Now, 16 lunations consist of 472 days, 11 hours, 45 minutes, or almost exactly 945 turns of the great-wheel. This proportion can be obtained by causing a pinion of 12 teeth to lead a wheel of 81 teeth, and another pinion also of 12 teeth to lead a wheel of 105 teeth. This arrangement gives an error of one quarter of an hour in 16 months, or hardly an hour in 5 years. If still greater precision be required, we must carry the multiples further: 33 lunations make 974 days, 12 hours, 13½ minutes, or 1949 turns of the great-wheel of the clock; but then this number 1949 has no divisor, and it is quite impracticable to make a

WHEEL-WORK.

wheel of 1949 teeth; so that we must continue our multiples in search of a better train. In this way, when great exactitude is desired, we often encounter an unexpected amount of labour. For reducing this labour, the method of continued fractions is employed, and the toil is further lessened by the use of tables of divisors.

Such calculations have to be made for the construction of orreries, by which the times of the revolutions of the planets are shewn; and engineers have to make them, as when a screw of a particular pitch has to be cut. If, for instance, we have to cut a screw of 200 turns to the French mètre on a lathe having a leading-screw of 4 turns to the English inch, the axis of the lathe must make 50 turns while the screw makes 39 and a fraction, since the mètre is $39\cdot37079$ inches. By applying the method of continued fractions, we discover that, for 2225 turns of the lathe-spindle there must be 1752 turns of the screw; and as these numbers can be reduced into products—viz., 2225 into $5 \times 5 \times 89$, and 1752 into $2 \times 2 \times 2 \times 3 \times 73$, we can easily get trains to produce the required effect. From these illustrations, it is apparent that the computation of the trains of wheel-work is intimately connected with the doctrine of prime and composite numbers.

The general sizes of the wheels and the number of the teeth having been fixed on, the next business is to consider the shape which those teeth ought to have. Now, for the smooth and proper action of machinery, it is essential that the uniform motion of one of the wheels be accompanied by a motion also equable of the other wheel. Two curves have been known to give this quality of equable motion—viz., the epicycloid, formed by rolling one circle upon another, and the involute of the circle traced by the end of a thread which is being wound upon a cylinder, or unwound from it. But the general character of all curves which possess this property has been only lately examined. If it were proposed to construct two wheels which shall have their centres at the points A and B (fig. 1), and the one of which may make 5 turns while the other makes 3, we should divide the distance AB into 8 parts,

Fig. 1.

and assign 5 of these for AC, the radius of the one wheel, the remaining 3 parts for the radius BC of the other wheel. Wheels made of these sizes, and rolling upon each other, would turn equably, and if the circumferences be divided into 5 and 3 parts respectively, the points of division would come opposite to each other as the wheels turned. The circumferences of these circles are called the *pitch-lines*, and the portions of them included between two teeth is called the *distance of the teeth*: the distance, or arc CD, on the one wheel must be equal to the distance CE on the other wheel, in order that the motion may bring the two points D and E together. For a reason that will appear in the sequel, we cannot use wheels with so few as 3 or 5 teeth, and therefore we subdivide the distances CD and CE into some number of parts, say 4, and thus obtain wheels of 20 and 12 teeth instead. Since the tooth of the one wheel must necessarily

come between two teeth on the other, the distance between the teeth must be halved, the one half being given for tooth, and the other half for space.

Having then divided off the pitch-line of the wheel B, as in fig. 2, CD being the distance of the teeth, CG the half-distance, let us sketch any contour, CFGHD, for the shape of a tooth, and let us examine what should be the characters of this outline. In the first place, the form of this outline must be repeated for each tooth; and in the second place, the line should be symmetric from the top, F, of the one to the top, I, of the next tooth, in order that the wheel may be reversible face for face. These obvious conditions having been attended to, let us cut, in thin sheet-brass or other convenient

Fig. 2.

material, a disc having this outline, and let us pin its centre at the point B. Having prepared a blank disc on which the outline of A is to be traced, let us slip it under the edge of the previous one, and pin its centre at the point A. If, now, B and A being held fast, we trace the outline of B upon A, we move each of them slightly, but in the proper proportion forward, and make a new trace upon A, and so continue as far as needed, we shall obtain a multitude of curve lines marked upon A. The line which envelops and touches all these curves is, obviously, the proper outline for the wheel A; and thus it appears, that whatever outline, within reasonable limits, may have been assumed for the teeth of B, it is always possible, by a geometrical operation, to discover the proper corresponding form for the teeth of A. These forms may be called *conjugate* to each other, inasmuch as, that if the disc A were now cut out and used as B has been, the identical form of B would be reproduced.

We may obtain a whole series of wheels, A', A'', A''', &c., from the same original B; and from A, as an original, we may obtain another series, B', B'', B''', &c., having various numbers of teeth. And it has been shewn that any wheel of the series A will work accurately along with any one of the series B. So far well; but then the wheel A of 20 teeth may not be like the wheel B of the same number of teeth. It becomes, therefore, a desideratum to choose the form of the teeth of B in such a manner that its conjugate of the same number of teeth may have the same form; by such an arrangement, we shall obtain a series of wheels, any one of which will work with any other.

If the number of the teeth of B be augmented indefinitely, the outline of the pitch-line will become nearly straight; and so drawing through C (fig. 3) a straight line to touch the pitch-line of A, we shall have the pitch-line of the straight rack, as it is called, which could be worked by any wheel of the series A. The reverse of this rack would work with any one of the series B, and therefore, if the series A and B be identical with each other, the

Fig. 3.

WHEEL-WORK.

rack must be its own reverse. Thus we obtain a very important general result—viz., that if we mark off along a straight line distances, CD, equal to the desired interval between the teeth, and then draw any line CKLMD, consisting of four equal parts, CK, KL, LM, MD, symmetrically arranged, all the wheels obtained from this, as the original, will work into each other; and, moreover, the forms thus obtained answer for internal as well as external teeth.

Being then at liberty to choose any line whatever, subject to the above condition of symmetry, for the figure of the straight rack, we may inquire whether it may not be arranged so as to bring about other desiderata. This line, it may be noted, is not necessarily curved; it may be composed of straight lines, or partly of straight and partly of curved lines.

The general appearance of this wavy line recalls that curve known as the curve of sines, which, indeed, is the simplest known curve, consisting of equal and symmetric undulations, and unlimited in extent. By changing the ordinates in any ratio, say in the ratio of PQ to PR, the waves of the curve may be made shallower or deeper; and on studying the effects of such a change, we discover some new and very important laws concerning the contacts of the teeth of wheels.

Beginning with the curve of sines *proper*, in which the greatest ordinate, SK, is equal to the radius of a circle of which CD is the length of the circumference, it is found that wheels traced from it can only touch each other at *one* point: of course such wheels cannot work, because the solitary contact is now on the back and now on the front of the tooth. In this case, the contour of the tooth crosses the pitch-line at an angle of 45° . On deepening the teeth, still keeping to the same kind of curve, it is found that the wheels begin to touch at more points than one; and when they are made so deep as that the contour crosses the pitch-line at an angle of 65° , there are always three contacts, neither more nor less. If the teeth be still further deepened, the contacts become more numerous; they appear and disappear in pairs, so that with an inclination of, say, 68° , there would be sometimes three, and sometimes five contacts. When it becomes $70^\circ 17'$, there are always five; and with an inclination of $73^\circ 11'$, there are always seven points in contact at once.

Of these points of contact, some are on the sides of the teeth, and others are near the top and bottom; the latter, on account of the obliquity of their action, are of no use in driving; they may be called supplementary, and their number is always one less than the number of useful or working contacts. In the system of seven contacts, four are useful, two of them being forwards, and two backwards, so that two teeth are always in action at once; an arrangement by which a gradual improvement in the equality of the teeth is secured by their wearing.

When two properly formed wheels are put in motion, the points of contact move also, and describe a peculiarly shaped line, the nature of which depends on the character of the primary form adopted for the tooth of the straight rack. Conversely, if this path of the points of contact be first assumed, and the law of motion in it be observed, the form of the tooth of any wheel may thence be obtained; and this leads us to the most convenient way of making the delineation.

In fig. 4, the form of the straight rack and the corresponding shape of the teeth of a wheel of 20 are shown in contact, the depth of the tooth being such as to give five contacts, which in the drawing are at the five points marked 0. If we suppose the rack to be slid upwards, carrying the wheel along with it, the points of contact will

change; and when the motion has been one-eighth part of the interval between two teeth, these points will occupy the positions marked 1. When a

Fig. 4.

motion of another eighth is made, the two upper contacts on the left hand merge into one, and are about to disappear; at the same instant, two new contacts begin at the lower point, marked 2; and thus the motion continues in the order of the numbers marked along the peculiarly shaped path of the points of contact. Those contacts which occur along the crossing lines of the curve, are working

Fig. 5.

contacts; those which happen along the two external arcs, are supplementary. When the form of this path, and the positions of the successive points in it have been obtained by calculation, the outline of any wheel is easily traced geometrically. Figs. 5, 6, and 7 show the path for the system of seven contacts; fig. 5, when the outline of the rack is the curve of sines; fig. 6 when the teeth of the wheels

WHEEL-WORK.

have the involute, and fig. 7 when they have the epicycloidal form. In these figures, C' , C'' , C''' , are the positions of the centres of wheels of 1, 2, 3 teeth.

Fig. 6.

In well-constructed machinery, there should never be fewer than seven contacts in the system, since of these only four are working; and therefore only two teeth are fully engaged; and it is necessary

Fig. 7.

that two teeth be engaged at once, in order that the wearing may tend to remove any unavoidable inequalities of workmanship.

When we attempt to delineate the forms of wheels with few teeth by help of any of these orbits, we find that the contours overlap each other; in such cases, the following tooth of the conjugate wheel effaces, as it were, the trace belonging to the preceding tooth; and the contacts, though still holding good of the geometrical curves, become mechanically impossible. Thus it is that there are limits below which we cannot go in the numbers of the teeth. If the overlapping occur at the shoulder of the tooth, some of the useful contacts are wanting; but when the replication is only at the point of the tooth, the want of the supplementary contact

occasions no inconvenience. An examination of the different cases shews that with seven contacts, the smallest numbers which can be used on the three systems just mentioned are 19, 17, and 11, so that the system of epicycloidal teeth has, in this respect, the advantage over the others. Clock pinions, then, should not have fewer than eleven leaves.

This method of considering the subject was first published by the writer of this article in *A New General Theory of the Teeth of Wheels* (Edinburgh, 1852).

It remains to cut the actual wheels to the shapes thus formed. The essentials of the operation are these: The blank wheel is attached to the axis of a large divided circle, which can be turned round and held in any desired position. A cutter, generally a revolving cutter, is brought down upon the blank, so as to notch out the space between two teeth; this done, the circle is turned round by the proper number of divisions, and another space is cut, and in this way the whole circumference of the wheel is gone over. In order that the work be well done, it is essential that the cutter be truly shaped; and when the edges get blunted by use, it is no easy matter to avoid spoiling the shape in the resharpening. Whatever system be followed, the form of the tooth varies from one number to another, so that the cutter which answers for a wheel of 20 cannot do for one of 30 teeth; and hence, when accurate results are wanted, there must be a cutter for each wheel. In order to avoid the expense of so many cutters, each requiring to be carefully made, the slovenly practice is too often followed of having, perhaps, two cutters, one to be used for pinions, the other for wheels; and the result is the intolerable noise which is so common in mills, and which, if properly understood, should be taken as an indication of unnecessary expenditure of power.

When, as in the wholesale manufacture of clocks and watches, multitudes of wheels are to be cut of one size, careful attention can be given to the shape of the cutter. The labour is economised by binding a considerable number of blanks together on the dividing engine, and ploughing out the teeth of the whole of them at once. For the small wheels, technically called pinions, which cannot conveniently be fixed on the dividing-engine, *pinion-wires* are used; these are wires of brass or steel drawn through holes of the proper shape, and having the leaves running all along them. The watchmaker removes the leaves from those parts where they are not wanted, and thus obtains the pinion and its axle in one piece; in this way he gains the advantages of solidity and economy of workmanship.

Among the many purposes to which wheel-work is applied, it sometimes happens that an unequable motion is wanted. Thus, in the construction of an orrery, it is desirable that while one index turns uniformly to shew the time, another may turn so as to shew the unequal motion of the sun in the ecliptic. In that case, the variations of the velocity are small, and it is enough to divide the teeth unequally, as the slight inequality can hardly affect the working of the apparatus. But when the changes of velocity are considerable, the matter must be more carefully looked into. If we suppose the pitch-lines of two wheels to be uneven, and to roll upon each other without regard to the positions of their centres, the forms of teeth to be arranged upon those pitch-lines may be traced out almost in the manner already explained for round wheels. The pitch-line must be divided into equal distances, and the disc must receive a half-sliding half-turning motion, so that the pitch-line may pass through the point C (fig. 8) always perpendicularly to the line AB, which is the line of centres for round

wheels. The combination of this motion with the proper motion of the points of contact gives true forms for the teeth.

Fig. 8.

Thus, the form of the tooth can be obtained when that of the pitch-line is known. Now, when two discs, turning on fixed centres, touch each other at any point out of the straight line joining these centres, there is a slipping of the one surface over the other; and therefore, in order that the pitch-lines may roll together, they must be so shaped as that the point of contact may be in the line of centres. It can be shown that, for any assumed contour of the wheel A, another contour having its centre at B, and rolling upon A, is possible. But, except in one or two special cases, the working out of the problem has not been accomplished. It will be enough here to mention the single case of elliptic wheels. The action of these is founded on the well-known property of the ellipse, that the sum of the distances of any point in it from the two foci is constant, and that the curve makes equal angles with these two lines. Hence two equal ellipses turning on their foci, when their centres are at a distance equal to the major axis of the ellipse, will roll upon each other; and teeth formed upon these as pitch-lines will work perfectly. In fig. 9, the

Fig. 9.

ellipses have their major and minor axes in the proportion of 5 to 4; with that proportion the focus is at one-fifth part of the major axis from one end; and therefore B, at one part of the revolution, moves four times as fast—at another part, four times as slowly—as A.

Sometimes one of the wheels has to be quite at rest during part of the motion of the other wheel. This is accomplished by causing some part of the wheel that is to be stationary, to bear upon a part of the circumference of the moving-wheel which is concentric with its axis. This is exemplified in the arrangement for counting wheels shown in fig. 10. The object of this apparatus is to count and record the revolutions of the wheel B. As this wheel turns round, a pin E attached to it enters into the slit GH, and thus carries the wheel A round as long as the pin remains in the slit, that is, until the slit GH be brought into the position IK. As soon as E leaves the slit at I, there would be no further connection between the two wheels, and A

could be moved anyhow, altogether independently of B. In order to prevent this, the disc B is made nearly five-sixths entire, and parts of A are scooped out between the slits so as to receive and to fit B. By this means A is prevented from being turned either backwards or forwards until the pin E again come into one of the slits. When this happens, the projecting part at G finds room in the recess F. If there be seven slits, GH, round the wheel A, and if B turn once in twenty-four hours, an index attached to A would shew the days of the week; and the index might be made to be stationary all day, the change being effected during the night. Another example of this kind of interrupted motion is seen in the ordinary dead-beat clock escapement, in which the detaining surface of the pallet is concentric with the axis of the crutch.

Fig. 10.

When the axes are inclined to each other, bevelled wheels are used. Just as common wheels may be regarded as fluted cylinders, bevelled wheels may be described as fluted cones having a common apex. The principles which regulate the formation of the teeth of these are the same as for plane wheels; but the application of these principles is considerably more intricate. Since both the teeth and the spaces between them are tapered, it is impossible to notch out the intervals by means of a revolving cutter. Attempts have been made to construct machinery for planing the teeth by means of a cutter moving in a line towards the apex of the cone, but the complexity of the apparatus, and the slowness of the process, have prevented its introduction; and thus the accurate formation of bevelled wheels has still to be accomplished by hand.

WHELK (*Buccinum*), a genus of gasteropodous molluscs, of the family *Buccinidae*. The shell is ovate, turreted, and more or less ventricose; its mouth ovate, emarginate, or produced into a very short canal below, the outer lip expanded, the inner lip usually thin and smooth within. The operculum is horny. The animal has a broad head, with two tentacula, with the base of which the stalks bearing the eyes are united; the proboscis is large, and the tongue armed with teeth, which are used for the purpose of rasping substances used for food—almost any animal substance being welcome for this use—or for perforating the shells of other molluscs in order to prey upon them. There are about twenty

Whelk (*Buccinum undatum*): a, the eggs.

known species, chiefly found on the coasts of the colder parts of the world. The British coasts produce several species, of which the most abundant is the COMMON W. (*B. undatum*). It occurs from

low-water mark to a depth of 100 fathoms, is sometimes three inches in length, grayish or brownish white, with numerous raised ridges and spiral striae. It is very widely distributed in the northern parts of the northern hemisphere, and is one of the most common molluscs of the arctic regions. It is much used as an article of food, is cooked simply by boiling, and is generally eaten with vinegar and pepper. Great quantities are consumed in London, chiefly by the poorer classes. In former times, whelks would appear to have been more highly esteemed than now. Eight thousand of them were provided for the enthronisation feast of William Warham, Archbishop of Canterbury, in 1504. Yet on some parts of the British coasts, as on those of Scotland, whelks are never eaten, a prejudice existing against them as unsuitable for food. The whelks brought to the London market are mostly obtained by dredging. On the coast of Galloway, where they are used as a bait for catching cod, they are procured by letting down baskets containing pieces of fish in about ten fathoms water. The baskets being taken up next day, are found to contain many whelks which have crept into them to feed on the garbage. The name *W.* (or *Wilk*) is popularly given in Scotland to the Periwinkle, the *W.* being known by that of *Buckie*.—There are more than 100 fossil species of *W.* in the Miocene formations.

WHELK, or BUBUCLE. These are terms used by the older English writers, and by Dr Craigie in recent times, to signify the cutaneous disorder now commonly known as *Acne*. The simple whelk, the black whelk, the inveterate whelk, and the crimson whelk, correspond to *Acne simplex*, *A. punctata*, *A. indurata*, and *A. rosacea* of the more modern dermatologists. The symptoms of the crimson whelk, or fiery-face, must have been carefully observed by our great dramatist before he could have written Fluellen's graphic description of Bardolph: 'His face is all bubukles, and whelks, and knobs, and flames of fire, but his lips plows at his nose; and it is like a coal of fire, sometimes plue, and sometimes red.'—*King Henry V.*, act iii. sc. vi. The *Chin-whelk* is the old name for the affection now known as *Sycosis* or *Mentagra*.

WHEWELL, WILLIAM, D.D., was born in 1795 at Lancaster. His father intended him for his own trade—that of a joiner; but the boy having excelled at school in mathematics, was persuaded to go to Cambridge. He entered at Trinity College, and graduated (Second Wrangler, and Second Smith's Prize-man) B.A. in 1816. He became a Fellow, and afterwards a Tutor of Trinity, where also, for many years, he acted as a successful 'coach,' or private tutor. In 1820, he became a Fellow of the Royal Society. Between 1828 and 1832, he was Professor of Mineralogy in Cambridge; and between 1838 and 1855, Professor of Moral Theology, or Casuistry. In 1841, he was appointed Master of Trinity; and in the same year, he was President of the British Association at its meeting at Plymouth. He was also, for a time, President of the Geological Society. In 1855, he became Vice-chancellor of the university of Cambridge. He died at Trinity (1866), in consequence of injuries sustained through a fall when riding.

W., when he acted as a private tutor, produced several text-books on mathematical subjects (one of which, his *Dynamics* (1823), is deservedly admired), which were for a time popular, but may now be said to have been superseded. He also contributed a variety of papers to the Transactions of learned and scientific societies, and to scientific journals, and to the reviews. In some of these, he treated of such subjects as the Tides, Electricity, Mag-

netism, and Heat; in others, of abstruse and recondite subjects, literary, historical, and metaphysical. Later in life, while he continued to write papers of this class, he concentrated his powers mainly on the production of large works. Among the most important of his books are—*Astronomy and General Physics considered in Reference to Natural Theology*, being the third Bridgewater Treatise (Lond. 1833); *History of the Inductive Sciences, from the Earliest to the Present Times* (3 vols., Lond. 1837); *The Philosophy of the Inductive Sciences, founded upon their History* (2 vols., Lond. 1840); *The Elements of Morality, including Polity* (Lond. 1855). Among his other works are—*The Plurality of Worlds*, which had considerable popularity from its subject; *The History of Scientific Ideas, Novum Organum Renovatum*; *Notes on the Architecture of German Churches*; *Lectures on the History of Moral Philosophy in England*; *Indications of the Creator*; translation of Goethe's *Herman and Dorothea*; translation of Auerbach's *Professor's Wife*; translation of Grotius's *Rights of Peace and War*; a translation of Plato's works; and *The Platonic Dialogues for English Readers*. Besides these books, he published many essays, as yet uncollected. His last composition, so far as is known, is an attack on Comte and Positivism, which appeared in *Macmillan's Magazine* after his death.

W.'s acquisitions were most various; it would have been sufficient occupation for the lives of most book-worms to have made them. His writings, again, were so various and voluminous, it might be thought sufficient employment of the life of a mere clever book-maker to have produced them. *W.* was neither bookworm nor bookmaker. A clear-headed student, he was always increasing his stock of knowledge; a vigorous and independent thinker and writer, he was always giving forth the results of his studies to the public; and having thus proceeded during a long life of almost uninterrupted good health, he may be taken as illustrating what at the best may be achieved by a man of ambition, ability, and unflagging industry, without genius. He was nowise superficial, like many pretenders to encyclopedic knowledge; he was really master of all that could be learned on a great many subjects. It has been said of him, 'knowledge was his forte, omniscience his foible;' but it is absurd to suggest that a man can have and strain after too much knowledge, if it be, as his was, thorough knowledge. His chief ambition was to grasp, survey, and co-ordinate the sciences; and he did excellent service both to science and history in the effort to gratify it. The task suited one of his extraordinary acquisitions, good sense, and philosophic comprehension. Had he been a man of more imagination and ingenuity, he might, of course, have been better employed in endeavouring to advance some single science. As he was, this was beyond him: he made some original investigations; but the results must be pronounced unimportant.

W. was a large, strong, erect man, with a red face and a loud voice. He was an effective preacher and lecturer, though in both characters wanting in that 'something' which wins and rivets the hearer. He was accused of being arrogant; and his general bearing gave colour to the charge. A story, long current, may be told as illustrating at once his varied knowledge and his personal relations to his brother Fellows. He used so to overwhelm with his learning the company at the Fellows' table and in the Combination Room, that a conspiracy was formed to put him down. Some Fellows got up a knowledge of Chinese music from scattered articles in old reviews, with which they presumed he would be unacquainted. They then made Chinese music

the subject of, as it were, a casual conversation at table. For a time, contrary to his usual habit, he took no part in the conversation. When they had about exhausted themselves, however, he remarked: 'I was imperfectly, and to some extent incorrectly, informed regarding Chinese music when I wrote the articles from which you have drawn your information.' They were caught in their own trap, and had, as on other occasions, to submit to be instructed.

WHEY. When any substance, possessing the property of coagulating casein, is added to milk, the coagulated casein separates in flakes and clots, and sinks to the bottom, constituting what is termed the *curds*; while the supernatant, straw-coloured fluid is known as the *whey*. Cheese-making affords the principal source of whey, which, thus obtained, forms, like butter-milk, a very valuable kind of drink. The whey of goat's milk is regarded as specially beneficial, and in Switzerland and elsewhere, large establishments have been set up for carrying out the *whey-cure*, either alone or in association with the grape-cure. There can be no doubt that, were the cases judiciously selected, much good, in the way of eliminating morbid matter, might be effected in a few weeks by confining the patients to a diet of brown bread, grapes, and whey; while, on the other hand, many diseases might be much aggravated by that treatment. In ordinary medicine, we recognise several useful varieties of whey, as: White-wine whey, prepared by the addition of sufficient sherry to a tumbler of heated milk to coagulate the casein. On decanting off the whey from the curds, and sweetening, we obtain a favourite sudorific draught, which may be taken with advantage as a sudorific at bedtime, whenever there is a threatening of incipient cold in the head. *Cream-of-tartar whey* and *nitre-whey*—the former prepared by boiling 100 grains of cream of tartar in a pint of milk, and the latter by the similar use of nitre—act in the same way as wine-whey, but more powerfully. *Tamarind whey* has been already described in the article on that fruit.

WHIG AND TORY, the names which for the last two centuries have been popularly applied to two opposite political parties in Great Britain. Both were at first names of reproach. *Whig* was originally a nickname of the peasantry of the Western Lowlands of Scotland, said by some to be derived from a word or sound used by them in driving their horses; by others, from *whig*, 'an acetous liquor subsiding from sour cream.'—*Jamieson*. Its next application was to the bands of Covenanters, chiefly from the west of Scotland, who, subsequently to the murder of Archbishop Sharpe, took up arms against the government, and after gaining some successes in encounters with the king's troops, were defeated at Bothwell Bridge. Thence the name Whig (or Whigmore) came to be fastened, first, on the whole Presbyterian zealots of Scotland, and afterwards on those English politicians who shewed a disposition to oppose the court, and treat Protestant nonconformists with leniency. The word *Tory*—said to be derived from *tora, tora*, in Irish, 'give, give,' or 'stand and deliver'—was first given to certain bands of outlaws, half-robber, half-insurgent, professing the Roman Catholic faith, who harassed the English in Ireland; and was thence applied reproachfully to all who were supposed to be abettors of the imaginary Popish plot; and then generally to persons who refused to concur in the exclusion of a Roman Catholic prince from the throne. These two nicknames, which came into use about 1680, immediately became familiar words, and have since been retained as designations of two opposite political sides—the Tories being,

generally speaking, the adherents of the ancient constitution of England without change, and the supporters of regal, ecclesiastical, and aristocratic authority; while the Whigs have been the advocates of such changes in the constitution as tend in the direction of democracy. The most sweeping constitutional change of the present century which the Whigs have carried is the Reform Bill of 1832. Each party, while preserving within certain limits a general consistency of purpose, has undergone many changes in its principles, professions, and modes of action with the altering circumstances of the country; and among persons who have been considered adherents of each side at any given time, there have seldom been wanting a variety of more or less distinctive shades of opinion. A division in the ranks of either party has often led the more moderate section of that party to coalesce with the opposite side; and at other times, the extreme party of innovation, dropping their connection with the Whigs, have adopted another name, as when those politicians whose desire was to have the whole institutions of the country remodelled on a democratic basis, assumed the designation of *Radical Reformers* or *Radicals*. See also **CHARTISM**. For a considerable time after the Reform Bill, the governing section of the Whig party were more disposed to maintain the principles of the changes already made, than to insist on further constitutional changes; and the principles maintained by Whigs and Tories sometimes approximated so closely that the difference seemed more one of men than of measures. Sometimes one party, sometimes the other, has appeared as the advocate of measures which have proved beneficial. In the agitation for the repeal of the Corn-laws, which lasted from 1841 to 1846, the Tories were ranked on the side of protection, and the Whigs of free trade; but the relations of the two parties had been the reverse at a former period, when Mr Pitt's advocacy of free trade between England and Ireland was opposed by the manufacturers of Lancashire, who succeeded in getting his measure postponed. During the last twenty years, the names *Liberal* and *Conservative* have to a great extent superseded the former party designations of Whig and Tory.

WHIMBREL (*Numenius phaeopus*), a bird of the same genus with the Curlew (q. v.), and much

Whimbrel (*Numenius phaeopus*).

resembling it in form, plumage, and habits, but of smaller size, and with a bill considerably shorter in proportion. The female, which is larger than the male, is about eighteen inches in length, the bill being about three inches and a half. The plumage of the W. is of a bright ash colour, with streaks of brown on the neck and breast. The W. is a very

widely distributed bird, being found from the north of Africa and of India to the arctic regions of Europe and Asia. It occurs also in Japan. It is a bird of passage, and visits Britain chiefly in the course of its spring and autumn migrations. A few whimbrels breed in Shetland; but the number is diminishing, the eggs being in great request as a delicacy. The flesh is also highly esteemed.

WHIN. See **FURZE**.

WHIN-CHAT (*Saxicola rubetra*; see **CHAT**), a bird very similar to the Stone-chat (q. v.), a summer visitant of Britain and of the northern parts of Europe. It is widely diffused over the British islands in summer, but nowhere very abundant. The head, sides of the neck, and upper parts of the body

Whin-chat (*Saxicola rubetra*).

are blackish brown, each feather bordered with rusty yellow; an elongated streak of white above each eye; the throat and a streak on each side of the neck white; the breast, rust-colour; a large white spot on each wing; the tail white, except the two middle quills and the tip, which are blackish brown. The colours of the female are less distinct than those of the male. The W. frequents fuzze (or whin) bushes. Its song is pleasant.

WHINSTONE (probably from the same root as *whine*, and meaning the sounding, ringing stone), a name popularly given in Scotland to any hard and compact kind of stone, as contra-distinguished to sandstone or freestone, and rocks of slaty structure. Thus, in most parts of Scotland, it is the common appellation of basalt, greenstone, and other trap rocks, whilst in some districts it is applied to granite.

WHIPPING. Corporal punishment by whipping, public as well as private, was formerly often awarded by the criminal law of England for minor offences, such as petty larceny, and was not unfrequently superadded to some other punishment, such as imprisonment or the pillory. In early times, and by the usage of the Star Chamber, whipping could not be competently inflicted on a gentleman.—In Scotland, sentence of whipping was also frequent, the terms of the sentence sometimes requiring it to be repeated at intervals and in different parts of the kingdom. In the last century, the Scottish burgh magistrates were in the habit of awarding sentence of whipping on summary convictions for police offences, such as broils, street outrages, and the keeping of disorderly houses; but in modern practice the competency of inflicting this sentence at common law without the intervention of a jury has been made matter of doubt. Whipping used not long since to be an occasional addition to the sentence of the Juxtiary Court on persons convicted of aggravated assaults.

The infliction of corporal punishment by whipping on women was prohibited by act 1 Geo. IV. c. 57. In act 5 and 6 Vict. c. 57, directed against attempts to injure or alarm the Queen by discharging fire-

arms in her Majesty's neighbourhood, or otherwise, the infliction of public or private whipping not exceeding three times is made part of the punishment. Act 26 and 27 Vict. (not applicable to Scotland) authorises whipping in addition to penal servitude in convictions for robbery, assaults with intent to rob, and attempts to strangle or render insensible with the view of committing a crime, the number of strokes not exceeding 50 in the case of an adult, or 25 in the case of a boy under 16. Recent legislation, both in England and Scotland, has made various provisions for the infliction of this description of corporal punishment on juvenile culprits. Whipping of boys under 16 for various offences is authorised by the English Criminal Consolidation Act (1861); it being provided that the whipping is to be private, and not repeated more than once, and the instrument of punishment to be specified in the sentence. Similar provisions, with some additional ones, occur in 25 Vict. c. 18 as to the mode in which the same punishment is to be administered on summary convictions by justices. In Scotland, the Prisons Amendment Act, 14 and 15 Vict. c. 27, and the act 23 and 24 Vict. c. 105, which superseded it, authorise the whipping of boys under regulations made by the Lord Advocate, and approved by the Secretary of State. By act 25 Vict. c. 18, no person above the age of 16 can now be whipped in Scotland for theft, or any crime against person or property. It is a very general impression among magistrates that whipping to the moderate extent allowed by 26 and 27 Vict. has had a most salutary effect in repressing certain kinds of outrage, the apprehension of mere imprisonment, or even of penal servitude, having little efficacy in the way of prevention. Thus, personal chastisement, the oldest form of punishment for crime, has to a certain extent been resumed in the administration of the criminal law.

As regards corporal punishment in the army and navy, see **FLOGGING**.

WHIP-POOR-WILL (*Caprimulgus* or *Antrostomus vociferus*), a species of Goatsucker (q. v.), a native of North America, common in the eastern parts of the United States. It receives its popular name from the fancied resemblance of its notes to the words *Whip poor Will*. It is about ten inches

Whip-poor-Will (*Caprimulgus vociferus*).

long, the plumage very like that of the European goatsucker, much mottled and indistinctly marked with small transverse bands, the top of the head streaked with black, a narrow white collar on the throat. The bristles at the base of the bill are very stiff, and more than an inch long. This bird is seldom seen during the day, but seeks its food by night, catching moths, beetles, and other insects on the wing. Its flight is near the ground, zigzag, and noiseless. Its notes are heard only during the

night, and are clear and loud, so that when a few of these birds are close at hand, the noise is such that those unaccustomed to it cannot sleep. In the more southern parts of the United States, the W. is replaced by a larger species, the Chuck-Will's-Widow (q. v.), and on the Upper Missouri and to the west by a smaller one (*C.* or *A. Nuttalis*).

WHIRLPOOL, a circular current in a river or sea, produced by opposing tides, winds, or currents. It is a phenomenon of rare occurrence on a large scale, but illustrations in miniature may be noticed in the eddies formed in a river by means of obstacles or deflections. The two celebrated sea-whirlpools, Charybdis (see *SCYLLA*) and Malström (q. v.) are now known to be merely 'chopping seas,' caused by the wind acting obliquely on a rapid current setting steadily in one direction while the tide is flowing, and in the opposite direction when it is ebbing. During calm weather, neither of these so-called whirlpools is dangerous for large ships, but when the current and the wind are strongly in opposition, the broken swell is so violent and extensive in the Malström as to founder large ships, or drive them against the rocks. Though in neither of these two cases, formerly so much dreaded, is there any vortical action, instances of such action do actually occur in various localities, as in the whirlpool of Corrievrekin (q. v.), and in some eddies produced by opposing winds and currents among the Orkney Islands.

WHIRLWINDS AND WATERSPOUTS. Whirlwinds differ in many respects from the storms described in the articles *STORMS* and *TYPHOONS*. They seldom continue longer than a minute at any place, and sometimes only a few seconds; their breadth varies from a few yards to nearly a quarter of a mile; during their short continuance, the changes of the wind are sudden and violent; and the barometer is not observed to fall.

Dust Whirlwinds.

(From Baddeley's *Whirlwinds and Dust-storms of India*.)

The direction of the eddy of the whirlwinds, especially when the diameter is very small, differs from the rotation of winds in a storm, in that it may take place either way—right to left, or left to right—according to the direction of the stronger of the two winds which give rise to the whirlwind. Thus, suppose it to arise from a north wind blowing side by side with a south wind, and to the west of it,

then, if the north wind be stronger, the whirl will be north, west, south, and east; but it will be in a contrary direction if the south wind be the stronger. Whirlwinds often originate within the tropics during the hot season, especially in flat sandy deserts; these becoming unequally heated by the sun, give rise to ascending columns of heated air. In their contact with each other, the ascending currents result in eddies, which draw up with them large clouds of dust, and the whole is borne forward by the wind that may happen to be blowing at the time. This is the origin of the *dust whirlwinds* of India, which have been admirably described and illustrated by P. F. H. Baddeley. These dust-storms are frequent in dry warm regions; and in the case of the *Simoom* (q. v.), which may be regarded as a succession of such whirlwinds, they appear on a scale of the most appalling grandeur.

Extensive fires, such as the burning of the prairie in America, and volcanic eruptions, also cause whirlwinds, by the conflicting currents of heated air they occasion; and these, as well as the whirlwinds already mentioned, are generally accompanied with heavy rains, hail, and electrical displays. Whirlwinds are also of frequent occurrence in France, doing great damage to the vineyards and other crops; but in Great Britain they seldom occur.

Waterspouts are whirlwinds occurring on the sea or on lakes. When fully formed, they appear as tall pillars of cloud stretching from the sea to the sky, whirling round their axes, and exhibiting the progressive movement of the whole mass precisely as in the case of the dust-whirlwind. The sea at the base of the whirling vortices is thrown into the most violent commotion, resembling the surface of water in rapid ebullition. It is a popular fallacy that the water of the sea is sucked up in a solid mass by waterspouts, it being only the spray from the broken waves which is carried up. Observations of the rain-gauge conclusively prove this.

What are sometimes called *waterspouts on land* are quite distinct from these phenomena. They are merely heavy falls of rain of a very local character, and may or may not be accompanied with whirling winds. They generally occur during thunder-storms, being quite analogous to severe hail-storms, from which they differ only in point of temperature. Also all the moisture that falls is the result of condensation; whereas, in the true waterspout, the rain is mixed with spray which has been caught up from the broken waves, and carried aloft by the ascending currents of the whirlwind.

WHISKY (Gaelic, *uisge*, water; *uisge-beatha*, commonly written *usquebaugh*, water of life), a spirit made by distillation from grain of any sort, and from other materials, as buckwheat, potatoes, and even turnips. The best is made from barley after it has been malted; but whisky of good quality is also made from rye in some parts of the United States; and oats, rye, rice, millet, buckwheat, &c. are the materials from which the inferior sorts are obtained. Whisky is manufactured almost exclusively in Scotland, Ireland, and the United States of America; the produce of the first-named country being generally considered best in quality. The manufacture of whisky (as well as of other spirits) in the United Kingdom is placed under the surveillance of the Excise, and by act of parliament (6 Geo. IV. c. 80) the distiller is subjected to numerous stringent regulations, with a view to prevent the evasion of the very high duties. The mode of manufacture is described under *DISTILLATION*. The quantity distilled, according to the statistics for 1865, was, in Scotland, 13,445,752 gallons; and in Ireland, 5,646,947 gallons; and the proportion of this which paid duty was, in Scotland, 7,378,931 gallons;

WHISKY—WHIST.

and in Ireland, 5,258,232 gallons; the remainder being either exported or retained in bond. There are doubtless no better subjects for taxation than spirits, since they may in general be looked upon as purely articles of luxury; but the principle attended to in fixing the amount of duty to be charged is different from that which is followed in fixing the tax on other superfluities. The object of other taxes is simply to raise revenue; in the case of whisky and other intoxicating drinks, the aim is also, and perhaps chiefly, to check their consumption.

The pernicious effects of the excessive use of ardent spirits were prominently brought under the notice of parliament about the commencement of the 18th c.; and by the imposition of the enormous duty of 20s. per gallon, besides a heavy tax on the retail dealers, it was attempted to put a complete stop to the consumption except by way of cordial or medicine. The effect produced by this oppressive enactment was not such as was anticipated; respectable dealers withdrew from a trade which was now unprofitable, and their places were supplied from the profligate and criminal classes, who had not the slightest objection to break the law and run the risk of fine. Smuggling flourished extensively; the officers of justice were assaulted, and violently prevented from discharging their duty; and informers, to whom a high reward was held out by government, were hunted down as deadly enemies of the community. The act soon became a dead letter, and in 1742 it was repealed, and a moderate duty imposed.

In Ireland, the repressive system was carried to a still greater extent, a fine being imposed on the district in which illicit distillation was detected, and the unfortunate operatives subjected to transportation for seven years. The effect of this attempt at repression was similar to what occurred in England; of 10,000,000 gallons annually (1820—1823) consumed, only about 3,000,000 paid duty; and frequent and murderous conflicts took place between the smugglers and their abettors on one hand, and the excise-officers and military on the other, and much of the country was almost in a state of rebellion. Scotland's history in this respect is similar to that of her two neighbours. Illicit distillation flourished afresh at each rise of the duty; lawless violence was resorted to freely, the common people invariably sympathising with or aiding the smugglers; and in many cases the officers of excise were effectually intimidated. The difficulty of dealing with illicit distillation in Ireland and Scotland led to the adoption, beginning with 1823, of a considerably lower duty in these two countries than in England. The following table exhibits the relative rates of duty on spirits in England, Scotland, and Ireland at different periods during the present century:

| | England. | Scotland.* | Ireland. |
|-----------------|----------|------------|----------|
| | s. d. | s. d. | s. d. |
| 1802, | 5 4½ | 3 10½ | 2 10½ |
| 1803, | 8 0 | | 3 7 |
| 1804, | | 5 10 | |
| 1811, | 10 3 | 8 0½ | 2 6½† |
| 1815, | | 9 4½ | 6 1½ |
| 1817, | | 6 2 | 5 7½ |
| 1819, | 11 8½ | | |
| 1822, | | 2 4½ | 2 4½ |
| 1826, | 7 0 | 2 10 | 2 10 |
| 1830, | 7 6 | 3 4 | 3 4† |
| 1840, | 7 10 | 3 8 | 2 8 |
| 1853, | | 4 8 | 3 4 |
| 1863, | 8 0 | 8 0 | 6 2 |
| 1868, | 8 0 | 8 0 | 8 0 |

* The duty differed in the Highlands and Lowlands till 1814, the difference varying from 6d. to 2s. 5d., giving rise to a considerable amount of smuggling.

† For two years—afterwards doubled.

‡ Reduced to 2s. 4d. after 1834.

In 1858, the duty on spirits was equalised in the three kingdoms, thus putting a stop to the systematic and (as was found) irrepressible practice of smuggling spirits from Scotland and Ireland into England, which had prevailed for a long time previously. The duty was in 1860 raised to 10s. per imperial gallon, at which rate it still (1867) remains. This rate was increased to its present value by Mr Gladstone with the avowed intention of diminishing the consumption of ardent spirits within the United Kingdom; and though it does not seem to have produced much effect, neither has it, as was always the case formerly, much increased the practice of illicit distillation, owing, in all probability, to the improved moral tone of the population, and the more thorough execution of the law. It has, however, had a most deleterious effect in increasing the temptation to produce a cheaper drink for the poorer classes by largely diluting it with water, and introducing sulphuric acid, sulphate of copper, and other noxious materials to maintain a 'biting' flavour. A great part of the whisky distilled in Scotland and Ireland is bought by the English rectifiers, to be converted into British gin; part is also sent to France, from which it comes back as brandy. In the United States, the process of manufacture is the same as in this country, and is largely carried on in New York, Pennsylvania, Ohio, Illinois, Indiana, Kentucky, and, in a less degree, in Tennessee, Missouri, and California. The annual consumption of whisky alone in the United States does not fall far short of £4,000,000 in value. A large quantity is also rectified, and reduced to alcohol, and much is exported and in part returned in the form of 'French brandy,' 'Hollands,' &c. The 'Monongahela' whisky of Pennsylvania, and that from Bourbon County, Kentucky, are considered the best in the United States, and always fetch a high price.

WHIST, a game at cards, believed to be of English origin; probably a development of the game of *trump* (or, more properly, *triumph*), which was played in England at least as early as the time of Henry VIII. Trump (or triumph) is mentioned in a sermon delivered by Latimer on the Sunday before Christmas 1529. The game of trump is also mentioned by Shakspeare punning on the word triumph, (see Douce's *Illustrations*, and *Antony and Cleopatra*, act iv. scene 12). The game of whist is not mentioned by Shakspeare, nor by any writer of the Elizabethan era.

The earliest mention of *whist* (or, more properly, *whisk*) is in the poems of Taylor the Water-poet (1621). In the first edition of Cotton's *Compleat Gamester* (1674), whist has no place; but it is added in the second edition (1680) as a game 'commonly known in England.' Cotton says that 'the game of whist is so called from the silence that is to be observed in the play;' and this derivation of the word has been generally accepted, and was adopted by Dr Johnson, to the extent of explaining whist to be a game requiring silence. But if the original name of the game was *whisk*, Cotton's derivation fails. The derivation from an interjection signifying silence seems to have been taken for granted somewhat hastily.

The game was formerly played nine-up. The change to ten-up seems to have taken place in the first quarter of the 18th century. Whist played ten-up is called *long whist*. About 1785, the experiment of dividing the game into half was tried, and *short whist* was the result. The short game soon came into favour; and in 1864, the supremacy of short whist was acknowledged by nearly all the London and by many country clubs, the clubs adopting as their standard the laws of short whist as

framed by committees of the Arlington and Portland.

Edmond Hoyle, the first writer of any celebrity on whist (commonly called the father of the game), was born in 1672—it is said in the neighbourhood of Halifax, Yorkshire, but on insufficient grounds. He was educated as a barrister. He first published his *Short Treatise* about 1742. He used to give lessons in whist at a guinea a lesson. His *Short Treatise* ran through many editions (16 or more) during his lifetime; and since his death, his works have been reproduced in numberless ways. Hoyle died in Welbeck Street, Cavendish Square, on August 29, 1769, aged 97.

The game of whist is played by four persons, two being partners against the other two. The partners sit opposite to each other. The partnership is determined by cutting. The two lowest are partners against the two highest, and the lowest has the deal and the choice of seats and cards. In cutting, the ace is reckoned lowest. Each player has a right to shuffle the pack once before each deal, the dealer having the privilege of a final shuffle. The shuffling being concluded, the player to the dealer's right cuts the pack. The dealer having reunited the packets, is bound to deal the cards one at a time, to the players in rotation, beginning with the player to his left. He turns up the bottom card (called the trump card). The deal being completed, the players sort their cards, and the player to the dealer's left (or leader) plays a card face upwards on the table. The other players follow in rotation, being bound to follow suit if they can. When all have played, the trick is complete. It is then gathered and turned over by the winning side. The highest card wins the trick. The ace is highest in playing; and the other cards reckon in the order, king, queen, knave, ten, &c., down to the deuce, or two, which is lowest. If any player cannot follow suit (i. e., has none of the suit led), he may play any card he pleases. If he plays a card of the suit turned up (called trumps), he wins the trick, unless another player also, having none of the suit led, plays a higher trump. The player who wins the trick becomes the leader for the next trick, and so on till the whole hand (consisting of 13 tricks) is played out.

After scoring, the mode of which will be presently described, the player to the last dealer's left deals in his turn; and in subsequent deals, each player deals in turn, the rotation going to the left.

After the hand is played out, the scoring is thus performed: the side who win more than six tricks reckon one for each trick above six; and the side who either separately or conjointly hold more than two of the following cards, ace, king, queen, and knave of trumps (called honours), reckon as follow: If they hold any three honours, they score two (that being the excess of their honours over their opponents'); and similarly if they hold four honours, they score four. At short whist, players who are at four, cannot score honours. The same at long whist with players who are at nine. The side who thus in one hand or in a succession of hands first reach five at short whist, or ten at long, score the game.

A game at short whist is called a single, if the adversaries have already scored three or four; a double, if they have scored one or two; a treble, if they have scored nothing. A game at long whist is a single, if the opponents have scored five or more; a double, if they have scored less. There is no treble at long whist.

A rubber consists of the best two games out of three. If the same players win two consecutive games, the third is not played. The winners of the

rubber win in points the value of the games they have won, and where the rubber has consisted of three games, the value of the loser's game is deducted. And whether two or three games are played, two points are added for the rubber at short whist; one point for the rubber at long. Thus, if at short whist A B (partners) win a single and a double, they win three points on the games, and they add two for the rubber, making five points. Had A B won the same, but C D (their opponents) won a treble, they would have to deduct three points, the value of the opponents' game, and would only win two points. Long whist is now seldom played.

Whist is a mixed game of chance and skill. The chance resides in the holding honours, and the fortune of having high cards dealt in the hand. The skill consists in the application of such knowledge as shall, in the long run, turn the chances of the cards in the player's favour. At the commencement of the hand, the first lead presents a problem of almost pure chance; but as the hand proceeds, observation of the fall of the cards, inference therefrom, memory and judgment come in, so that towards the end of the hand we are often presented with a problem of almost pure skill. It is these ever-varying gradations of skill and chance that give the game its chief interest as a scientific pastime.

In order to become a skilful player, it is necessary to bear in mind that the game is not one of any given player's hand against the other three, but a combination of two against two. In order that two partners shall play their hands to the best advantage, they must strive, as much as possible, to play the two hands as though they were one. To this end, it is advisable that they should pursue some uniform system of play, in order that each partner shall understand the plans of the other, and so be placed in the most favourable position to assist him in carrying them out. The experience of the last hundred years has developed a system of play tending to this result. Of this we proceed to give an epitome.

The first, or, as it is commonly called, the *original* lead should be from the player's strongest suit. A strong suit is one that contains either a large number of cards (four or more) or several high cards. The suit containing the largest number of cards (numerical strength) is the one to be mostly preferred. The object aimed at in opening with the strongest suit is to exhaust the cards of that suit from the other hands. When this object is accomplished, the cards of the suit which remain in the leader's hand (called long cards) obtain a value which does not intrinsically belong to them. They often become of great service, for when led, they either compel the adversary to trump, or they make tricks. And when trumps are all out, the player who has the lead makes as many tricks as he has long cards.

On the other side, by opening weak suits, there is considerable risk of sacrificing partner's strength, and of leaving long cards with the opponents.

Some players are prone to lead single cards, but experience shews that weak leads, as a rule, do more harm than good. Sometimes a trick or two is made by playing a trumping game; but the chances are that such tactics sacrifice partner's hand, and clear the suit for the adversaries.

The proper card of the strong suit to lead is, as a rule, the lowest. The intention is for the third player to play his highest, and so to assist in clearing his partner's strong suit. Moreover, if the leader keeps the best cards of his suit in his own hand, he has a fair chance of getting the lead again when his suit is nearly or quite established. But with ace and four or more small ones, it is considered best to begin with the ace, lest the ace is trumped, second

round. Also, with a strong sequence in the strong suit, it is best to lead one of the sequence first, lest the adversaries win with a very small card. The following are the principal leads from sequences :

- From ace, king, queen—lead king, then queen.
- From ace, king, and small—lead king, then ace.
- From ace, queen, knave—lead ace, then queen.
- From king, queen, knave, and more than one small—lead knave.

From king, queen, knave, and one small—lead king.

- From king, queen, and small—lead king.
- From king, knave, ten, nine, &c.—lead nine.
- From king, knave, ten, and small—lead ten.
- From queen, knave, ten, and small—lead queen.
- From knave, ten, nine, and small—lead knave.

After the first trick, the lead may remain with the first leader. His best play, as a rule, is to continue his suit. If the lead falls to another player, his play, as a rule, will be to open his best suit ; and so on. If the lead falls to the first player's partner, he has choice of two modes of play. If he has a good strong suit of his own, as, for instance, one of those in the list above, and containing four or more cards, he would, as a rule, open it ; if not, he would, as a rule, do well to continue the suit his partner first led ; or, as it is commonly called, to return his partner's suit. The object is to strengthen partner by assisting to clear his strong suit.

In returning a suit, if the player has only two cards of it remaining in his hand, he should return the highest ; if more than two, the lowest. The exception is, if he has the winning card, he should return that irrespective of the number of other cards in the suit. The reason of this rule is that, with but two cards of the suit remaining, the player is weak in the suit, and he is therefore bound to sacrifice his good card to support his partner. But with three or more remaining after the first round, he is strong, and is therefore justified in calling on partner to support him.

This rule of play is most important. It should be carefully observed with even the smallest cards, as it enables partner to count the situation of the remaining cards. For example : A leads a suit in which C (his partner) holds ace, three, and two. In returning A's suit, after winning with the ace, C is bound to return the three, and not the two. When C's two falls in the third round, A will know that his partner has no more of the suit. But suppose C's cards to be ace, four, three, and two. In returning the suit, C is bound to choose the two. Then after the third round, A will conclude with certainty that C has at least one more card in the suit.

Late in a hand, the considerations with regard to the lead vary. If there is no indication to the contrary, it is best for each side to continue the suits originally opened by them. But the fall of the cards may shew that it is disadvantageous to persevere in the suits first led. In such cases, the player must have recourse to other and weaker suits. The general rules to be observed here are—to choose a suit in which there is reason to infer that the right-hand adversary is weak ; or—but this is less favourable—one in which the left-hand adversary is strong. In either case, if the suit chosen contains but three cards, none higher than knave, or only two cards, it is generally right to lead the highest.

The second player, as a rule, should play his lowest card, in order to preserve his strength in the leader's suit. The first trick in the suit is left to partner, who has an even chance of holding a better card than the third player. But if the second hand has a strong sequence, he should play the lowest of the sequence, by which partner's hand may be saved, and a high card still remain over the original leader.

The following are the principal sequences :

- With ace, king, queen—play queen.
- With ace, king, &c.—play king.
- With king, queen, knave—play knave.
- With king, queen, &c.—play queen.
- With queen, knave, ten—play ten.
- With queen, knave, and one small—play knave.

When a high card is led, it is sometimes advisable for the second player to cover it with a higher one. The shortest rule is to put an honour on an honour, if with but two or three cards of the suit. With king or queen, and four of the suit, it is better to pass an honour led.

When the second hand has none of the suit led, he should, as a rule, trump, if he has but two or three trumps ; but he should not trump a losing card if he has more than three trumps, the reason of which will be explained when treating of the management of trumps.

The third hand, as a rule, plays his highest card in order to support partner in his suit. The exceptions are, with ace, queen, &c., the queen is to be played ; and if partner has begun with a high card, it is often right to pass it.

The management of trumps varies according to whether the player is strong or weak in them. If strong (i. e., with four or more), they should not be used for trumping, if it can be avoided, but should be kept together, in hopes of establishing a suit, and of remaining with the long trump, with which to get the lead after the other trumps are out, and so to bring it in. Thus, if the opponents lead a losing or doubtful card, it is better, as a rule, not to trump it when holding four trumps. But if the opponents lead a winning card, it is, as a rule, better to trump it, though holding four trumps, than to pass it in hopes of bringing in a suit.

With five trumps, the chance of succeeding in exhausting the opponents' hands, and of remaining with the long trump, is so considerable, that a player having five or more trumps, should lead them ; and as number is the principal element of strength, he should not be deterred from leading trumps merely because the fourth hand has turned up an honour.

With four trumps only, it is better first to lead the strong suit. When the adversaries' hands are cleared of that suit, or so far cleared that the holder of the long cards in that suit commands it, it is, as a rule, safe to lead from four trumps.

As a rule, less than four trumps should not be led from. But a player is justified in leading from weak trumps, if he holds winning cards in every suit ; if the adversaries are both trumping a suit ; or if the game is lost, unless partner has strength.

It is most important to return partner's trump lead at once, unless he has led from weakness ; for partner, by leading trumps, declares a strong game, and it is then the best policy to abandon one's own plans, and to support his.

It follows that a player should not, as a rule, lead a card for his partner to trump, unless he has four or more trumps ; for with less than four trumps, the player is weak ; and if he forces his partner to trump, partner is weakened also ; and the chances are that by weakening partner under such circumstances, the command of trumps will remain with the adversaries.

But a player may force his partner, although weak himself, if partner has already been forced, and has not afterwards led trumps ; if partner has already declared weakness in trumps, as by trumping a doubtful card second hand ; if two partners can each trump a different suit ; and when one trick from partner's hand wins or saves the game.

The same considerations which make it inexpedient to force partner when weak one's-self, shew the

WHIST.

advantage of forcing a strong trump-hand of the opponents.

There are yet some general rules of play which have not been explained.

The second, third, and fourth players should always play the lowest of a sequence. The rule here given is in conformity with the play that would naturally be adopted in playing cards that are not in sequence; and by keeping to a uniform plan, players are enabled to infer what cards their partner does or does not hold. It is true that the adversaries often gain the same information; but it is found by experience that it is of more advantage to inform partner than to deceive the opponents.

As a rule, it is advisable to lead out the winning cards of partner's suit. The presumption is that he has led from his strong suit; and by leading out the winning cards, the suit is cleared for him, and his long cards are not obstructed. The reverse applies to suits led by the adversaries. It is mostly right to retain the winning cards of such suits as long as possible, in order to stop the establishment of them.

When a player has none of the suit led, he should, as a rule, throw away from his weakest suit; for by discarding from a strong suit, its numerical power is damaged. But when the adversaries have shewn great strength in trumps, it is not advisable to keep small cards of a long suit, as it is not likely that it can ever be brought in. Under such circumstances, the player should throw away from his best protected suit, and keep guards to his weaker ones.

Players should watch the cards as they are played, and endeavour to infer from them where the others lie. Thus, if a player wins a queen with an ace, it may be inferred that he has not the king, the rule being to win with the lowest; if a player leads trumps at starting, it may be inferred, as a rule, that he is strong in trumps, or has a very fine hand. By recording in this way, and by counting the number of cards played in each suit, skilled players will often, towards the close of a hand, know the position of all the important cards remaining in; and by means of this knowledge, they will be able to play the end of the hand to the same advantage as though they had seen all the cards.

And lastly, and most important of all, players should play to the score. Thus, wanting but one trick to save or win the game, a winning card should be played at once. The example is stated as for one trick; but it should always be kept in mind how many tricks are requisite to win or save the game, or even a point, and the play should be varied accordingly.

The previous condensed outline embodies the principal rules of play. For more detailed information, the reader is referred to Professor P.'s Essay on the modern scientific game (Longman, Green, &c.); Cavendish's Principles of Whist (De la Rue & Co.); and 'J. C.'s' Treatise on the game (Harrison). They should be read in the order here indicated.

ILLUSTRATIVE HAND.

The following example (the figures for which were kindly lent by the proprietors of *The Field*, in whose columns are given many excellent illustrative hands) is given to shew how the play at whist is conducted in accordance with the preceding general rules, and also how inferences from the fall of the cards may be drawn and used. The example is of the simplest kind, and is not intended to exhibit any fine stroke of play. A, B, C, and D are the four players; they sit round the table in the order of the letters, A C being partners against B D. A is the first leader, and D the dealer. We will suppose ourselves to be A, the score to be level, and D to have turned up the four of hearts.

A's HAND.

| | |
|-----------------------|---|
| Ace, 2 of | ♠ |
| Queen, 8, 7, 5 of | ♥ |
| 9, 6, 5 of | ♣ |
| Queen, Knave, 7, 2 of | ♦ |

[Note.—It is a great assistance to inexperienced players to sort the hand from a pack, and play a card to each trick, as would be done in actual practice.]

THE PLAY.

[Note.—The cards in each trick are placed in the order in which they are played, the leader's card standing first. The capital letter in front of each card shews by whom it was played.]

Remark.—A leads from his strongest suit. He leads the lowest card of it. (For reasons, see preceding article.)

Inference.—C being unable to win the king, A should note that the best diamond is against him, probably in B's hand, as the rule is with ace and king to put on king second hand. (See preceding article.) Some players put on king second hand, with king and one small one; but, as a rule, the smallest should be played, unless the second hand holds a sequence. C dropping the nine, and A holding queen and knave (refer to A's hand), A concludes C to have ten or no more, the rule being to play the smallest when unable to head the trick.

It is in this way, by comparing the cards that fall with those that remain in hand, that players obtain an insight into the game to guide them in their future conduct of the hand.

Inference.—A infers clubs to be B's strongest suit. This inference does not affect the subsequent play. But it might; and, at all events, it is an inference that A ought to draw.

Remark.—D returns his partner's lead (for reasons, see preceding article).

Several inferences might here be drawn as to the position of the remaining clubs—as, for instance, that C has the queen; but as they do not affect the play, they are omitted, for the sake of brevity.

Remark.—B continues his suit (for reasons, see preceding article).

Inferences.—Spades may be taken to be C's strongest suit.

D, putting on queen second hand, probably has king (see preceding article). Also, he may be presumed not to have the knave, or he would play the lowest of the sequence.

Remark.—A continues his suit. As a rule, with second and third best (in this case, queen and knave), one of those should be led; but C having played the nine to the king, in the first trick (refer to Trick 1, and last inference therefrom), A would part with strength unnecessarily by leading a high card, as C either has the ten or will trump.

This is an example of direct departure from common rule, owing to previous fall of cards.

Remark.—C continues his suit.

Inference.—The ten falling from B's hand, it may be inferred that he holds knave or no more.

Inferences.—B not playing the knave of spades, C may be inferred to hold it (see inference, previous trick, and last inference, Trick 5).

As regards the lead of the spade here, it may seem at the first glance to be contrary to the rules of play advocated in the preceding article. It is a return of the adversary's lead, and up to the strong hand. But it must be remembered that whist is not a stereotyped game of rule; rules can only be given for the general case, and they have to be departed from more or less frequently as the circumstances of the hand become developed. In the case before us, any other lead would probably be worse. We may take it for granted that D is not very strong in trumps, or he would have led them. The diamond lead would enable the adversary to make the winning diamond, and then probably a small trump on the next round. The spade lead would probably enable B either to make the knave of spades or a small trump (see inference, Trick 7).

It may be asked: Why, if D is not strong in trumps, does he lead a card which may force his partner? This question may be satisfactorily answered by referring to the score (see preceding article). B D have four tricks up, and one more saves the game if either B or D holds an honour. D is justified at this point of the game in forcing his partner, even though weak in trumps. Or D may have four trumps, and so be strong enough to force at any score, but not strong enough to lead trumps (see management of trumps in preceding article).

Remark.—A trumps, as the knave may be with B. He chooses the seven rather than the five, in order to prevent B from making so small a card as the six by overtrumping.

Remark.—B leads the thirteenth club.

Inferences.—It is probable, from this lead, that B

has strength in trumps, such as an honour guarded. When a thirteenth card is led before trumps have been played, it generally means that the leader has such strength as above presumed, and that he wants his partner to put on his best trump, in order to make the trumps separately. It may be, however, that the leader only wants his partner to be led up to if the thirteenth card is trumped by the fourth hand. It is a difficult point in the game for the third hand to know whether to trump a thirteenth card high or to pass it.

A further inference from this trick is, that D is probably weak in trumps, as he only puts on the six. If he trumps at all, he will most likely trump with his highest. Looking at the fact that if the trump lead comes from A, the lead will be presumably up to a weak suit, and also that A has the best diamond and his partner the best spade (see inferences, Tricks 5 and 8), A determines to lead a trump. Accordingly,

Remark.—Having but two of the suit, A leads the best (see preceding article).

Remark.—C returns his partner's lead of trumps. As a rule, partner's trump lead should be returned immediately (see preceding article); but it does not follow that C is bound to return trumps here, a strengthening trump being led late in the hand. C, however, does well to return the trump in this case, as, on the whole, perhaps the best chance for the odd trick is to bring the trumps down this round, and to find A with the winning diamonds.

Trick 12.—B leads a diamond (he has only diamonds in hand), and A makes the knave and queen. A C score the odd trick.

WHISTON, WILLIAM, was born on 9th December 1667, at Norton, in Leicestershire, of which place his father was rector. His earlier education he received at home; subsequently, he became the pupil of a Mr Antrobus at Tamworth, and finally he went to Cambridge, where he greatly distinguished himself, chiefly as a student of mathematics. In 1690, he took his degree, and obtained a Fellowship in 1692. The year after, he became chaplain to Dr More, Bishop of Norwich; and in 1698, having been presented to the living of Lowestoft, in Suffolk, he was married to Miss Antrobus, the daughter of his old preceptor, his Fellowship being thus forfeited. Meantime, in 1696, had appeared his *Theory of the Earth*, a work which, despite, or perhaps in virtue of, the oddity of certain of its speculations, procured him a considerable reputation. That his genuine claims as a man of science were considerable, is made clear by the fact, that in 1703, by the express influence of Sir Isaac Newton, whose acquaintance he had made some years previously, he was appointed to succeed him in the Lucasian Professorship at Cambridge. On receiving this appointment, he gave up his living, and again settled himself at the university. In addition to the duties of his chair, he engaged in clerical work; and such was his success as a preacher, that he would probably have attained high position in the church, had not the development of his theological opinions led him into Arian heresy—his

frank and fearless avowal of which at once in his preaching and his writings led, in 1710, to his expulsion from his professorship and the university. In the same year appeared the most noted of his original writings, *An Historical Preface to Primitive Christianity Revived*. His subsequent prosecution in the church courts forms a curiously complicated chapter in the history of such matters. The result was, that after five years of vexatious suspense, during which the proceedings wayed hither and thither in the strangest way, they proved in the end abortive, and W. was permitted to remain formally a member of the Church of England. By many of the clergy, however, much dissatisfaction was expressed; the famous Dr Sacheverel in particular thundered from the pulpit against the delinquent, and refused to admit him to communion—an example which was followed by others. It seems significant of the social stigma attached to him in the minds of the orthodox, that when Halley, in 1720, proposed him as a member of the Royal Society, his old friend Newton successfully opposed his admission. W. himself, the most amusingly vain of men, remained indeed deeply convinced that Newton's conduct was dictated by jealousy of his superior scientific genius—a notion in which he probably found not many to agree with him. Having no ostensible means of livelihood, W. was frequently reduced to great straits; but he had kind friends, who were ready to assist him at need. In the dissemination of his religious opinions he continued unwearied; his publications on the subject were numerous; also, he occasionally delivered lectures; and he instituted a religious society, which had meetings at his own house. He also busied himself much with scientific crotchets, chief among which was a scheme for calculating the longitude, of the success of which he was assured. He died on the 22d of August 1752, at the great age of 85. Of all his numerous works, a translation of Josephus was the only one which continued for a time to perpetuate the name of its author; and of this there have been several reprints. His *Memoir of his own Life* (published in his lifetime in 3 vols. 1749—1750) is a curious specimen of self-portraiture, and conveys a very vivid image of this strange, whimsical, eccentric, but thoroughly honest and conscientious man.

WHITBY, a parliamentary borough, market-town, and thriving seaport in the North Riding of Yorkshire, on both sides of the mouth of the Esk, about 50 miles north-north-east of the city of York by railway, and 42 in a straight line. A stone bridge with a swivel, by which vessels are admitted into the inner harbour, connects the two parts of the town. Two piers, of which the west one is about 1000 feet long, run out into the German Ocean, and protect the outer harbour, and it is further protected by two inner piers, which break the force of the waves during storms. On a cliff about 350 feet high stands the parish church, which is approached from the town below by a flight of nearly 200 steps. There are dry docks for the building and repair of ships; iron and jet ornaments are extensively manufactured—the jet found in the vicinity having a world-celebrity. Alum and ironstone—the latter found in great quantities in the neighbourhood—are exported. Of late years, W. has risen into importance as a watering-place. In 1865, 738 vessels, of 37,787 tons, entered and cleared the port. Pop. (1861) 12,051.

The Saxon name of the place was Streoneshalch, but when the Danes took possession of it they called it Whitby (white town), just as they changed the Saxon Northweorthing into Deoraby or Derby. The termination *by*, which is characteristic of Danish settlements, is a corruption of the old Norse *byr*,

modern Icelandic *boer*, a dwelling, farmstead, town. In Devon the suffix occurs in the form *bere* or *beer*, as in Rockbere, Larkbeer.

WHITCHURCH, a small market-town of Shropshire, on a height, 20 miles north-north-east of Shrewsbury by railway. Trade in malt, hops, and shoes is carried on. Pop. (1861) 3704.

WHITE, HENRY KIRKE, was born on the 21st March 1785, at Nottingham, in which place his father was a butcher. It was at first intended that he should be bred to his father's business; but at the instance of his mother, a woman of superior intelligence, this plan was departed from, and he was apprenticed to an attorney. At his business he displayed exemplary diligence; whilst his leisure-hours were passionately devoted to intellectual pursuits, and especially to the cultivation of poetry, which he had very early begun to practise. He also became a member of a literary society in Nottingham, and began to attract notice by his fluency and ability as a speaker. To the *Monthly Mirror* he was wont to send contributions, and the merit of his verses drew to him the attention of Mr Hill, its proprietor. Acting on the advice of this gentleman, and Mr Capel Loft, who also took a generous interest in him, he published in 1804 a small volume of poems, which was cruelly treated by the critics, and found little acceptance with the public. It was the means, however, of securing him influential friends, notably Southey, who was shortly to become his biographer, and the Rev. Mr Simeon, through whose influence a sizarship in St John's College, Cambridge, was procured for him. In his studies he highly distinguished himself; but the ardour with which they were pursued speedily proved the ruin of a constitution at all times delicate; consumption rapidly developed itself, and he died October 19, 1806. The year after, two volumes of his *Remains* were published by his friend Southey, to whom his MSS. had been intrusted, prefaced by a pleasing Memoir of the deceased poet. Southey's name commanded attention; and the touching story of youth cut down in the flush of its early promise, moved the pity of the world, and gave for a time to the poetry of W. a popularity somewhat greater than its merit would strictly, perhaps, have warranted.

He came with all his youth and unblown hopes
On the world's heart, and touched it into tears.

These tears are some time since dry; and the poetry is now a good deal forgotten. It is destitute of force and originality; but in virtue of its grace, elegance, just and pious sentiments, it may still have some claim to live as produced by a man so young aspiring to be a poet under difficulties.

WHITE, REV. JOSEPH BLANCO, was born at Seville, in Spain, on 11th July 1775. His father was a merchant there of Irish parentage, who had married a Spanish lady of old Andalusian family. Finding his father's counting-house on trial not at all to his mind, he quitted it to prepare himself for holy orders, and in 1799 he was ordained a priest. But born with a mind curiously restless and inquisitive, he ceased in no long time to find himself at home in the Romish communion; and in 1810 he came to England, which he never afterwards quitted. Joining himself to the English Church, he seems to have meditated becoming one of its clergymen; an intention which it was quite as well he did not carry out, inasmuch as his speculations rapidly led him to results not recognised by English orthodoxy. On coming to England, he settled himself in London, where for some years he conducted a monthly Spanish paper called *El Español*. On the cessation of the Peninsular War in 1814, this publication

ceased also, as having no longer a *raison d'être*; but meantime its services to the government of the day had been such as to secure for its editor a pension for life of £250 per annum. Subsequently, Mr W. lived chiefly in London, employed as a man of letters. Though in literary circles recognised as a man of fine talent, and known as a contributor to the *Quarterly* and *Westminster Reviews*, and other high-class periodicals, he scarcely succeeded in making a permanent impression on the public by any of his more formal publications. Of these, the most important were: *Letters from Spain* (1822), contributed some years before to the *New Monthly Magazine*; *Practical and Internal Evidence against Catholicism* (1825); *Poor Man's Preservation against Popery* (1825); and *Second Travels of an Irish Gentleman in Search of a Religion* (2 vols. 1833). He died on the 20th May 1841, in Liverpool, whither he had removed some years before. In 1845 there was given to the world, as his legacy to it, by much his most striking and valuable work, *The Life of the Rev. Joseph Blanco White, written by himself; with portions of his Correspondence*; edited by John Hamilton Thom (London, 3 vols. 8vo). This book, at the time of its appearance, excited a good deal of interest, and is still eminently worth referring to. The curious picture it presents of a mind at once pious and sceptical, longing and sorrowing after a truth which it can nowhere find, or finding, contrive to rest in, has, in the present unsettled state of religious opinion, a very particular significance. Poor W.'s life-long 'search for a religion' seems not to have been a successful one, and to have landed him at the last in a condition of nearly entire scepticism.

WHITEBAIT (*Rogenia alba*), a small fish of the Herring family (*Clupeidae*), of a genus distinguished by having teeth on the palate and pterygoid bones, on the vomer, and on the tongue. The W. is found on many parts of the British coast, and is particularly abundant in the estuary of the Thames in

Whitebait (*Rogenia alba*).

spring and summer. It ascends estuaries in spring in shoals to deposit its spawn. Adult W. are caught on the coasts of Kent and Essex during winter. The small fry begin to appear in the end of March or beginning of April. The W. is not uncommon in the Firth of Forth. This fish attains a length of six inches, although the W. caught in the estuaries of the Thames and other rivers, and much prized as a luxury, are mostly young fish, not exceeding three or four inches in length. They are caught by means of bag nets sunk four or five feet below the surface of the water. For several months, they continue to ascend the river in shoals with the flood-tide, and descend with the ebb-tide, not being able to live in fresh water. They are fried with flour or crumbs; they are often laid on a napkin and sprinkled with fine flour and a little salt, rolled about till well covered with flour, and then thrown into a pot of boiling lard, where they remain till they are of a

pale straw colour. Londoners resort to Greenwich and Blackwall to enjoy W. dinners. It has become the practice for her Majesty's ministers to repair to Greenwich for a W. dinner every year before the prorogation of parliament in autumn. Some of the corporations of London indulge in a similar annual festivity. The young of herring, pilchards, and sprats are often served up as W., although the true W. is of more delicious flavour. It was formerly supposed that the W. was the young of the shad or sprat, although it is now regarded as not only specifically but generically distinct. The W. has the body more compressed than the herring; the belly is serrated; the lower jaw is longer than the upper; the scales are very soft, small, and thin, and very easily rubbed off; the colour is silvery white, greenish on the back. The food of the W. seems to consist of minute crustaceans.

WHITEBOY, the name of an illegal association of the peasantry in Ireland, which for a long series of years was the fruitful source of agrarian outrage, sometimes of a very revolting and sanguinary character. The association had its origin in the early years of the reign of George III.; and first took an organised form in the county of Tipperary, where it appeared in the shape of a united resistance to an attempt on the part of certain proprietors to enclose and appropriate lands up to that time common. The movement at the beginning was confined to throwing down the newly erected fences, and destroying the enclosure, from which circumstance the rioters were in the first instance called 'Levellers;' but their views soon extended further, and they addressed themselves to the redress, first, of the oppressive exactions of tithes, and afterwards of various other grievances, especially those connected with the tenure of land. The name of Whiteboys was given to them in consequence of their wearing white shirts in their nightly expeditions. Many acts of cruelty and outrage having been committed, a special commission was issued in 1762 for the trial of the offenders; but the repression was only partial and temporary, and Whiteboyism reappeared more than once in the southern province. In 1787, a new association, the members of which called themselves 'Right-boys,' appeared in the same district, and was made the subject of discussion in the Irish parliament. The conflicts of the northern Orangemen (q. v.) and Ribbonmen (q. v.) for a time drew attention away from the minor discontents of the south; but the same spirit of secret combination has continued among the peasantry down to the present day. The Shanavests, Caravats, Rockites, Terry Alts, and other more obscure or more local denominations, must be regarded as embodiments of the very same discontent, which has long held its ground among the poorer classes in Ireland, and which, although undoubtedly exaggerated and embittered by the recollections of hereditary wrong inseparable from the condition of a conquered people, are held, even by politicians of moderate views, to have much justification in the social condition of the people, and in certain striking anomalies of the legislature in reference to Ireland, and especially the endowment and establishment of the church of a small minority of the population, as compared with the other portions of the British dominions.

WHITE COLOURS. The principal white pigments used by painters are: (1) *White Lead* (see LEAD), which is not only used as a colour, but forms the body of most oil-paints; (2) *Derbyshire White*, which is sulphate of baryta; (3) *Pearl White*, or tri-nitrate of bismuth; and (4) *Zinc White*, or hydrated oxide of zinc.

WHITEFIELD, GEORGE, one of the founders of Methodism, was born in the Bull Inn, at Gloucester, on the 16th December 1714. He was educated at the grammar-school of his native town, at which he appears to have distinguished himself, especially by elocutionary displays at the annual visitations. On leaving school, he was for a time engaged assisting in the business of his mother, the hostess of the Bull Inn; but he obtained admission as a servitor at Pembroke College, Oxford, when in his 18th year. About three years earlier, John and Charles Wesley had laid, in the university of Oxford, the foundations of Methodism—a system which, at first, resembled the rule of a religious order more than the bond of a religious sect; requiring from its professors ascetic observances and devotion to works of piety and charity. It was not till he had been upwards of a year at the university that W. became associated with the Methodists. He at once made himself remarkable among them for zeal, for the austerity of his asceticism, for labour too great for his strength among the sick and the prisoners in the jail. His health gave way, and he had to go home, when his native air soon restored him; after which he carried on at Gloucester the same pious and self-denying practices which he had begun at the university. His conduct drew upon him the attention of the bishop of the diocese, who offered, though W. was only twenty-one, to admit him immediately into orders. The offer was accepted, and W. was ordained a deacon in 1736, before he had taken his degree. He preached his first sermon in Gloucester Cathedral, and the effect of it was remarkable. The vehemence and earnestness of his oratory deeply moved the audience; and five persons are said to have been driven mad with fear and excitement. Complaints were made to the bishop; but this good man gave no heed to them—simply saying that he hoped the madness would last to the following Sunday. During the next two years, W. preached with similar results in various churches in England.

Meanwhile, Wesley had been in America establishing missions among the colonists; and in 1738 he desired W. to join him, a request that was immediately complied with. W. had to go to London to make arrangements for his journey; and this visit, though not his first, seems first to have made him known to the inhabitants of the metropolis, upon all classes of whom—fine gentlemen like Chesterfield, and cool sceptics like Bolingbroke, as well as the more mobile crowd—he afterwards made an impression such as, probably, no other preacher ever produced. His success in London was immediate, and much exceeded all that had befallen him previously. The doors of the church in which he was to preach were besieged before the dawn; the unlighted streets in the early morning were filled with persons carrying lanterns, making their way to the place of worship many hours before the time of service. This lasted until his departure for America. He was hereafter to be almost as closely connected with evangelical labours in America as in England itself; but on this first occasion, his stay was short—only a few months. He returned to be admitted to priest's orders, and to collect funds for the establishment of an orphanage in Georgia. He soon went back to America, but not before a beginning had been made of his split with the English Church, whose clergy he offended by preaching in the open air, whether he got permission from the parish clergyman or not, and by deviating, whenever he thought fit, from the liturgy of the church. But the remarkable and beneficial effects of his preaching on the rude miners and others who

flocked to hear him, consoled him for clerical censures; and after this, he seems to have preached almost by preference in the open air. His second visit to America occupied nearly two years. He came back in 1741.

It was about this time that doctrinal differences led to his separation from John Wesley—both of them being by this time disowned by the Established Church. Wesley believed and preached the doctrine of universal redemption; W. was a rigid Calvinist. Each thought his belief of the utmost importance, and in the end, each excommunicated the other. W.'s supporters now built him a large shed at Moorfields, near Wesley's chapel—which, being temporary, was known as the Tabernacle; and his preaching gathered immense audiences around him. But he had no talent for organisation; and as soon as he went away on his frequent and protracted journeys, his supporters began to disperse. But that the Countess of Huntingdon, a lady of wealth and of abilities, became a convert to his views, W., in all probability, would not have founded a sect. But this lady appointed him her chaplain; she built and endowed chapels to maintain his Calvinistic doctrines; and thus a slight memorial of W.'s preaching, though it more directly commemorated the zeal and energy of Lady Huntingdon, remains in what is known as the Huntingdon connection.

One of his most famous missionary journeys was that which he made to Scotland in 1741. He went to Scotland on the invitation of Ralph and Ebenezer Erskine, well known as leaders of a secession from the Church of Scotland; but his notions were too catholic for his friends; he was as ready to preach in a parish church as to a seceding congregation, and more ready still to preach in the open air; and the Erskines soon differed from and separated from him. That the impression he made upon the people of Scotland was very strong and very general, may be inferred from the fact that the leading corporations of Scotland—Edinburgh, Glasgow, Aberdeen, Stirling—admitted him to their citizenship. At Cambuslang, in Lanarkshire—a mining district, mainly inhabited by rude colliers, then *adscripti glebae*—his preaching produced one of the most remarkable 'revivals' of modern times; many thousands were stricken with concern about their souls, and violent physical manifestations followed upon their excitement—foaming at the mouth, bleeding at the nose, convulsions—which, by many who read of them, were attributed to Divine influence, by others to the devil. It was on his return from this visit to Scotland, that W., making a stay in Wales, met and married a widow, a Mrs James. His marriage, like that of Wesley, was not a happy one; and it is recorded that the death of his wife, when it occurred, 'set his mind much at liberty.'

To America, W. paid seven visits, several of which lasted for two or three years. He set out for America for the last time in 1769. He was ailing at the beginning of the voyage; he was ill at the end of it; and he died somewhat suddenly not long after his arrival in America, at Newberry, near Boston, on the 30th September 1770. A collection of his sermons, letters, and controversial writings was published in the following year (*The Works of the Rev. George Whitefield*, 6 vols. London, 1771); and in 1772 were published his memoirs, by Dr Gillies. His writings do not sustain the impression which would be derived from the accounts of his preaching. They shew him as a man of somewhat slender talent and common-place quality of mind; quite unlearned; entirely free from the casuistical turn, as well as deficient in the worldly

knowledge and prudence, for which Wesley, like many other enthusiasts, was pre-eminent. His success as a preacher seems to have been in no small degree due to a sonorous but expressive voice; no doubt it was mainly due to the earnestness of his faith, to the fluency and rude strength of his homely language, and to that vehemence and impetuosity of nature which, perhaps, is the thing most distinctive of the orator. Of the *Memoirs of the Life and Character of George Whitefield*, by J. Gillies, D.D., of the College Church, Glasgow, originally published at London in 1772, subsequent editions, containing additional matter, appeared in 1798, in 1811, 1812, 1813, and in 1827. An anonymous *Life of George Whitefield*, founded upon his journals and letters, and borrowing largely from the work of Dr Gillies, appeared at Edinburgh in 1828. *Whitefield's Life and Times*, by Robert Philip, D.D., was published at London in 1837; and there has since appeared a full memoir, under the title *George Whitefield: a Light rising in Obscurity*, by Andrews (Lond. 1864).

WHITEFISH (*Coregonus albus*, see COREGONUS), a fish of the family *Salmonidae*, of the same genus with the Gwyniad, Vendace, Powan, Pollan, &c. It is found in the lakes and large rivers of North America, from the St Lawrence and its tributaries to the Arctic regions, and is one of the most valuable of American fresh-water fishes, abounding over a great extent of country, and being excellent for the table. It is the *Attihawmeg* of the north-western Indians. The body is elongated but thick, the head small and the muzzle pointed, the tail forked, the scales large. The mouth is destitute of teeth. It sometimes attains a length of two feet and a half, and weighs ten pounds. It is bluish-gray on the back, lighter on the sides, and white below. It spawns in October, proceeding from the lakes up the rivers for this purpose. It usually swims in shoals, like its small British congeners. It feeds chiefly on insects and entomostraca. It is caught by nets, which are often spread under the ice, and the fishery is attended with much labour and exposure. The Indians sometimes spear it through holes in the ice. The W. forms the principal food of many Indian tribes, and of the fur-traders, during great part of the year. It is often salted by them. The flesh is bluish-white, changing to a pure white when boiled, whence the name. The most southern lake in which the W. is found is Lake Champlain. No fresh-water fish better deserves to be made the subject of piscicultural experiments than the W., and its acclimatisation in Britain would probably be as easy as it is desirable. —An allied species, the OTSEGO W. (*C. Otsego*), found in Lake Otsego, is also of exquisite flavour; but it is now rare.

WHITE FLUX. See FLUX.

WHITE GUNPOWDER is a mixture that was at one time employed in blasting, but is now scarcely ever employed in consequence of the danger attending its preparation, and the facility with which it explodes by friction. Its ingredients are chlorate of potash, dried ferrocyanide of potassium, and sugar.

WHITEHALL, a village of New York, U.S., at the head or southern extremity of Lake Champlain, and termination of the Troy and Champlain Canal, with important railway and steamboat connections, and water-power for saw and flouring mills, machine woollen and carpet factories. It was settled by Major Philip Skene in 1761, and called Skeneborough; in the war of 1812 it was an important military depot. Pop. in 1860, 4860.

WHITEHAVEN, a parliamentary borough and seaport of Cumberland, near the point where the estuary of the Solway Firth joins the Irish Sea, 40 miles south-west of Carlisle by railway, 36 in a straight line, and 34 miles east-north-east of Ayre Point, the northern promontory of the Isle of Man. It contains a market-house, custom-house, baths, and a theatre, as well as the West Cumberland Infirmary. The harbour is commodious, but is now dry at low water. The sources of the prosperity of the town are its vicinity to extensive collieries—some of which extend beneath the town and stretch out under the sea—and the extraordinary abundance and richness of the hematite iron ore found in the neighbourhood. Coal and iron mines are numerous; there are iron smelting-works, and iron and brass foundries—the manufactured iron being shipped mostly to the Welsh and Irish markets. There are dry docks for the building and repair of vessels; and rope-making and the manufacture of thread and sailcloth are important branches of trade. W. returns one member to the House of Commons. In 1866, 5348 vessels, of 443,971 tons, entered and cleared the port. Pop. (1861) 18,842.

WHITE LADY, a being who, according to popular legend, appears in many of the castles of German princes and nobles, by night as well as by day, when any important event, whether joyful or sad, but particularly when the death of any member of the family is imminent. She is regarded as the ancestress of the race, shows herself always in snow-white garments, carries a bunch of keys at her side, and sometimes rocks and watches over the children at night when their nurses sleep. The earliest instance of this apparition spoken of was in the 16th c., and is famous under the name of Bertha of Rosenberg (in Bohemia). The W. L. of other princely castles was identified with Bertha, and the identity was accounted for by the intermarriages of other princely houses with members of the house of Rosenberg, in whose train the W. L. passed into their castles. In the castle of Berlin she is said to have been seen in 1628, and again in 1840 and 1850. The most celebrated in Britain is the W. L. of Avenel, the creation of Sir Walter Scott. It was long a common belief in the Highlands that many of the chiefs had some kind spirit to watch over the fortunes of their house. Popular tradition has many well-known legends about white ladies, who generally dwell in forts and mountains as enchanted maidens waiting for deliverance. They delight to appear in warm sunshine to poor shepherds or herd-boys. They are either combing their long hair, or washing themselves, drying wheat, beating flax, or spinning; they also point out treasures and beg for deliverance, offering as reward flowers, corn, or chaff, which gifts turn in the instant into silver and gold. They wear snow-white, or half white half black garments, yellow or green shoes, and a bunch of keys at their side. All these and many other traits that appear in individual legends may be traced back to a goddess of German mythology who influences birth and death, and presides over the ordering of the household. Still more distinctly the appellation W. L. and the name Bertha point back to the great goddess of nature, who appears under various names, and who, as *Berhta* (i.e. the brilliant, shining, white), held her circuit on Twelfth-night and revealed her power. When the legend goes on to say that the Bohemian Bertha of the 15th c. promised the workmen of Neuhaus a sweet soup on the completion of building the castle, and that this soup, along with carp, is still given in remembrance of it to the poor on Maundy Thursday, we recognise again the festival dishes consecrated to Berhta, such as fish, oatmeal

gruel or dumplings, &c., which it is still customary to eat about the time of Twelfth-night and Christmas in most districts of Germany.

WHITE LEAD. See LEAD.

WHITE MOUNTAINS, a mountain-chain of New England, U.S., regarded as an outlier of the Appalachian range, commences at the headwaters of the Aroostook River, in Maine, where its first summit is Mount Katahdin, and extends in a broad plateau, from 1600 to 1800 feet high, west by south nearly across New Hampshire, where it has twenty bold peaks, with deep, narrow gorges, wild valleys, beautiful lakes, lofty cascades and torrents, forming the 'Switzerland of America,' and a favourite resort of summer tourists. Mount Washington, the highest summit in New England, 6285 feet, has a practicable carriage-road and a hotel on its summit; Mount Pleasant, the second of the group, is 4712 feet; the lesser are named Franklin, Monroe, Jefferson, Adams, Madison. In the Franconia group are Lafayette, 5500 feet, and Moosehillock, 4636. These mountains furnish the chief sources of the Connecticut, Merrimack, and Androscoggin rivers. The rocks are ancient metamorphic, with naked granite and gneiss. The Ammonoosuck River falls 5000 feet in 30 miles, the Androscoggin 200 in a mile. Five narrow and precipitous notches seem to have been rent in the mountains, and give passage to as many rivers.

WHITE PRECIPITATE. See MERCURY.

WHITE RIVER, a river of Arkansas and Missouri, U.S., rises in the Ozark Mountains, flows north-east into Missouri, then turning east and south-east into Arkansas, drains the north-eastern portion of the State, and flowing southerly, empties itself into the Mississippi near the mouth of the Arkansas. It is 800 miles long, and navigable 350 miles.

WHITE SEA (Russ. *Bjeloje-More*), an arm or great bay or inlet of the Arctic Ocean, which, between Cape Kanin on the Kaninskaia Peninsula, and Cape Sviatoi on the Kola Peninsula, penetrates the Russian government of Archangel southwards to lat. 64° N. At its entrance between Capes Kanin and Sviatoi it is 100 miles broad; after penetrating the land 150 miles in a south-easterly direction, it narrows to a width of 35 miles; but after sweeping south for 200 miles, it again considerably widens, forming in the north-west the Gulf of Kandalak, and in the south and south-east the great Gulfs of Onega and Archangel or Dwina. The W. S. covers an area estimated at 47,000 sq. m., and the length of its coast-line is over 1000 miles. The coasts in the north and east are mountainous, in other places they are mostly low, and abound in lakes, which communicate with the sea by rivers. The greatest depth of the W. S. is 1133 feet. From the middle of August ice forms on the coasts sometimes to the width of 30 miles, and is not melted till the following July.

WHITE SULPHUR SPRINGS, a village and watering-place in Virginia, U.S., on Howard's Creek, 205 miles west of Richmond. It has hotel accommodation for 1500 guests. The spring is in the lowest part of a beautiful valley, and is covered by a dome supported by 12 Ionic columns, and surmounted by a statue of Hygeia: it is 2000 feet above tide-water; yields 30 gallons per minute of water at 62° Fahr., impregnated with sulphates of lime, soda, magnesia, carbonate of lime, chlorides of calcium and sodium, iron, iodine, sulphur, carbonic acid, sulphuretted hydrogen, oxygen, nitrogen. It is considered efficacious in dyspepsia, liver diseases, gout, rheumatism, and diseases of the skin and

180

kidneys. The Red, Salt, and Blue Sulphur Springs, at a distance of 22 to 24 miles from the above, are also much resorted to.

WHITE SWELLING. See JOINTS, DISEASES OF.

WHITETHROAT (*Curruca cinerea*), a bird of the family *Sylviadae*, a summer visitant of Britain; plentiful during summer in the greater part of England and in Ireland, but comparatively rare in Scotland. It is also common during summer in the south and middle of Europe, and is found even in the north. It places its nest in a low bush, or among a tangled mass of brambles and weeds. Its food consists both of insects and berries. Its song is not

Whitethroat (*Curruca cinerea*).

very sweet, but is delivered with great energy, and it seems to vie with other birds in singing, refusing to be outdone. It is very lively and amusing as a cage-bird, and very easily tamed. The whole length of the W. is 5½ inches. Its plumage is brown, of various shades; the breast and belly brownish-white, tinged with rose-colour in the male.—The Lesser W. (*Curruca sylvicola*) is a species of much rarer occurrence in Britain. The Whitethroats belong to the same genus with the Blackcap (q. v.) and the Garden Warbler (*C. hortensis*), which is not uncommon in Britain, and almost rivals the Blackcap in the richness of its notes.

WHITE VITRIOL. See ZINC.

WHITE-WASH, slaked quicklime, reduced to the consistency of milk by means of water. It is used for colouring walls, and as a disinfectant. If merely for colouring, a little size is added, but not when used for sanitary purposes.

WHITE-WOOD BARK. See CANELLA.

WHITGIFT, JOHN, the third Protestant Archbishop of Canterbury, was born at Great Grimsby, in Lincolnshire, according to one account in 1530, according to another in 1533. His father was a merchant, and is said to have belonged to a family long established in Yorkshire. His early years were passed within the Abbey of Wellow, near Grimsby, of which his uncle was the abbot; and from that he went to St Antony's School in London, a religious house then in great reputation. About 1548, he was entered at Queen's College, Cambridge. After a short time, he removed to Pembroke Hall, of which he continued a member till 1555, when he was elected a Fellow of Peterhouse. He took orders in 1560, and as he shewed a remarkable talent for preaching, the Bishop of Ely appointed him his chaplain, and gave him the living of Feversham. In 1563, he was appointed Lady Margaret's Professor of Divinity. In 1567, he became Master of Pembroke Hall; and in the course of the same year, Queen Elizabeth, who admired his preaching, and had made him one of her chaplains, appointed him to the Mastership of Trinity College. About

WHITING—WHITLOW.

this time, he also obtained the Regius Professorship of Divinity, and took his Doctor's degree. He was appointed Dean of Lincoln in 1571, Bishop of Worcester in 1577, and Archbishop of Canterbury in 1583. He at one time held together—under a dispensation from the archbishop—the Deanery of Lincoln, the Mastership of Trinity, the Regius Professorship of Divinity, and the living of Feverham; and the dispensation enabled him to hold, along with these, any other benefice whatever. This cannot have been often paralleled, even in the history of pluralities. Of course, the man so favoured had rendered and was rendering considerable services to the church and to the crown.

His first work, on becoming Master of Trinity, was upon a revival of the statutes of the university. He obtained such powers for the heads of houses as enabled them to eject from the Lady Margaret's Professorship the able and energetic Puritan, Cartwright, on the score of his Calvinistic creed. He afterwards, at the request of Archbishop Parker, published an answer to an 'Admonition of Parliament' (drawn up by a clergyman named Field), presented to the House of Commons on behalf of the Puritans, in which it was maintained that, in matters of doctrine and discipline, the church should admit nothing as authoritative but what was contained in the Word of God. This work was published in 1572. It has always been held that in it W. vindicated the position of the Anglican Church against the Puritans with no less ability than Bishop Jewell shewed in defending it against the Romanists. He was answered by Cartwright on behalf of the Puritans; he replied, and Cartwright rejoined; and as the works on either side were revised by the most learned and eminent men of the two parties, they give an excellent view of the state of opinions in the Anglican Church at this time. After becoming primate, W. laboured assiduously to secure uniformity of discipline in the church. He had the full confidence of Queen Elizabeth, who placed all the church patronage of the crown, including the bishoprics, in his disposal, and he was armed with full powers for carrying out his design. He required the clergy not only to subscribe to the Royal Supremacy, the Liturgy, and the Thirty-nine Articles of the Church, but also to a set of additional articles framed mainly with the view of purging the church of Puritanism. The bishops were required to administer those tests; and the clergymen who refused to accept them were deprived of their livings. This measure was harshly conceived; but W. is said to have been a kindly man, and to have used his authority over the clergy gently, especially in his later years. He was made a Privy Councillor in 1586, and in that capacity drew up a set of statutes for cathedral churches, to make their services conform to the principles of the Reformation. He was offered the chancellorship by Queen Elizabeth, but he declined the office. On the accession of King James, he seems to have been much alarmed for the stability of the system which he had spent his life in rearing; and though the monarch treated him with the utmost observance, anxiety upon this account is said to have hastened his end. He died of paralysis on the 29th February 1603. He is undoubtedly entitled to rank with the ablest and most distinguished prelates that have adorned the English Church. He founded a magnificent hospital and a grammar-school at Croydon.

WHITING (*Merlangus*), a genus of fishes of the family *Gadida*, differing from the cod, haddock, and their congeners (*Gadus*, or *Morrhua*) in having no barbule on the lower jaw, and also in their more slender form, which adapts them for pursuing their prey more actively and further from the bottom of

the sea. The **COMMON W.** (*M. vulgaris*) is abundant on many parts of the British coast, particularly on the western coasts of Britain, and on the coasts of Ireland; on the northern coasts of Scotland it is comparatively rare. It not unfrequently attains a weight of three or four pounds—although the whittings brought to market are seldom of this size; but a W. has been taken of seven pounds weight. The head and body are compressed; the deepest part is at the vent, which is opposite the middle of the first dorsal fin; the upper jaw extends a little beyond the lower; both jaws have long sharp teeth, and there is a triangular patch of teeth on the palate. The scales are small. There are three dorsal fins, and two anal fins; the tail-fin

Whiting (*Merlangus vulgaris*).

is even. The colour is dusky yellow on the back, the sides paler, the belly silver white; there is a black spot on the upper part of the root of the pectoral fin. The W. is a voracious fish, preying on molluscs, worms, crustaceans, and small fishes. It is caught chiefly by hand-lines and long lines; mussels and pieces of cuttle-fish are very generally used for bait. It is in high esteem for the table, and is regarded as particularly delicate and easy of digestion. The flesh is of a pearly whiteness, whence the English name. It very soon suffers change, however, and is in good condition only a short time after being caught; but great numbers of small whittings are sent to market, salted, and dried, under various names.—Another species of W., Couch's W. (*M. albus*), is sometimes taken on the British coasts. It is more abundant in the Mediterranean. It is more slender than the Common W., and the under jaw is a little longer than the upper. The Coal-fish (q. v.) and the Pollack (q. v.) also belong to the genus *Merlangus*.

WHITING is an impure carbonate of lime, prepared by grinding and then washing chalk, so as to separate the coarser particles from the finer ones, which are collected in masses, and dried. It is extensively used for size-painting, and as an article of household economy, for cleaning plate; and on emergency, may be employed as an antidote (in suspension in milk) in cases of poisoning with oxalic, or one of the mineral acids.

WHITLOW, or **PARONYCHIA**, is a painful inflammatory affection of the phalanges of the fingers, almost always proceeding to suppuration. There are several varieties of this affection, according to the texture primarily attacked; thus, it may be situated in the skin, the cellular (or connective) tissue beneath the skin or under the nail, the tendons or tendinous sheaths running along the fingers, or the periosteum. If the skin be the seat of inflammation, vesicles appear, which soon discharge pus, after which relief is rapidly afforded. Such cases require little care or attention, and give rise to hardly any constitutional disturbance. If the cellular tissue is the primary seat of inflammation, there is a painful sensation of tenseness and

throbbing of the part, and often considerable febrile disturbance, until the pus can be evacuated. Although this form is painful, no serious mischief is to be apprehended. When, however, the tendons and their sheaths, or the periosteum, are affected, a much more serious form of whitlow is developed, which has been already discussed in the article **TENDON**. In this form, the suppuration may extend up the arm, and occasion destruction of the joints, and even death.

Whitlow may originate either spontaneously, or after an external injury, such as a prick from a needle, thorn, &c. In the treatment of the milder forms, the finger or thumb should be held for half an hour or longer in water as hot as can be borne, after which lunar caustic should be rubbed freely over the painful surface; and if there are any febrile symptoms, the patient may take a powder, consisting of 4 grains of calomel, 3 of James's Powder, and 3 of Dover's Powder, at bedtime, to be followed in the morning by an ordinary black draught. The hot local baths should be carried on till matter shews itself; and as soon as its presence and seat are determined with certainty, an incision should be made, to admit of its escape. Even if suppuration has not taken place, a free incision into the inflamed part often gives great relief. There is a very pernicious popular idea that the application of cobblers' wax, or some other stimulating substance, will draw the inflammation to the surface, and bring the whitlow 'to a head.' There is reason to fear that a considerable number of fingers are annually sacrificed to this delusion. As it is not always easy to state in an early stage how a whitlow may turn out, it is advisable that surgical aid should always be at once obtained.

WHITNEY, ELI, American inventor, was born at Westborough, Massachusetts, December 8, 1765, and was educated at Yale College, where he paid his expenses, partly by school-teaching, partly by mechanical labour. Having graduated in 1792, he went to Georgia as a teacher; but finding a generous patron in the widow of General Greene, of the Revolutionary army, he resided on her estate, and studied law. The cotton culture at this period, especially that of the best kind, the 'green seed,' was limited by the slow and difficult work of separating the cotton from the seed by hand; but Mrs Greene told her complaining neighbours that she was sure W. could help them out of their trouble, for he could make anything. At their desire, he set to work under great disadvantages, for he had to make his own tools, and even draw his own wire; but the reports of his success prompted some lawless people to break into his workshop, and steal his machine, and get others made before he could secure a patent. He, however, formed a partnership with one Miller in 1793, and went to Connecticut to manufacture cotton gins; but the lawsuits in defence of his rights took all his profits, and 50,000 dollars voted him by the state of South Carolina. Finally, in 1798, he got a government contract for the manufacture of firearms, and was the first to effect the division of labour, by which each part was made separately. He made a fortune by this manufacture, carried out with ingenious machinery at Whitneyville, Connecticut; while he had but barren honour from the gin, one of the most important of the whole series connected with the cotton manufacture. He died at New Haven, January 8, 1825. See **CORRON**.

WHITSTABLE, a long, straggling, maritime village in Kent, on the south shore of the mouth of the Thames, at the mouth of the Swale, 6 miles north-north-west of Canterbury, with which it is

connected by railway. It is noteworthy chiefly because some of the largest artificial oyster-beds lie off the coast, which are regularly farmed by different companies and proprietors. There are breweries, rope-works, copperas-works, and boat-building-yards. Some Roman pottery has been found among the oyster beds, indicating that probably a Roman station existed here. Pop. (1851) 3086; (1861) 4183.

WHITSUNDAY, in Scotland, is one of the usual terms for regulating the letting of houses and farms. It was formerly movable, but was fixed by stat. 1690, c. 39, to mean the 15th May. In many respects, however, local usage overrules the statute; thus, in Edinburgh, the term of entry to a house is the 25th of May.

WHITSUNTIDE ('White-Sunday-tide'), the English name of the season of Pentecost (q. v.), is so called from the white garments anciently worn by the newly-baptised catechumens, to whom that sacrament was usually administered on the vigil of Pentecost. The name 'Whitsuntide' comprehends the entire octave or the week which follows Pentecost Sunday; but the word is more strictly applied to the Sunday, Monday, and Tuesday of that week. The two latter days, down to a very recent date, were observed in the Roman Catholic Church as holidays of strict obligation. Many festive observances and celebrations were anciently practised in connection with the Whitsuntide holidays, which in England and other Protestant countries still subsist, having outlived the religious association out of which they originated.

WHITTIER, JOHN GREENLEAF, American author and poet, was born at Haverhill, Massachusetts, December 1807, in the Society of Friends. He worked on a farm and at shoemaking in his boyhood; but at the age of 18, having a strong desire for learning, he studied for two years at a local academy. In 1829, he became editor of the *American Manufacturer*, a paper established at Boston to advocate a protective tariff; in 1830, he was editor of the *New England Review*, at Hartford, Connecticut, where he wrote a *Life of Brainerd*, and *Legends of New England*. The subjects of these legends he afterwards worked out in his poems, as *Mogg Megone*, *Bridal of Pennacook*, *Cassandra Southwick*, and *Mary Garvin*. Returning from his literary labours to his farm, he was, in 1835, elected to the Massachusetts legislature; and in 1836 appointed Secretary of the American Anti-slavery Society, and became editor of the *Pennsylvania Freeman* in Philadelphia; and in 1840 removed to Amesbury, Massachusetts, as correspondent of the *National Era*; and has since devoted himself to literature and philanthropy. His principal writings are—*Voices of Freedom*, poems collected in 1836; *Leaves from Margaret Smith's Journal*, poems collected in 1836; *Old Portraits and Modern Sketches*, biographical, 1850; *Collected Poems*, 1850; *Songs of Labour*, and other Poems, 1851; *The Chapel of the Hermits*, and other Poems, 1853; *Literary Recreations*, 1854; *The Panorama*, and other Poems, 1856; *Home Ballads*, and other Poems, 1859. These poems have fine elements of vigour, a rugged picturesqueness, a correspondence of rhythm and sound to sense, and a rendering of popular feeling, which have given them a wide circulation. His latest publication is *The Tent on the Beach*, and other Poems, 1867.

WHITTLESEY, or **WHITTLESEEA**, a decaying village and market-town in Cambridgeshire, 5 miles east of Peterborough. The population in and about W. are mostly employed in agricultural pursuits and in brickmaking. *Whittlesea-mere*, a shallow

lake, which formerly existed in the north of Huntingdonshire, 4 miles south-west of W., was 2 miles in length by 1 in breadth, and abounded in fish, water-fowl, &c., is now drained and laid out in fens, which are under cultivation. W. is connected by a branch with the Great Northern and Great Eastern Railways. Pop. (1851) 5472; (1861) 4496.

WHORTLEBERRY (*Vaccinium*), a genus of small shrubs, of the natural order *Vacciniaceae*, having a 4—5-toothed calyx, a 4—5-cleft bell-shaped or urceolate corolla, with the limb bent back, 8 or 10 stamens, with two-horned anthers, and a 4—5-celled many-seeded berry. The species are numerous, mostly natives of the northern parts of the world, with evergreen or deciduous, more or less ovate leaves.—The **COMMON W.**, or **BILBERRY** (*V. myrtillus*), called in Scotland the *Blaeberry*, is very common in Britain, and in the middle and north of Europe. It is found also in Iceland and in the northern regions of North America. It delights in dry situations, but is often found in woods, and often on very elevated mountains. It varies from a few inches to almost two feet in height, and has ovate deciduous leaves, and dark purple berries. A variety occurs, but rarely, with white berries. The berries are very sweet and agreeable, and are much used for making jelly. A kind of spirituous liquor is also made from them in Germany.—The **BOG W.**, or **GREAT BILBERRY** (*V. uliginosum*),

Whortleberry (*Vaccinium myrtillus*).

is common in the northern parts of Britain, and in the north of Europe and Asia. It is said to cover extensive tracts in Greenland. It grows in marshy situations, and is a taller plant than the Common Whortleberry. It has deciduous, obovate, entire leaves, and a fruit larger than the Common W., and inferior to it in flavour. The fruit is said to cause giddiness when eaten in large quantity. An intoxicating liquor is made from it in Sweden and in Siberia. The only other British species is the **RED W.** (*V. vitis-idaea*), which is often called *Cranberry*, because of the similarity of its acid fruit to the Cranberry (q. v.). It is a native of the north of Europe, Asia, and America, and is plentiful in some parts of Britain. Its fruit is much esteemed for preserves, and is used in the same way as the cranberry. Large quantities are sent to the south of Europe from the shores of the Gulf of Bothnia. The plant is a pretty dwarf shrub, with obovate evergreen leaves, and racemes of flowers. *V. buxifolium* is generally regarded as a mere American variety of it.—Many species of *Vaccinium* are in occasional cultivation as ornamental shrubs, and the fruit of most of them is agreeable, although in general it wants acidity. Their more general cultivation has perhaps been prevented by the prevalent notion that they require a peat soil, but they succeed on other soils also. Most of them are North American, and the fruit of some of them is often brought to market in North American towns.—The **BLACK W.**,

or **HUCKLEBERRY** (*V. angustifolium* or *Gaylussacia angustifolia*), is a shrub about two feet high, much branched and erect, with deciduous oval leaves. The berries are of a shining black colour, and sweet. It is widely diffused from Canada to Georgia. The **BLUE TANGLE-BERRY** (*V. frondosum*, or *Gaylussacia frondosa*) is a rather larger and more spreading shrub, which grows near lakes and springs. The fruit is slightly acid.—The **BEAN W.** (*V. ursinum*, or *Gaylussacia ursina*) is found on the mountains of North Carolina; the **BOX-LEAVED W.** (*V. brachycerum*, or *Gaylussacia brachycera*) in Pennsylvania and Virginia. There are other North American species, as *V. Canadense*, *V. humifusum*, and *V. parvifolium*, humble evergreen shrubs. Several species are natives of Mexico. *V. arctostaphylos* is a native of the coast of the Black Sea; and *V. padifolium* is a native of Mount Caucasus and of Madeira, on the loftiest parts of which island it forms impenetrable thickets, growing from six to ten feet high.

WHY'DAW, or **WHIDAW**, a maritime province of Dahomey (q. v.), on the Bight of Benin. It is populous and very fertile, and exports palm-oil, gold-dust, ivory, and many slaves.—The town of W. is the principal seaport of Dahomey, and in population the second town of the kingdom, being inferior only to Abomey. The pop. is supposed to be about 15,000. It is situated about a mile and a half from the sea, close to a lagoon and a swamp, between which and the sea a sandy neck intervenes. Into the lagoon flow several rivers, scarcely known except to slave-traders.

WHYDAW BIRD, **WHYDAW FINCH**, or **WIDOW BIRD** (*Vidua*), a genus of birds of the family of Weaver-birds (q. v.), having long wings, and a boat-shaped tail, the two middle feathers of the tail of the males excessively lengthened during the breeding-season. The name is derived from the country of Whydaw in Western Africa, and Widow Bird is a mere corruption of it, which, however, has given to the genus its name *Vidua* (Lat. widow), regarded as appropriate, because the long tail of the male drops off after the breeding season, and also because of the general dark colour of the plumage. The species are natives of the tropical parts of Africa and the south-east of Asia. They are frequently brought to Britain as cage-birds, both on account of their plumage and the sweetness of their song. The best known species (*V. paradisica*) is a small bird, about the size of a canary, with black and brownish-black plumage, with a broad collar of orange-rufous colour, and breast of somewhat similar colour; two feathers of the tail in the male very broadly webbed in the breeding season, and ending in a hair-like shaft, two feathers very much elongated, sometimes a foot in length, and about three-quarters of an inch in breadth.

WICHERN, **JOH. HEINRICH**, superintendent of the Rauhes Haus (q. v.), near Hamburg, and known by his exertions in the affairs of the German Home Mission, was born at Hamburg on the 21st April 1808. He attended the Gymnasium of his native town, and then studied theology at Göttingen and Berlin. Shortly after passing his examinations at Hamburg, he directed himself to practical usefulness, visited the poor and the wretched in the courts and lanes of the town, and undertook the direction of a Free Sunday School for poor children, in which he soon gathered round him from 400 to 500 scholars, instructed by 40 voluntary male and female teachers. At this time, W. declined the offer of a teacher in the neighbourhood of Hamburg, as he already entertained the idea of an institution such as the Rauhes Haus, which he opened in 1833. From about 1840, W. was much engaged with undertakings of a

similar kind in Germany, to which his mother-institution gave rise. The example was soon followed by France on a great scale (Mettray, near Tours), then by England, Holland, and other countries. It was chiefly through the instigation of W., that at the first Protestant Ecclesiastical Assembly held at Wittenberg in 1848, for the purpose of concerting united action, a central Home Mission Committee was appointed, under which title W. had formed the idea of comprehending all exertions on behalf of the poor, the miserable, and the morally and religiously lost. This Home Mission has exerted a wide and beneficial influence on the north of Germany; and as a member of the committee, W. found in it an extended field for his exertions. Travelling through all parts of Germany, W. was the means, by his exhortations, of founding all sorts of institutions and societies for education and the care of the sick, of the poor, and of prisoners. On his return from a visit to England in 1851, the Prussian government commissioned him to inspect all the houses of correction and prisons, and to suggest improvements. Prevented by this constant practical usefulness from any great literary effort, he published but little. In his *Home Mission of the German Evangelical Church* (Hamburg, 1849), he explains his views of Christian charity, and its relation to the ecclesiastical and social questions of the day. Since 1848, he has published his *Fliegende Blätter* (Fugitive Leaves), which contain parts of discourses delivered by him at the ecclesiastical diets. In 1851, W. received from the university of Halle the degree of D.D.

WICK, a royal, parliamentary, and municipal burgh and seaport, capital of Caithness-shire, stands on both sides of Wick Water, at the mouth of that stream, and at the head of an inlet called Wick Bay, 16 miles south-south-west of Duncansby Head, and 20 miles east-south-east of Thurso. The parliamentary boundaries include the royal burgh, containing about 1850 inhabitants, which, with the suburbs of Louisburgh and Boathaven, containing 1000 more, lie on the north side of the river and bay, and Pulteney-town on the south side, having a pop. of about 5000—the total pop. of the parliamentary burgh being, in 1861, 7475. Pulteney-town, a settlement of the British Fisheries Society, is a flourishing town, managed by Improvement Commissioners under a local act of parliament. The bay is about a mile long by half a mile broad, exposed to frequent storms from east and north-east. There is at present an excellent tidal harbour of considerable capacity, the property of the said society, which is now in course of constructing an extensive break-water, in deep water, which will cost over £120,000; but several years are still required for its completion. The institutions within the parliamentary burgh comprise a county court-house and prison, nine churches and chapels, a town-hall, the Pulteney-town Academy, and a chamber of commerce. There are two weekly newspapers. W. is, and has been for many years, the great centre of the herring-fishing in Scotland, though of late years the take has not been so great as it had formerly been. Everything in the town is subservient to the herring-fishery; and the trades—chiefly barrel-making, boat-building, and rope-making—are directly supported by it. In 1866, the number of boats employed in the herring-harvest was 922, and the take amounted to 59,000 crans. In 1865, 1745 vessels, of 159,752 tons, entered and cleared the port. The usual industries of a county town are prosecuted with considerable spirit.

WICK, the material used for the centre of candles and lamps, which, from its porous nature, draws up the oil by capillary attraction in such quantities as

to burn easily. Usually, wicks are made of cotton, but formerly flax, hemp, and rushes were used. For ordinary candles, the wick consists of a bundle of cotton thread, lying parallel with each other; but for wax, spermaceti, paraffin, stearin, &c., they are usually of twisted or plaited cotton. Very ingenious contrivances have been applied to the manufacture of candle-wicks, to prevent the necessity of snuffing. See CANDLE.

WICKLOW, a maritime county of the province of Leinster, Ireland, is bounded on the N. by the county of Dublin, E. by the Irish Channel, S. by the county of Wexford, and W. and S.W. by the counties of Carlow and Kildare. Its greatest length is 40 miles, and greatest breadth 33; the total area being 781 sq. m., or 500,178 acres, of which 200,393 are arable; 200,754 uncultivated; 17,000 in plantations; 341 in town; and 1090 under water. The pop. in 1851 was 92,978, and in 1861, 86,179, of whom 70,044 were Catholics, 15,285 Protestants of the Established Church, and the rest Protestants of other denominations. The coast-line stretches in a southerly direction about 39 miles, is in many parts precipitous, and being, moreover, obstructed by sandbanks, is very dangerous for shipping. The surface ascends in some parts most abruptly from the sea, and a large portion is mountainous and unproductive. The Wicklow Mountains, however, form rather a group than a range, and on the western and north-western side, decline less precipitously towards the central plain. The most elevated point is Lugnaquilla, which is 3039 feet above the level of the sea. Several other peaks approach this elevation, and the glens which lie between the several mountains or groups are exceedingly picturesque, especially Glendalough, Glendalure, Imail, the Glen of the Downs, and Avoca, the scene of Moore's well-known Irish melody, *The Meeting of the Waters*. The valleys are, for the most part, of limited extent; but some plains of considerable size lie upon the eastern and southern shore. The lakes, although strikingly beautiful, are few in number, and of small size; and the rivers, some of which drain the eastern, and others the western slope, are little more than mountain streams, at least so far as their course lies within the limits of this county. The Liffey and Slaney rise in W., but do not reach any considerable volume until after they have issued from it. The great central group of mountains is a mass of granite, which protrudes through mica and clay slate, to which latter formation the minor elevations both on the eastern and the western side generally belong. The granitic protrusion, which is one of the most remarkable and best defined in the kingdom, falls away on the east side towards the sea, and on the west, towards the great central limestone. The minerals of W. are numerous and varied in character. In the granite and mica-slate are found galena, green and white lead ore, and copper pyrites. From the clay-slate tract are obtained gold, silver, copper, iron, lead, zinc, tin, tungsten, manganese, arsenic, and antimony. The quantity of gold found is very small. Silver is found in combination with lead, which is raised with great success and profit at Glenmalure. The copper mines also are very productive; and of late years, the utilisation of the sulphur, which was formerly wasted, has added largely to the profit of the mining operations.

The climate resembles that of Wexford (q. v.). The soil is very various in character. In the mountains, it is thin and poor, but generally dry, although there is a considerable proportion of bog. In the valleys and level districts, the subsoil is generally gravel, and the soil is for the most part either dry, or, even in the boggy districts, susceptible of drainage. On the

whole, in the lowlands, the soil is moderately fertile; but there is little cultivation of wheat, the chief agricultural pursuits being dairy-farming and grazing; and the culture, on a limited scale, of barley, oats, turnips, and potatoes. In 1862, the acreage under crops was 118,590, of which very nearly one-half—viz., 58,368—was under meadow and clover; 31,238 under oats; 13,780 under potatoes; 5898 under wheat; 5231, turnips; 2401, barley; and the rest under the minor crops in small proportions. Flax-culture in 1862 was entirely blank, and in the year 1861 was represented but by a solitary acre. In 1862, the number of cattle was 74,138; sheep (of which a small breed prevails in this county), 174,320; horses, 13,007; and pigs, 22,613. The total annual value of property in W., under the Valuation Act, is £259,988. There is a large number of villas and many residences of great architectural pretensions, with extensive and highly cultivated parks, especially in the picturesque district which lies between Bray and Wicklow. The county is divided into eight baronies. The principal towns are Wicklow (q. v.), the capital, Arklow, Baltinglass, Shillelagh, Rathdrum, Bray, and Newtown-Mount-Kennedy. W. returns two members to the imperial parliament. W. is described by Ptolemy as the territory of the Cauici, and the names of the rivers mentioned by him are still traceable in their modern appellations. At the invasion, the greater part of the lands of W. were granted to Maurice Fitzgerald, and W. was included by John in the shire of Dublin. Generally speaking, however, the authority of the English in W. was little more than nominal; the territory being under the command of the chief of the O'Byrne. A vigorous effort was made by the Lord-deputy, Sir Arthur Chichester, to establish the king's authority in W., and in 1605 it was erected into a separate county; but again, in 1641, the population joined in the general uprising. From the date of the settlement, however, they were effectually held in subjection. During the rebellion of 1798, W. was the scene of more than one conflict, and the peasantry, in some districts, suffered severely from the vindictive character of the repressive measures adopted by the ascendant party.

W. abounds with antiquities of the highest interest. Many tumuli, raths, cromlechs, and other Celtic remains are preserved; and there are very many ecclesiastical remains of almost every period of Irish Christian architecture; those of Glendalough, which include a round tower, are especially interesting.

WICKLOW, a seaport, capital of the above county, is situated at the mouth of the river Vartrey, N. lat. 52° 58', W. long. 6° 3', 32 miles south-south-east from Dublin, with which city it is connected by the Wicklow, Wexford, and Waterford Railway. The pop. in 1861 was 3448, of whom 2673 were Catholics, 649 Protestants of the Established Church, and the rest of other denominations. It is an assize town, the smallest in Ireland. The municipality is administered by 16 town commissioners; but although it is a seaport the export trade is extremely small; nor are the fisheries of much value. The principal exports are the products of the mining operations and the agricultural produce of the district. The streets are narrow and ill built, nor is there any public building deserving of notice.

WICLIFFE, JOHN DE, the greatest of all the 'Reformers before the Reformation,' was born in 1324, and is supposed to have been a native of the parish of the same name, near the town of Richmond in Yorkshire. He studied at Oxford; but of his early university career nothing is known.

W. first emerges into public notice in 1361, when

his name appears as master of Balliol Hall—as Balliol College was then called. In May of the same year he was instituted to the rectory of Fylingham in Lincolnshire, and shortly after resigned his mastership and went to reside at his rectory. About 1363 he took his degree, and began to read lectures on divinity at Oxford, in which his anti-Romish views were first expounded. In 1368, he exchanged the rectory of Fylingham for the living of Ludgershall, in Bucks; and in 1374, was presented to the parish of Lutterworth, of which he remained priest till his death.

In the great struggle maintained by Edward III. and his parliament against the pretensions of the papacy, regarding the exaction of certain tribute-money which had been granted by King John in acknowledgment of the fealty of the kingdom to the Roman see, W., who had been advanced to be one of the king's chaplains, was called upon to reply to a defence of the papal claim, which had been anonymously sent abroad. This he did publicly at Oxford in an ingenious and powerful manner, and thus early shewed his antipathy to the pretensions of Rome. A clear evidence of his growing reputation is furnished by his appointment, in 1374, as second in a commission sent to Bruges to confer with the papal legate as to certain abuses on the part of the papacy complained of by the English parliament. It was probably on his return from this mission, that W. was promoted to a prebend in the diocese of Worcester, and at the same time presented to the rectory of Lutterworth in Leicestershire. Here he laboured with great zeal, preaching not only on Sundays, but on the several festivals of the Church, and shewing himself 'a most exemplary and unwearyed pastor.' Here also he began at length to speak his mind as to the papacy. The insight into papal doings which he had received at Bruges seems to have confirmed suspicions previously forming in his mind, and he is said, soon after his return to England, to have styled the pope 'Antichrist,' 'the proud worldly Priest of Rome, the most cursed of Clippers and Purse-kervers' (cut-purses). Then began in real earnest his troubles with the hierarchy. In the beginning of 1378, he was summoned to a meeting of Convocation, to be examined for his opinions. He obeyed the summons, but he appeared attended by his friend John of Gaunt and others. A great tumult ensued, the London citizens bursting into the chapel, and frightening the synod of clergy, who were ordered to sist proceedings. The papal authority was then invoked against him, and Gregory VI. issued several bulls, three addressed to the Archbishop of Canterbury and other bishops, one to the king, and one to the university of Oxford, commanding an inquest into the erroneous doctrines attributed to the Reformer. W. was accordingly again summoned before the prelates at Lambeth; but on this occasion also he was favoured by circumstances, and escaped merely with an injunction to refrain from preaching the obnoxious doctrines.

These proceedings only served to make W. a more thorough Reformer. He now entered upon his great work of translating the Scriptures, and circulating them among the common people. He had a great retinue of poor preachers, who went from village to village bearing copies of parts of them. He also challenged the doctrine of transubstantiation. Many of the people, the burghers and the middle class, heard him gladly, and matters seemed tending to an open rupture with the papacy. But the times were not as yet ripe for this. Many who otherwise sympathised with the Reformer were afraid of his views about transubstantiation. He was especially summoned to answer on this head, first,

before a synod at the Greyfriars, London, and finally before Convocation in 1382. He appeared, and defended himself with great subtlety and power. His defence was unavailing. Twenty-four 'erroneous' statements were picked out of his works, which were in consequence condemned and ordered to be burned. He was banished from Oxford, but was allowed to retire to his parish of Lutterworth. His health was already shattered by hard work and many anxieties, and on the last Sunday of the year 1384, he was struck down by paralysis while conducting public worship, and two days afterwards expired. *W.* appears to have been a man of simple faith and of earnest and manly courage. He made a strong impression upon his age; an impression there is reason to think not entirely effaced even to the time of the Reformation. The Lollards, as his disciples were called, were to be found not only among the poor, but in the church, the castle, and even on the throne. Political mischances, however, overtook the party in the following century, and only a few traces of it survived here and there when the movement of the 16th c. began.—See the Rev. W. Shirley's edition of the *Fasciculi Zizaniorum Magistri Johannis Wyclif* (1858), published under the direction of the Master of the Rolls.

WIDDIN, or WIDIN, a fortified town of European Turkey, capital of an eyalet of the same name in Bulgaria, on the right bank of the Danube, 140 miles east-south-east of Belgrade. It is surrounded on the land-side by morasses, and is defended by a strong citadel, by walls, and by a fortified island in the Danube. Its streets and bazaars are pestiferously dirty. For centuries, *W.* has been a strong post in all the contests between the Turks and their northern neighbours, and it is called by the Turks the Virgin Fort, from its never having been taken. The industries and the active general trade which it carries on, render the town a prosperous one. Ships from the Black Sea can reach *W.* by the Danube at high water. Pop. about 30,000.

WIDGEON, or WIGEON (*Mareca*), a genus of ducks of the non-oceanic section, with the hind-toe not webbed, having the bill shorter than the head, and of equal width throughout, much rounded at the tip, with a broad strong nail; the lamellæ of the upper mandible prominent; the wings long and pointed; the tail wedge-shaped. The species are

Widgeon, Male and Female (*Mareca penelope*).

pretty numerous, migratory birds, appearing in great flocks in the warmer countries which they visit during the winter. The COMMON *W.* (*Anas* or *Mareca penelope*) is plentiful in Britain during winter. A few breed in the most northern parts of Scotland, but the ordinary breeding-place is in more

northern regions. This species is found at some season of the year in almost all parts of Europe, and in Asia, as far south as the north of India. It is found also in North America, along the Atlantic coast. It is known as one of the birds of Japan. Its whole length is about 18 inches. The forehead and top of the head in the male are white, the cheeks and hind-part of the neck reddish chestnut; the upper parts grayish white, crossed with irregular zigzag lines of black; the tail nearly black; the wing-coverts white, tipped with black; the primaries dark brown; a green speculum edged with black; the throat, pale rufous; the breast and belly, white. The female is very different, the head and neck rufous brown, speckled with dark brown; the back varied with two shades of brown, darker in the centre, and paler in the edges of the feathers. The *W.* is the most common of all the duck tribe in Lapland, frequenting grassy swamps, lakes, and rivers. Flocks of *W.* appear in Scotland and England, on lakes and rivers, in winter, and most abundantly in severe winters. They feed during the daytime, and chiefly on grass. The note of the *W.* is a shrill whistle, whence its French name *Siffleur*, and the English names, *Whew Duck* and *Whewer*. Its flesh is good for the table.—The AMERICAN *W.* (*Anas* or *Mareca Americana*) is a larger bird than the European *W.*, being about 22 inches long. The upper parts are finely waved transversely with black and reddish brown, the under parts are mostly white; the top of the head is almost white; the wing-coverts white, the greater tipped with black; the speculum green, encircled by black. It breeds chiefly in the northern parts of America, and is common in winter on the coasts of the United States, and in the rice-grounds. Its flesh is highly esteemed. It is known as an occasional, but very rare visitant in the British Islands.

WIDOW (see *JUS RELICTÆ SUCCESSION, MARRIAGE*). A widow's right to dower, by the common law of England, extends to a life estate in one-third of the lands and tenements of which her husband died seised, and which any issue she may have had might by possibility have inherited. The law of dower was considerably altered by a statute 3 and 4 Will. IV. c. 105; and in cases where married parties are entitled to real property, their rights are generally regulated by contract. There are certain modes of conveying and devising property so as to prevent dower arising, and a widow's right to dower is also generally prevented by giving her a jointure. A woman loses her dower by a divorce, but not by judicial separation or other misconduct.

WIELAND, CHRISTOPH MARTIN, one of the greatest of German poets, was born, 5th September 1733, at Oberholzheim, near Biberach, his father being pastor of that place and afterwards in Biberach itself. The precocity of his powers early excited attention, and when only 12 years of age, he had essayed his poetical talent both in Latin and in German verse. In 1750, *W.* went to the university of Tübingen to study law, but occupied himself more with the classics, and with recent literature both native and foreign. From Tübingen, he returned to Biberach in 1752. At this time, Klopstock's example had an extraordinary influence on him, so that he gave himself up to a mystical piety, foreign to his nature, which he gives utterance to in the *Empfindungen des Christen* (The Christian's Experiences). While in this mood, an invitation from Bodmer led him to give up the intention of graduating at Göttingen, and go to Zürich. The number and nature of his productions at this time shew the effect which the example of Bodmer's desultory way of working was beginning to have

upon him. He soon, however, returned to the more congenial field of the literature and life of the Greeks. The lively interest which he took in Frederick the Great, prompted W. to work out the ideal of a hero in a great poem, for which purpose he fixed on Cyrus. The first five cantos appeared 1757, and a new edition 1759; but the reception it met with was not very cordial, and consequently it remained unfinished. The beautiful episode from the *Cyropaideia* of Xenophon, *Araspes und Panthea*, appeared about this time, and revealed W. as the poet of love. In 1760, he received an appointment in his native town in connection with the law-courts. At this period, he engaged in the arduous task of translating Shakspeare (8 vols., Zür. 1762—1766). However little W., whose mind had been formed after Greek, Roman, and French models, and who was constitutionally inclined to pleasant and easy trifling, was calculated to enter fully into the spirit of Shakspeare, he nevertheless was, for his time, tolerably successful, and opened up the path for his successors.

W. now spent much of his time at Warthausen, near Biberach, the estate of the Count von Stadion, an accomplished and highly intellectual man, but thoroughly a man of the world, and averse to all religious enthusiasm. From the tone of the society he met here, as well as by the course of his reading, W. became imbued with that modern French philosophy which runs through the most of his later writings. In some of these, there is an unmistakable tendency to licentiousness, from which his personal life always remained free; in most of them, however, he has blended the Greek sensibility to outward impressions with the French love of pleasure into a peculiar graceful philosophy of life. The first production which bears the impress of this French-Greek sensuousness, was the poetical tale *Nadine*, which he himself calls a creation in Prior's manner. In 1766 and 1767, *Agathon*, a romance in 3 vols., made its appearance, which greatly contributed to establish W.'s fame. His views on the subject of love are most fully and worthily expounded in the didactic poem *Musarion* (1768), a work of singular grace and harmony of treatment, which he himself called a philosophy of the Graces. W. had, in the meanwhile (1765), married a lady of Augburg, and accepted a call to Erfurt (1769), as Professor of Philosophy in the university. He terminated what may be called the erotic period of his literary career with the *Verklagten Amor* (The Impeachment of Love), wherein he, in a manner, vindicated the kind of poetry to which he had till then devoted himself.

A period of delightful leisure and undisturbed work began for W. when the widowed Duchess Anna Amalie invited him to Weimar (1772), as tutor to her two sons, with the status of Hofrath, and a salary of 1000 thalers, which was continued to him after his duties as tutor ceased. W. was entirely in his own place in the society of the distinguished men (such as Musäus and Von Einsiedel) already gathered round this court; and his genius began to soar more courageously. He wrote his vaudeville, *Die Wahl des Hercules* (The Choice of Hercules), and the lyrical drama, *Alceste* (1773), which were received with great approbation. Of greater importance for German literature was the publication of the *German Mercury*, a monthly periodical, to which W., till towards the close of his life, devoted himself with the greatest earnestness, and which he made the vehicle for disseminating his æsthetical views. On the whole, however, his criticism was neither genuine nor very deep, and suffered from that conventional narrowness which was then dominant in France. His letters on his

Alceste in the *Mercury* (September 1773) contain sufficient traces of this tendency, at which Goethe and Herder were so much offended. The former wrote in relation to it the satire *Götter, Helden, und Wieland* (Gods, Heroes, and Wieland). W. answered the attack with pleasantry and with his characteristic good nature. Shortly afterwards, Goethe himself joined the circle at Weimar, the soul of which was the Duchess-mother, Anna Amalie. W.'s literary powers developed themselves here more and more; and for more than 20 years, almost nothing of any importance occurred, either in the political or literary world, in which he did not take a more or less active part. His literary productiveness shewed itself chiefly in the *Geschichte der Abderiten* (History of the Abderites, 1773), a charming work, depicting the follies of small communities, in which the muse of Wisdom is disguised under the garb of the Satyr. This was followed by a series of tales and stories, partly imitations of foreign originals, and partly of his own invention. *Oberon*, a romantic heroic poem, the most perfect and enduring of his greater works, appeared 1780 (last ed. Leip. 1853). It was followed by the translation of Horace (*Letters*, 1782; *Satires*, 1786) and of Lucian (1788). W. pronounced the *Epistles* of Horace with the commentaries to be those of his works on which he put the greatest value. He has given us a complete sketch of his conception of the Greek world in the *Aristippe* (1800). A collected edition of W.'s works up to 1802, in 36 vols., with 6 supplementary vols. in large quarto, and large and small octavo (new edition with the poet's life, 53 vols., 1828; 36 vols., 1839), was got up by the bookseller Göschen in Leipzig. From the proceeds, W. was enabled to buy the estate of Omannstädt, near Weimar. From 1798 to 1803, he lived here in the circle of his numerous family (his wife, in the course of 20 years, had brought him 14 children), and devoted the greatest part of his time to literary labours, among which his *Attic Museum* (1798—1804) and the *Neue Attic Museum* (1805—1809) were not the least. In these publications, he strove to make his countrymen familiar with Greek poetry, philosophy, and rhetoric. In 1803, he sold his estate, and returned to Weimar, where he very soon became intimate with Schiller. Here he lived to see the day of the battle of Jena, the death of the Duchess Amalie, and also of Herder and Schiller. The marks of honour which he received from Alexander and Napoleon, and his admission to the French 'Institut,' helped to alleviate his many griefs, among which one of the greatest was the death of his wife, 1801, with whom he had lived for so many years in great happiness. His own death took place 20th January 1813.

W. had neither the spirit of a reformer like Klopstock and Lessing, nor did he attain the poetical greatness of Goethe or Schiller; nevertheless, he did great service to German literature, which has not always been sufficiently recognised. He gave to German poetry, as it was rising into true national importance, the still wanting grace and harmony of expression and versification, in which respect Goethe learned much from him. The poetic handling of mediæval chivalry was an entirely new creation of his, and thus the school of romantic poetry is indebted to him for its origin. He also introduced poetical materials from England, France, Spain, and Italy, which were not without influence. In all his appropriations W. exercised that fine discernment which seizes upon what is universally human, so that he nowhere appears as a blind imitator. His criticism, too, with all its shallowness, contributed much to the diffusion of general culture.—Compare, besides Gruber's

Biographie Wieland's (4 vols., Leip. 1827; vols. 50—53 of the *Works*), *Wieland's ausgewählte Briefe* (4 vols., Zür. 1815), *Auswahl denkwürdiger Briefe* (2 vols., Wien, 1815), and *Briefe an Sophie Laroche*, Berl. 1820).

WIELICZKA, a small town of Austrian Galicia, 10 miles directly east-south-east of Cracow, and the same by railway. It is remarkable for its salt-mines, in which the majority of its inhabitants (about 6000 in number) are employed. The mines were discovered in 1250, and have been continuously worked since that time; though some assert that there is abundant evidence to prove that they have been worked since the 9th century. The town itself is entirely undermined by the excavations, which extend upwards of 9590 feet from east to west, 3600 feet from north to south, and are 1780 feet in depth. The mines extend to four stories or 'fields,' one below the other. In the second story, the visitor is rowed across a salt lake, and when he has reached and is exploring the third story, he is informed that the lake he lately crossed is now right above his head. The stories are simply large chambers excavated in one enormous mass of rock-salt, of great purity, and apparently of inexhaustible extent. In one of the chambers, the miners have scooped out a Gothic chapel from the solid salt-rock, and have carved, not without skill, a number of statues and obelisks from the same material. The mines produce 55,121 tons English per annum.

WIEßBADEN, a town of Prussia, formerly capital of the independent duchy of Nassau, one of the oldest and most famous of the German watering-places, delightfully situated on the south slopes of Mount Taunus, 26 miles west of Frankfurt, and 5 miles north-west of Mainz by railway. The town has been called 'a city of lodging-houses,' and this may be understood from the fact, that during the 'season' the number of the visitors is greater than that of the resident inhabitants. But though almost every house is appropriated to the reception or entertainment of guests, the town is well and regularly built. The *Kursaal* comprises an extensive dining-hall, in which frequently 300 people sit down to dinner, and which also serves as a ball-room, together with reading and gaming rooms. In the large gardens behind the *Kursaal*, it is the habit of the visitors to sit in the evenings at their numerous small tables, regaling themselves with coffee or ices—the men smoking, the women knitting—and all either chatting or listening to the music played by a band on such occasions. Other buildings are the *Schlösschen* (Little Palace), containing a library of 60,000 vols., and a collection of antiquities, in which are a number of curious Roman *bassi-relievi*, statues, altars, &c. found in the vicinity; the handsome Protestant church, finished in 1860; the superb Greek chapel, built by the Duke of Nassau as a mausoleum, in which repose the remains of his first wife. There are 14 hot springs, all of a high temperature, and numerous bathing-houses throughout the town; but the principal is the *Kochbrunnen* (Boiling-spring), the temperature of which is 156° Fahr. The spring has all the appearance of a boiling caldron, and so copiously does it pour forth its waters, that, though they are used both for drinking and to supply the principal baths in the town, a vast quantity escapes, and runs away through gutters and drains, sending up clouds of vapour in its passage along the streets, and adding to the warmth of the temperature of W. in summer. Next in heat and volume to the *Kochbrunnen* is the spring that rises in the garden of the *Adler* (Eagle) Hotel, the temperature

188

of which is 134° Fahr. The use of the W. hot-springs is considered highly efficacious in cases of gout, rheumatism, scrofula, and other skin diseases and nervous affections. The waters of these springs are saline, and contain silica and iron. The prosperity of W. is entirely due to its springs; and the beauty of its situation and environment, the agreeable walks and rides, the charming views of the vicinity, and the never-failing gaiety that prevails during the season, render it one of the most popular of the spas. The season lasts from June to September, and the number of visitors annually is over 20,000. Pop. (1862) 20,797.

W. is very ancient; its springs are the *Fontes Mattiaci* mentioned by Pliny. The Romans built a station here, and erected a fort on a hill on the north-west side of the town, still known as the *Römerberg*, and which was garrisoned by the 22d Roman legion. The *Mattiaci*, a subdivision of the German tribe called the *Catti*, allied themselves with the Romans; but in the 3d c., the barbarian Germans rose against the Romans, and destroyed their forts, including Wiesbaden. Urns, tiles, coins, &c. are found abundantly whenever the foundation of a house is dug; and that the Romans appreciated the virtues of the waters is proved by the remains of ancient baths that have been found, and by the votive tablets recording the thanks of Romans who had been restored to health by the waters, still preserved in the museum.

WIG (Lat. *pilus*, the hair; *pilare*, to pluck off the hair; from which was formed *pilucare*, and hence *piluca*, a head of hair; this was transformed in Ital. into *perruca*, French *perruque*, whence Eng. *periwig*, shortened into *wig*). The use of false hair for concealing baldness, or for the supposed adornment of the head, appears to belong to all ages and countries. There is an Egyptian wig in the British Museum, supposed to be about 4000 years old; and some of the South Sea islanders are said to be skilful wig-makers. Xenophon mentions that Astyages wore an immense wig. Several of the Roman emperors wore wigs, and Lampridius relates that the wig of the Emperor Commodus was highly perfumed, and sprinkled with gold dust. After this, there are no historical traces of the wig till about the end of the 14th c., when wigs made their appearance in France, and hence spread gradually over other European countries. The fashion of wearing wigs set in strong in the reign of Louis XIII. (1610—1643), and for more than a century, no gentleman of fashion could appear without one. Such was the extravagance in this article of dress, that as much as three guineas an ounce was paid in England for fine qualities of hair, and wigs were made at a cost of £140. It was only towards the end of the 18th c. that the unnaturalness of this ornament appears to have been thought of, and it began to be superseded by the queue with Hair-powder (q. v.). Except by judges and barristers, wigs are now used only in cases of baldness, and then they are made in imitation of nature, which was by no means the case with the wigs of old times.

WIGAN, a prosperous and important manufacturing town, and municipal and parliamentary borough, in Lancashire, on the Douglas, 15½ miles south-south-east of Preston, and about the same distance from Liverpool on the south-west, and Manchester on the south-east. Irregularly built, and notwithstanding a number of improvements made within recent years, W. is not of very prepossessing appearance, and contains few objects worthy of special mention. It stands in the midst of a coal-field; and cannel coal abounds in the

vicinity. Cotton-spinning, and the manufacture of calicoes and other cotton goods, checks, and home-made linens, are extensively carried on. There are also brass and iron foundries, factories for edge-tools, and other metallurgic works, chemical works, paper-works, and corn-mills. The river Douglas, and the Leeds and Liverpool Canal, afford facilities for inland navigation; and communication with the chief towns of this and the neighbouring counties is maintained by railways. Pop. (1851) 31,941; (1861) 37,658.

WIGHT, ISLE OF, an island in the English Channel, remarkable for the variety and beauty of its scenery, and the mildness and salubrity of its climate, lies almost centrally, close off the southern coast of England, in which it is partially embayed, and is divided from it by a channel varying from less than 1 mile to more than 6 miles in breadth, known as the *Solent* (q. v.), which spreads out to the east into the broad and safe anchorage of *Spithead* (q. v.) and *St Helen's Roads*. Its form is remarkably regular, its longer and shorter diameters (22 miles 5 furlongs, and 13½ miles in length respectively) running almost due east and west, and north and south. Its shape is rhomboidal, and has been compared to a bird with expanded wings or to a turbot. It is 56 miles in circuit, and embraces an area, including its inlets, of 98,320 acres. Pop. (1861) 55,182. *Newport*, which returns two members to parliament, the island returning one, is the capital; the other chief towns are *Ryde*, *Cowes*, and *Ventnor* (all described under their separate headings), of which the first and last have sprung up from small villages within the present century. *Yarmouth* is a small decayed town near the western extremity of the island, formerly returning two members, a privilege once also possessed by *Newtown* on the north-west coast, a once important town, now sunk to an insignificant hamlet. On the south-east coast, the delightful health-resorts of *Sandown* and *Shanklin* are fast acquiring the size and importance of towns. Railway communication has been opened between *Ryde* and *Ventnor*, and between *Cowes* and *Newport*. Throughout the island there are good though generally narrow roads; for the most part picturesque and bounded by hedgerows. The chief physical feature of the island, to which it owes its shape and much of its beauty, is a long undulating range of chalk downs, extending, as a kind of backbone, from the *Culver Cliffs* on the east, to the *Needles* on the west, rising to its greatest elevation in *Mottistoun Down*, 661 feet (*Ashey Down* is 424 feet, and *Bembridge Down* 355 feet) above the sea. The river *Medina*, rising near the southern extremity of the island, flows north through a gap in this range, expands into a tidal estuary below *Newport*, and flows into the *Solent* at *Cowes*, and divides the island into the hundreds of the *East* and *West Medina*. In addition to the central ridge, a second range of chalk downs of greater elevation—*St Boniface Down*, 783 feet, *Dunnose* (*Shanklin Down*), 771 feet, *St Catherine's*, 769 feet—rises at the southern point of the island, and expands into a broad promontory, the south face of which forms the picturesque district known as the *Undercliff*, or 'Back of the Island,' of which *Ventnor* is the capital. This district owes its remarkable beauty to a series of land-slips on a gigantic scale, of pre-historic date, which have laid bare a long wall of rugged cliff, below which a succession of sunny terraces, due to the gradual subsidence of the strata, slope gently down to the sea. The whole of this part of the island is completely sheltered from the colder winds, and enjoys a well-merited reputation as a residence for invalids suffering from consumption or any disease of the respiratory organs. Its remarkable healthi-

ness is attested by the returns of the registrar-general, which prove that the death-rate of the district is absolutely the lowest in the kingdom; while the mildness of its climate is evidenced by the luxuriance of the myrtles, fuchsias, sweet-scented verbenas, and other exotics, which not only live through the winter without protection, but attain the size of large bushes.

In a geological point of view, the Isle of W. is most interesting. The great variety of strata displayed within so small an area, under circumstances so favourable for examination, renders it one of the best available localities for the young observer. The north side of the island presents a succession of Tertiary or Eocene strata, including beds of freshwater limestone, which have been extensively worked for building-stone for many centuries, and based on beds of London and Plastic Clay. In *Alum Bay*, at the west extremity of the island, the rapid succession of vertical layers of sand and clays of bright and varied hues, produces a singular and beautiful effect. The central ridge or backbone consists of strata of chalk imbedding layers of flints, and the underlying formations in an almost vertical position. Isolated masses of chalk that, in consequence of their superior hardness, have survived the marine and atmospheric waste, form the well-known *Needles*, at the west opening of the *Solent*, and the picturesque rocks of *Freshwater Bay*. The downs at the south of the island belong to the same formation, but here the strata have been undisturbed, and are nearly horizontal. The cliffs of the *Undercliff* are of the Upper Greensand, or *Firestone*, underlying the chalk. Below this comes the *Gault*, or *Blue Marl*. To the action of the land-springs upon this unctuous formation, the land-slips to which the *Back of the Island* owes its beauty are due. The *Lower Greensand* succeeds the *Gault*, occupying the greater part of the area between the north and south chalk downs. This forms excellent corn-land, and presents a wall of cliff to the sea, diversified with many narrow picturesque gorges, locally known as *Chines*, where a small rivulet has eaten away the friable strata. The chief of these are those of *Shanklin*, *Luccombe*, *Blackgang*, and *Whale Chine*. The freshwater *Wealden* formation is the lowest visible in the island, and is seen in the cliffs of *Brook* to the west, and of *Redcliff Bay* to the east. Bones of the colossal *iguanodon* and other saurians are found in this formation.

The soil of the island is very varied, both in nature and fertility. That of the northern half is, to a considerable extent, a cold, stiff clay, more suited for the growth of wood, especially oak, than corn. Of late years, however, much of the woodland has been cleared, and judicious draining operations, in which the late Prince Consort led the way on the royal domain of *Osborne* (near *East Cowes*), have produced very beneficial results. Farming is still on the whole somewhat primitive; even on large farms the flail may still be seen in use. The soil of the south half is chiefly a red loam, which is exceedingly productive, especially in crops of barley, and, in the more rich and sheltered lands, of white wheat. Red wheat is grown in abundance in other parts of the island; while the stiffer clays of the north grow capital crops of oats. The chalk downs afford admirable pasturage for sheep, which are celebrated for the pureness of their wool, chiefly exported to *Yorkshire*, and which furnish the *London market* with early lamb, as many as 4000 being annually exported. But few oxen comparatively are fattened. The chief exports are wool, corn, flour, cement stones (*septaria*), and white glass-house sand.

The *history* of the Isle of W. presents but comparatively few points of interest. It is supposed, with much probability, to have been the tin mart of the Greek traders mentioned under the name of *Ictis* by Diodorus Siculus. The Romans knew it as *Vecta* or *Vectis*, which is merely the Latinised form of the native name. It was conquered for the Romans by Vespasian in the reign of Claudius (43 A.D.). Cerdic, the founder of the kingdom of Wessex, took the island 530 A.D., and handed it over to his nephews, Stuf and Wiltgar. In 661 A.D., it was reduced by Wulphere of Mercia, and given to Ethelwold, king of Sussex, from whom it was wrested (686 A.D.) by Ceadwalla of Wessex, to whom, under the benign influence of Wilfrid, Archbishop of York, the island owes the introduction of Christianity. During the three centuries preceding the Norman Conquest, it was repeatedly devastated by the Danish pirates, who made it their stronghold, to which they retired with their plunder. William the Conqueror gave it to his kinsman, Fitz-Osborne; Henry I. transferred it to the family of De Redvers, in whose hands it remained till the reign of Edward I., when it passed by sale to the crown. During the French wars of Edward III. and his successors, the island was repeatedly invaded and pillaged by the French. At the close of the reign of Henry VIII., the armada despatched by Francis I., under the command of D'Annebault, made several landings on the coast, and inflicted some damage, but were ultimately driven back by the prowess of the islanders. The most interesting event in the history of the island is the imprisonment of Charles I. in the castle of Carisbrooke, after his flight from Hampton Court, from November 23, 1647 to September 15, 1648. Carisbrooke was also the place of the imprisonment of his children, Prince Henry and the Princess Elizabeth, the latter of whom died there, and was buried in Newport Church, where a beautiful monument by Baron Marochetti has been erected to her memory by Queen Victoria.

Among the celebrated natives of the Isle of W. we may notice Dr Robert Hooke, the experimental philosopher, born at Freshwater, 1635; and Dr Thomas Arnold of Rugby, the regenerator of public-school education, born at East Cowes, 1795.

The antiquities are not numerous. Sepulchral barrows occur on the downs, and Saxon burial-places have been discovered in several localities. There are the remains of a Roman villa, with a tessellated pavement, at Carisbrooke. The remains of Quarr Abbey, near Ryde, are very scanty. Carisbrooke Castle is a fine ruin, occupying a commanding position. The churches are picturesque, but not remarkable for beauty of architecture. There are but few monumental brasses or other sepulchral memorials of interest.

WIGTON, a market and small manufacturing town of Cumberland, in the midst of a specially agricultural district, 11½ miles by railway south-west of Carlisle. It carries on manufactures of ginghams and checks. Pop. (1861) 4011.

WIGTOWN, a county forming the south-west corner of Scotland, is bounded on the W. by the Irish Channel, N. by Ayrshire, E. by the Stewartry of Kirkcudbright and the Solway Firth, and S. by the Irish Sea. Its extent from east to west is computed at from 32 to 34 miles, and from north to south 24 to 28 miles. This county, which constitutes West Galloway, was formed about the year 1341; and is between 54° 38'—55° 4' N. lat., and 4° 16'—5° 6' W. longitude. W. is somewhat irregular in form, being deeply intersected by two arms of the sea, one of which, Loch

Ryan, a long narrow inlet, stretches southwards from the north-west corner for fully 9 miles into the county, while Luce Bay on the south makes a wide indentation 18 miles long with an average of 12 wide, the heads of the inlet and bay being only 6 miles apart. The western part of W., known as the *Rhins of Galloway*, thus forms a peninsula whose length (from north to south) is 28 miles, and breadth 1½—6 miles; its northern extremity is Corsewall Point, and its southern the Mull of Galloway, each promontory being provided with a light-house. The south-eastern half of W. is separated from the Stewartry by Wigtown Bay, 15 miles long and 14 wide at its mouth, and between this latter and Luce Bay, W. extends southwards in a blunt triangular form, terminating in Burrow Head. The inhabitants of W. were originally of Celtic origin, and up to the middle of the 16th c., a Celtic dialect was universally spoken; and for a century afterwards, it was in use in the remote districts. W. is irregular in its surface, but its eminences are inferior in height to those of any other county of Scotland—none of them exceeding 500 feet. The soil is varied, and—with the exception of a portion lying along the sea-shore, especially in the south-east, which consists of a rich loam—the quality is mostly inferior. There is a large extent of moor and moor, mostly of a very poor and unproductive nature, judging from the appearance and produce of much of what has been reclaimed. There has, however, been a considerable improvement made of late years in farm-buildings. The climate is rather mild, but moist, the rainfall being comparatively great. There are many dairy establishments in this county, almost exclusively for making cheese similar to the Somersetshire cheddar. The cows are frequently let for hire at from £9 to £12 per cow, the farmer supplying all food, and the dairyman the labour. Most of the cows are of the Ayrshire breed; it is difficult to obtain the pure native breed of cattle; and the Galloway pony, formerly in such vogue, is now hardly to be met with. The area of W. is over 512 sq. m., or 327,906 acres, of which about three-fifths are either uncultivated or would be unprofitable to reclaim. The government returns for 1866 give 37,242 acres under corn crops, 18,595 under green crops, 38,941 under clover and sown grasses, and 29,845 under permanent meadow pasture. The number of cattle in the same year was 35,703, of which 14,980 are cows; there are 118,669 sheep and 10,273 pigs.

Besides numerous small streams, W. contains three rivers of considerable size, the Cree, which forms the eastern boundary, and the Bladenoch—both of which fall into Wigtown Bay—and the Luce, which empties itself into Luce Bay; the former two are navigable for a few miles, and yield salmon and trout. The county also possesses several small fresh-water lochs. In the Rhins of Galloway, on the south-west, is situated the parish of Kirkmaiden, the most southerly point in Scotland—hence 'from Maidenkirk to John o' Groat's.' There were at an early period a considerable number of religious houses in the county; and the church, believed to be the oldest in Scotland, founded by St Ninian, was built near the site of what is now the village of Whithorn. At the Reformation there were 21 parishes; the number has since been reduced to 17. The principal towns are Wigtown, Newton-Stewart, Stranraer, and Whithorn. There is no mineral wealth, and little trade or manufacture carried on in W. There is a distillery at Bladenoch, a woollen manufactory at Kirkcowan, and some saw-mills and starch-mills at Stranraer and elsewhere. The mail-coach was first run through W. in 1804, and was only superseded a few years

ago by the railway between Dumfries and Portpatrick, from which latter the shortest sea-passage to Ireland is obtained. The old valued rent was £5634; the new valuation in 1836—1867 was £183,962. The pop., in 1861, was 42,095; inhabited houses, 6868; constituency, returning one M.P., in 1866, 1183.

WIGTOWN, a royal, municipal, and parliamentary burgh, market-town, and seaport in the south-west of Scotland, capital of the county of Wigtown or West Galloway, is situated on Wigtown Bay, near the mouth of the Bladenoch Water. It is 40 miles west-south-west of Dumfries, and nearly 150 miles distant by railway from Edinburgh. The parish church was erected in 1852. It is of Gothic architecture, and much superior to the ordinary run of country churches. In the churchyard there are three tombstones in memory of martyrs who suffered in the time of Episcopal persecution. Two of them are old. On the summit of the Windyhill, the highest ground in the neighbourhood of the town, an obelisk of freestone was placed a few years ago, in memory of these same martyrs—two of whom, women, are said to have been drowned here. The authenticity of this event, though lately questioned by some, is doubted by very few in the locality where it is said to have happened. A large and very handsome building, which is used as a town-hall and court-house, was erected in 1863. Pop. (1861) 2101. There is no particular trade carried on in the town. At Bladenoch Bridge, however, which is held to be part of the burgh, although nearly three-fourths of a mile distant to the south, there is a distillery of considerable extent; also an iron foundry and a coach-building establishment. W. unites with Whithorn, Stranraer, and New Galloway in electing a member to the House of Commons. The registered tonnage of the port in 1866 was 3097.

WIKANA, the *Wacaka des Indes* of the French, a dietetic preparation of cacao much used in France for invalids. It consists of roasted cacao nibs and sugar, in the proportion of three parts of the latter to one of the former, well mixed together, and flavoured with cinnamon, vanilla, ambergris, and musk.

WILBERFORCE, WILLIAM, was born at Hull, on 24th August 1759. His father was a wealthy merchant, descended from an old family, proprietors of Wilberfoss, in the East Riding of York. W., at the age of 9, on his father's death, was sent to school at Wimbledon, where, under the care of a pious aunt, he ran the risk of becoming a Methodist. But his mother did not approve of a serious education, and removed him to a Yorkshire school, where the religious impressions he had received were soon dissipated by a life of gaiety. His constitution was delicate, but he was quick and spirited, and fond of society, in which his lively conversation and musical talent made him a great favourite. While at school, he addressed a letter to a York paper 'in condemnation of the odious traffic in human flesh,' a subject he seems never afterwards to have lost sight of. At 17, he entered St John's College, Cambridge, and in due time he passed his examinations with credit. He came, on attaining his majority, into possession of a large fortune, and determined to enter parliament. In 1780, he was returned for Hull. He had known Mr Pitt when at Cambridge, and in London they became inseparable friends. W., in parliament, however, remained independent of party. The elevation of Mr Pitt to the premiership gave him an opportunity of taking office, but he declined to do so. He rendered, however, efficient service to his friend. In March 1784, on the eve of a dissolution, he spoke at a county meeting in York, called to vote an address against the Coalition Ministry; and such

was the effect of his eloquence, that when he had concluded, a resolution had been come to by the freeholders that he should be asked to stand for the county. He did so; and in spite of opposition from the great Whig families, he was returned without a contest. W.'s success in the leading county, set an example to other constituencies, which was of very great advantage to the Pitt ministry. In the same year, W. made a tour on the continent with some ladies of his family and Isaac Milner, the Dean of Carlisle, during which the serious impressions of his youth seem to have been revived. In 1787, he in a great measure eschewed gaiety, and founded an association for the discouragement of vice; and in the following year, while in very bad health, he entered on his great struggle for the abolition of the slave-trade, to which he thenceforward dedicated his whole time. He was powerfully supported by the Quakers, and by Mr Thomas Clarkson, who kept alive interest in the subject beyond the walls of the House of Commons. In 1789, he first proposed the abolition of the slave-trade in the House of Commons, and met, as he expected, with powerful opposition. In 1804, his bill was first carried through the Commons; it was thrown out in the Lords; and in the following year it was again lost in the Commons. In 1806, however, a resolution was moved by Mr Fox, pledging the Commons to a total abolition of the slave-trade in the following session. It was adopted by the Lords. Just before the discussion began in January 1804, a work had been published by W. against the slave-trade, which had a marked influence on public opinion and the subsequent debates. The bill was passed by the Lords. In the Commons, it was carried by an enthusiastic majority. Sir Samuel Romilly, who supported the measure, compared the feelings of Napoleon, then at the height of his glory, with those of the English philanthropist, 'who would that day lay his head upon his pillow, and remember that the slave-trade was no more;' and the whole House burst into applause, and greeted W. with enthusiastic cheers. W. now sought to secure the abolition of the slave-trade abroad. He at the same time entered on an agitation for the total abolition of slavery itself. Declining health, however, compelled him in 1825 to retire from parliament, in which, since 1812, he had sat for the borough of Bramber, having at the latter date resigned the representation of Yorkshire. The movement against slavery was then intrusted to Sir T. Fowell Buxton. Three days before W.'s death, news was brought him that the Abolition Bill had passed a second reading, and he thanked God he had lived to see his countrymen spend 20 millions sterling in such a cause. He died 29th July 1833, and was buried as a national benefactor in Westminster Abbey. In 1797, W. married the daughter of Mr J. Spooner, the banker of Birmingham, by whom he had a large family. His third son, Samuel, is the present Bishop of Oxford. W. is the author of a *Practical View of Christianity*, which, on its publication in 1797, met with great success. In six months it went through five editions, and it has since been translated into most of the European languages.—See the *Life of Wilberforce*, by his Sons.

WILDBAD, a small town of Württemberg, in the Black Forest, romantically situated in a valley watered by the Enz, about 32 miles south-south-east of Karlsruhe, 18 miles of which are by railway to Pforzheim, and the remaining 14 by road, through a beautiful portion of the Black Forest. It is noted for its thermal springs and baths, the water of which ranges from 90° to 100° F. in temperature. The baths consist of numerous basins formed round the springs

as they gush from the rocks, and floored with sand for the comfort of the bathers. From the circumstance that these baths are natural, or *wild*, and not artificial, the town derives its name. The waters are nearly pure, the principal ingredient they contain being common salt. They are peculiarly beneficial for rheumatism, gout, stiffness of limbs, paralysis, &c., and for some skin-diseases. The season lasts from May till September, and the number of visitors has steadily increased from 470 in 1830 to 4782 in 1860. No gambling is allowed. Goitre abounds here and in the neighbouring close valleys of the Black Forest. Pop. 2008.

WILD-FOWL, a popular term, synonymous with *Water-fowl*, and generally applied to web-footed birds, but sometimes employed also to include herons, plovers, and other birds which frequent rivers, lakes, and sea-shores. The different kinds are noticed under their proper heads.—*Wild-fowling* is one of the most difficult, and yet one of the most interesting pursuits of the British sportsman. *Rock-fowling* (see **FOWLING**) is not included under this term. Wild-fowling is prosecuted in a great variety of ways. The wild-fowler seeks his game with a gun and dog, generally a retriever; or he uses a small boat, called a *punt*, adapted to the shallow waters in estuaries which wild-fowl frequent; or he proceeds a little further to sea, in a boat with sails; sometimes he employs a yacht, or he endeavours to

modern decoy-pipe, the birds, however, being generally driven, and not enticed into it. The *panthera* was a large purse or drag-net, placed along the banks of rivers. The ancient wild-fowlers sometimes practised a system of decoying, apparently less perfect than the modern system, but essentially of the same nature, enticing the birds to their snares by movements intended to excite their curiosity, and for this purpose the fowlers clothed themselves in feathered jerkins, and danced with peculiar motions and gestures. Nooses and bird-lime were also much employed in ancient times. The Egyptians made much use of the *throw-stick*, a missile similar to the boomerang of the Australians, and which was dexterously thrown so as to hit the neck of the bird. In more recent times, falconry was much practised for the capture of wild-fowl. The gun, decoys, and flight-ponds are now chiefly in use. Although many wild-fowl are killed with the ordinary fowling-piece, it is not thus that the greatest numbers are obtained. Much larger guns are used in punts and yachts, by which many are killed at one shot. The *stalking-horse* is still used in some parts of England, in order to enable the wild-fowler, armed with an ordinary fowling-piece, to get within reach of the birds, whilst they are feeding on the level swampy ground which they chiefly frequent. A horse well trained for the purpose advances towards them, the fowler concealing himself on the side of it furthest from them. An ox is sometimes trained for this use, and indeed the kind of animal with which the birds are most familiar in the locality is most suitable. Artificial stalking-horses are sometimes employed, made of canvas, and stuffed with straw, the head being down, as if grazing. This practice is common in some parts of France. The use of the stalking-horse is very ancient. Wild-fowl shooting is not unattended with danger. In the pursuit of wounded birds on the ooze, the sportsman or fowler must use *splashes*, thin boards about 18 inches square, attached to the feet, to prevent him from sinking; and if he fall, it is very difficult for him to regain his feet. He cannot raise himself by resting his hands on the mud, which only makes him sink deeper and deeper, nor can he do it by getting upon his knees. The only method is to roll over on the back, drawing the arms out of the mud, and placing one foot with his splasher firmly on the ooze, to press both hands on the knee of the leg so raised, and give a vigorous spring. The punter is also in great danger of losing himself in foggy weather when pursuing wounded birds, and being unable to get back to

Fig. 1.—Stalking-horse.

(From Blaine's *Encyclopædia of Rural Sports*. By kind permission of the publishers, Messrs Longman.)

approach his game on land by the aid of a *stalking-horse*; or he has recourse to decoys, and other contrivances, by which great numbers of wild-fowl are captured. It is chiefly on the eastern and south-eastern coasts of England that wild-fowl abound in Britain, and they are most abundant in severe winters, coming as migratory birds from the north; but the draining of the fen-lands has greatly reduced their numbers. The ancient Greeks and Romans captured wild-fowl by various kinds of nets, one of which, called the *argumentum*, was not unlike the

his punt, when a fearful death awaits him on the return of the tide.

The curly-coated retriever is the best dog for the wild-fowl shooter, but good training is necessary to fit the dog for his use. The punter ought not to carry a dog with him, because the dog, having no opportunity of exercise after his return from the water, soon suffers from the cold of the winter weather in which the sport is pursued.

Stedging for wild-fowl is practised by professional wild-fowl shooters on some parts of the English

coast, particularly that of Hampshire. The sledge traverses the oozes by means of a small light sledge called a *launching-punt*, with a gun in the fore-part. He pushes it ahead, crawling on his knees, and often at full length on the mud, till he gets within range. His most severe work is on sands and dry ground.

The *gunning-punt* is a small generally flat-bottomed boat, about 17 feet in length, with a gun placed in the front of it, generally carrying about half-a-pound of shot at a charge. The punt must be nicely trimmed, so that the gun is nearly on a level with the surface of the water; and the fowler, having approached the

birds where they are congregated, often kills great numbers by its discharge. The sport is pursued both by day and by night. The punt is generally constructed to carry only one person, and although he rows it in the ordinary manner till he discovers the birds, he is obliged then to lie down in the punt, and force it forward by a pole or by the oars with no little exertion, till he gets within range. The danger is not inconsiderable of his mistaking another punt in the darkness of night for an assemblage of wild-fowl, and firing at his fellow-sportsman. In a clear moonlight night he proceeds, if possible, against

Fig. 2.—Gunning-punt approaching Wild-fowl.
(By permission of Messrs Longman.)

the light, so that he may see, and not be seen. By a successful shot, great numbers of water-fowl are often killed. The punt-gun is capable of being *tipped*, that is, elevated so as to shoot water-fowl on the wing; and the most successful shots are often made by waiting till they rise, and tipping the gun. The punter cannot expect to recover all his wounded birds, and there are men on some parts of the coast who make their living during winter mostly by seeking for them in the morning.—The *sailing-punt* is a mere modification of the ordinary gunning-punt; the sail saving much hard work to the fowler, but its use is attended with greater danger, and it is utterly unsuitable for rough water. A *shooting-boat* is therefore sometimes used; but in it the gun cannot be fixed level with the surface of the water, as in the punt, and still more is this the case with the *shooting-yacht*. The practice of the sportsman is therefore considerably different, and the best shots are generally made after the birds are on the wing. The helmsman of the shooting-yacht must be quick and skilful in luffing up, in such a manner as to cross the flight of the birds, that they may be well exposed to the gun, which is generally larger than the punt-gun. Great numbers of wild geese, swans, &c., are often killed from the shooting-yacht. In approaching the birds, the greatest caution is necessary, and the men in the yacht must be carefully concealed behind the bulwarks.

Notwithstanding the draining of the fen-lands, many of the decoys of the eastern coast of England are still very valuable, and in some instances, they afford a considerable part of the living of the parochial clergy. A good decoy-pond attached to a rectory adds not a little to its value. It is in severe winters that the decoy-pond is most productive. It must be in a secluded situation, and the proprietor

takes care to keep it as secluded as possible, permitting no use of the gun or rifle in its neighbourhood. An extent of three or four acres is about the best for a decoy-pond. Very large ones are found to be comparatively much less productive. The decoy-pond ought to be surrounded with trees and copse; reeds and sedges being permitted to flourish near the water. Several *pipes* are led off from the pond,

Fig. 3.—Wild-duck or Mallard, Male and Female.

in different directions, ditches of six or eight inches in depth, of a curved form, and becoming narrower towards the extremity. It is in these pipes that the wild-fowl are caught, particularly mallards, teal, and widgeons, and often in very great numbers. The length of the pipe is generally from sixty to eighty yards, its breadth at the mouth from twenty

to thirty feet, diminishing to two feet at the extremity, where it terminates in a tunnel-net, generally carried out on the dry land. The whole pipe is spanned with a light netting, spread upon semi-circular bars of iron rod, in an arch of about twelve feet above the water at the entrance, but becoming lower as the pipe becomes more narrow. To attract wild-fowl to the pond, and to induce them to enter the pipe, *decoy-ducks* are kept, constant inhabitants of the pond, and regularly fed. Wild-fowl come more readily to the pond because of their presence, and follow them also to the mouth of the pipe, and into it, when they come at the well-known whistle of the decoy-man, to feed on the grain which he scatters for them on the water. It is only thus that the decoy-ducks are of use. They are not trained in any way, nor do they display any intelligence beyond response to the whistle which invites them to their food. Very different is the case with the decoyer's dog, the *piper*, so called not from any vocal powers, but from his use in enticing birds into the pipe. The dogs best adapted for this purpose are of a peculiar breed, small, fox-like, and very lively and frolicsome. They are very carefully trained, and their peculiar qualities seem to be in some measure hereditary. On the convex side of the curve of the pipe, for about thirty or forty yards, instead of netting coming down to the ground, screens made of reeds are placed of height sufficient to conceal the decoyer; but they are placed obliquely, with narrow outlets between them, through which his dog may pass, and with bars in

Fig. 4.—Wild-fowl Decoy-pipe.

the intervals about 18 inches high, for the dog to leap over. When the wild-fowl have been attracted to the mouth of the decoy, and the decoyer, peeping through the screens, perceives that they are in the proper situation, he sends out the dog, which makes sportive gambols in their sight, and they are attracted by the strange object, as sheep are when a small dog plays about in the field where they graze. They enter the pipe in pursuit, as if for gratification of their curiosity, and the dog leaps over the first leaping-bar, and disappears behind the screens, where his master immediately rewards him with a piece of cheese or other delicacy. When the wild-fowl have advanced a little further, the dog is sent out again, repeats his gambols, leaps over the second leaping-bar, and gets a second piece of cheese. The curiosity of the birds concerning the frolicsome little animal seems to increase, and by and by they are completely in the net, when they hurry on to be inevitably caught at the far end. The dog is trained to keep perfect silence. A single bark would disperse the birds. The success of the

decoyer depends very much on the state of the weather, and he must consider the direction of the wind in order to the choice of the pipe he is to use. Into such details, however, we cannot enter. It is in the daytime, and not by night, that wild-fowl are captured in the decoy. They generally leave the decoy-pond at night for neighbouring feeding-grounds. The decoyer often finds it profitable not to attempt the capture of birds when they first appear on the pond, but to wait for a few days, when they congregate in greater numbers.

Decoys are of so great value that many acts of parliament have been passed for their regulation and protection. A decoy which has been established for twenty years enjoys certain privileges secured by law, particularly as to the quietude of its vicinity, which must not be disturbed by the firing of guns at wild-fowl apparently going to the pond, even by the proprietors of land over which they pass.

Flight-ponds alone remain to be noticed. These are used chiefly for the capture of pochards or dun-birds, which very seldom enter the pipes of the decoyer. The same pond is sometimes used both as a decoy-pond and a flight-pond. The pochard, having its legs placed far back, cannot rise from the water so suddenly as the wild-duck or widgeon, and skims the surface for many yards, proceeding by a very gradual ascent. To capture flights of pochards, nets are used, which are fixed to a cumbersome apparatus of poles at the side of the pond. The pond may be about seventy or eighty yards square. On an embankment, about ten yards from the water,

strong posts are fixed, about twelve feet high, two together, and about fifty yards apart—the corners of the pond being generally occupied by trees. Further back, about fifty feet, are slighter posts, about fifteen feet high. Other posts are required for the working of the net, the position and use of which we cannot explain; but the purpose of the whole is that the net, which is of the form of a parallelogram, may be suddenly thrown up into the air. In order to this, it is attached to cross-bars, which work between the twin posts, and heavily-weighted boxes attached to two poles, aid in bringing it into an erect position when required. The fowler's skill relates very much to the moment of raising his net, which he does by drawing a bolt or trigger. The net ought to rise so as fully to confront the birds as they issue from the pond. Pens are formed on the embankment in front of the net of reed-screens about three feet

high, by two or three feet square, and the birds falling into them on being thrown back from the net, are caught, not being able to rise again. The number of pochards caught at once is sometimes very great. At Mersea and Goldhanger in Essex it has been necessary to employ a wagon and four horses to carry them away, and they have fallen in such heaps in the pens, that those below have been stifled by those above.—For full particulars concerning Wild-fowling, the reader is referred to Colonel Hawker's well-known work on *Shooting*, and to *The Wild-fowler* by Folkard.

Folkard, in his excellent work upon Wild-fowling, remarks that writers upon sporting literature generally apply correct terms to game and birds of the land, while water-fowl are invariably classed by them as 'flocks.' The modern terms, as applied to water-fowl, are, according to Folkard, as follows: 'A herd of swans. A gaggles of geese (when on the water). A skein of geese (when on wing). A paddling of ducks (when on the water). A team of wild-ducks (when flying in the air). A sord or

suit of mallards. A company of widgeon. A flight or rush of dunbirds. A spring of teal. A dopping of sheldrakes. A covert of oots. A herd of curlews. A sedge of herons. A wing or congregation of plovers. A desert of lapwings. A walk of snipes. A fling of oxbirds. A hill of ruffs. A small number of wild-fowl, as ducks and geese (about thirty or forty), is termed a "trip." The same of widgeon, dunbirds, or teal, is termed a "bunch;" and a smaller number (from ten to twenty) is called a "little knob." Of swans, it would be said, a "small herd;" and sometimes of geese, a "little gaggle," or a "small skein;" and so of ducks, a "short" or "long team."

WILD HUNT (Ger. *Wilde or Wühende Jagd*; also *Wildes or Wühendes Heer*, Wild or Maddening host; *Nachzügler*, Night Huntsman, &c.), the name given by the German people to a fancied noise sometimes heard in the air at night, as of a host of spirits rushing along over woods, fields, and villages, accompanied by the shouting of huntsmen and the baying of dogs. The stories of the Wild Huntsman are numerous and widespread: although varying in detail, they are uniform in the essential traits, and betray numerous connections with the myths of the ancient gods and heroes. The root of the whole notion is most easily discernible in the expression still used by the peasants of Lower Germany when they hear a howling in the air, 'Wode hunts' (*Wode jaget*), that is, Wodan or Odin marches, as of old, at the head of his battle-maidens, the Walkyries, and of the heroes of Walhalla; perhaps, too, accompanied by his wolves, which, according to the myth, along with his ravens, followed him, taking delight in strife, and pouncing upon the bodies of the fallen. The heathen gods were not entirely dislodged from the imagination of the people by Christianity, but they were banished from all friendly communication with men, and were degraded to ghosts and devils. Yet some of the divine features are still distinctly recognisable. As the celestial god Wodan, the lord of all atmospheric and weather phenomena, and consequently of storms, was conceived as mounted on horseback, clad with a broad-rimmed hat shading the face, and a wide dark cloak; the Wild Huntsman also appears on horseback, in hat and cloak, and is accompanied by a train of spirits, though of a different stamp—by the ghosts of drunkards, suicides, and other malefactors, who are often without heads, or otherwise shockingly mutilated. One constant trait of the stories shews how effectually the church had succeeded in giving a hellish character to this ghost of Wodan—when he comes to a cross road, he falls, and gets up on the other side. On very rare occasions, the Wild Huntsman shews kindness to the wanderer whom he meets; but generally he brings hurt or destruction, especially to any one rash enough to address him, or join in the hunting cry, which there are many narratives of persons in their cups having done. Whoever remains standing in the middle of the highway, or steps aside into a tilled field, or throws himself in silence on the earth, escapes the danger. In many districts, heroes of the older or of the more modern legends take the place of Odin; thus, in Lusatia and Orlagan, Berndietrich, that is, Dietrich of Bern; in Lower Hesse, Charles the Great; in England, King Arthur; in Denmark, King Waldemar. The legend has also in recent times attached itself to individual sportsmen, who, as a punishment for their immoderate addiction to sport, or for the cruelty they were guilty of in pursuing it, or for hunting on Sunday, were believed to have been condemned henceforth to follow the chase by night. In Lower Germany, there are many such stories current of one Hakkelberend, whose tomb even

is shewn in several places. Still, the very name leads back to the myth of Wodan, for Hakkelberend means literally the mantle-bearer (from O. H. Ger. *hakkul*; O. Norse, *hökull* or *hækla*; Ang.-Sax. *hacela*, drapery, mantle, armour; and *bera*, to bear). The appearing of the Wild Hunter is not fixed to any particular season, but it occurs frequently and most regularly in the twelve days between Christmas and Epiphany.

Another version of the Wild Hunt is to be found in the legend prevalent in Thuringia and the district of Mansfeld. There the procession, formed partly of children who had died unbaptised, and headed by Frau Holle or Holda (see BERCHTA), passed yearly through the country on Holy Thursday, and the assembled people waited its arrival, as if a mighty king were approaching. An old man, with white hair, the faithful Eckhart (see TANNHÄUSER and VENUSBERG), preceded the spirit-host, to warn the people out of the way, and even ordered some to go home, so that they might not come to hurt. This is the benign goddess, the wife of Wodan, who, appearing under various names, travels about through the country during the sacred time of the year. This host of Holda or Berchta also prefers the season about Epiphany. In one form or other, the legend of the Wild Hunt is spread over all German countries, and is found also in France, and even in Spain. In Lower Germany, it has been preserved in an older and purer form than in Upper Germany. It has probably some connection with Celtic mythology, but not apparently with the Slavonic.—See Grimm, *Deutsche Mythologie*.

WILFRID, SAINT, an Anglo-Saxon bishop, was born, of noble parents, in the kingdom of Bernicia in 634. He was remarkable when a boy for his good looks, graceful manners, and ability. He became at 14 the attendant on a Saxon nobleman, who had retired to spend the last years of his life in the monastery of Lindisfarne. There his attention was directed to the controversy as to the time of celebrating Easter (q. v.) existing between the two sections into which the Anglo-Saxon Christians were divided; the one advocating the Roman practice, which was that of the continental churches generally, the other adhering to the Sooto-British. W. resolved to visit Rome to ascertain which was in the right, and thither he went at the age of 19, with recommendations from the courts of Kent and Bernicia. He returned to England a warm partisan of the Roman party. From Alfrid, king of Northumbria, he received a grant of land and a monastery at Ripon, and there, in 664, he was ordained a priest. The synod of Whitby, which met in 664 to discuss the disputed questions between the two parties in the church, was attended by the most distinguished members of both, and among others, by Colman, Bishop of Lindisfarne, and Wilfrid. We have a curious account of this conference. The king presided, and seems at first to have been puzzled by the arguments, but he noticed that Colman always referred to St. Columba, W. to St. Peter—and it struck him that the relative power of these saints had a close connection with the points at issue. 'St. Peter,' said W., 'is the rock on which the Lord founded his church, and to him he intrusted the keys of heaven.' 'Did St. Columba not receive the same power?' asked the king. Colman could not say he had. 'Then you both admit that God has given the keys to St. Peter?' Both said they did. 'Well,' continued the king, 'if it is so, I shall not oppose him. Were I to do otherwise, I might find no one to open the gate when I came there; St. Peter might turn his back on me. We must not offend him.' The council and audience were carried

sway by this argument, and the king decided in favour of the Roman party. W. was afterwards named Bishop of York, but he did not enter into possession of his see until 669. He then surrounded himself with great pomp, built churches, one of which, at Hexham, was said to be the finest north of the Alps, and strove to oppose the ecclesiastical to the royal power. A quarrel followed with the new king of Northumbria, named Egfrid, and W. was deposed. He started on a journey to Rome, to make a personal appeal to the pope; but he was driven by a storm to the coast of Friesland, the inhabitants of which were still pagan. There, however, he was hospitably received by the king. To his arrival, the people attributed an excellent fishing-season and abundant harvest. He was asked to preach, and he did so in his own Anglo-Saxon tongue, which was perfectly intelligible to the Frisians. Such was the effect, that he baptised many thousands of the people, and all the princes. The event is one of the most memorable in the history of Northern Germany and Scandinavia, for with it began the conversion of these countries to Christianity by Anglo-Saxon missionaries, and the introduction into them of the arts and knowledge inherited from ancient civilisation (see BONIFACE; WILLIBROD). W. reached Rome, and the pope decided in his favour; but on his return to England, the king gave no heed to the decree, and committed him to prison. He escaped, however, to the Weald of Sussex, where he converted the pagan inhabitants. He was afterwards recalled to his see; and a proposal was made to elevate him to the primacy, but he was still opposed, as the leader of the Roman party, and ultimately he was deposed, and excommunicated. He again went to Rome, remained there some years, returned to England in 705, and died at Oundle, in Northamptonshire, in 709.—There is a very interesting sketch of the saint's life given in the 19th chapter of Bede's *Ecclesiastical History*. See also Lappenberg's *History of England under the Anglo-Saxons*.

WILHELMSHÖHE. See CASSEL.

WILKES, CHARLES, American naval officer and explorer, was born in New York in 1801, and entered the navy as midshipman in 1816, served in the Mediterranean in 1819—1820, and in the Pacific in 1821—1823, where he was selected for a separate command. In 1826 he gained the rank of lieutenant, and in 1830 was appointed to the *Dépôt of Charts and Instruments* at Washington, and was the first in the United States to set up fixed astronomical instruments and make observations. After being employed in surveying George's Bank, he was, in 1838, appointed to the command of an exploring expedition of five vessels and a storeship, in which he surveyed the Samoan group in the Pacific, discovered many islands and the antarctic continent, which he coasted through 70° of longitude, explored the Feejee group, and returned in 1842, when he was advanced to the grade of commander, and published a *Narrative of the United States Exploring Expedition* (5 vols. imp. 8vo, Philadelphia, 1845). Of the 11 supplementary quarto volumes, he was the author of the one on Meteorology; and in 1849, of a volume on California and Oregon, entitled *Western America*. In 1856, he published his *Theory of the Winds*. Having been promoted to the rank of captain in 1855, he, in 1861, took command of the United States steamer *San Jacinto*, and forcibly removed from the British mail-steamer, *Trent*, Messrs Mason and Slidell, commissioners of the Confederate States to England and France, and conveyed them to Boston, receiving the thanks of Congress and the acclamations of the people; but

at the demand of the British government, his act was disapproved, and the commissioners restored. In 1862, he was promoted to the rank of commodore, and to active service as acting-rear-admiral; but at the close of the war, placed upon the retired list of commodores.

WILKES, JOHN, a celebrated public character, was born in London, October 17, 1727. His father, a brewer or distiller at Clerkenwell, sent him when a lad to the university of Leyden, where he received an excellent education. On his return to England in 1749, he married a Miss Mead, an heiress, ten years his senior. His good manners, learning, ready wit, and open table secured him many friends, but extravagance and dissipation soon involved him in difficulties. He and his wife separated, and in a lawsuit which followed, facts came out most damaging to his character. He was nevertheless named High Sheriff of Buckinghamshire, and in 1757 returned to parliament as member for Aylesbury. In the House, he joined in the popular clamour against Lord Bute; and in June 1762, founded a paper entitled the *North Briton*, in which he denounced him with such vigour and success as to drive him from the ministry. He attacked with equal bitterness the next ministry, insinuating that although Mr Greville was nominally at the head of affairs, Lord Bute still had the ear of the king. In the 45th number of the *North Briton*, he charged the king with having uttered a falsehood from the throne, and in consequence, his house was entered, and his papers were seized. He was himself committed to the Tower, on a general warrant. But he was released by Chief-justice Pratt, on account of his privilege as a member of parliament. His paper was burned, by order of the House of Commons; but a riot ensued, shewing that public sympathy went with Wilkes. A prosecution was next instituted against the Under-secretary of State by W. for the illegal seizure of his papers; and he obtained £1000 of damages—a declaration being at the same time made by the Chief-justice that general warrants are illegal. W. then went to France, on the plea of bad health, and was expelled from the House of Commons. In his absence, he was convicted of having printed privately an obscene poem, of which he was one of the authors. It was hoped that evidence of his immoral character would disgust the public with him. But the copy of the book on which the prosecution had been founded had been obtained surreptitiously from a printer employed; and this fact becoming known, the steps taken by the government, instead of injuring W., only added to the outcry against ministers. On the formation of a new ministry under the Duke of Grafton, W. returned to England, and becoming a candidate for Middlesex, harangued great crowds in London. After his election, he was arrested, in consequence of his outlawry; and on the way to prison he was rescued by a mob. He, however, after it had dispersed, voluntarily gave himself up to justice. When parliament met, a crowd assembled to convey him to the House of Commons. A riot took place, and the military were ordered to fire on the mob in St George's Fields. Many persons were wounded, and one was killed. The coroner's jury who sat on the body returned a verdict of murder against the magistrate who had given the order to fire; and he was tried for that crime, but acquitted. W. secured a copy of a letter from Lord Weymouth to the chairman of the Lambeth Quarter Sessions, in which it was recommended that the military should be employed to suppress disturbances in London. It was published with a preface by W., in which he charged the Secretary of State with having planned 'the massacre in St George's Fields.' The House declared

the preface to contain a seditious libel, and W. was again expelled. He was after this re-elected several times as member for Middlesex; but the elections were declared void. Colonel Luttrell, who vacated his seat and opposed him, obtained only 300 votes; but he was declared to be duly elected, in defiance of a protest from the whole country. W., still in prison, was now recognised as the champion of public liberty, and became the most popular man in England. In 1769, he obtained a verdict against Lord Halifax in the Court of Common Pleas, with £4000 damages. He was shortly after discharged from prison on giving a bond for good behaviour during seven years. In 1774, he was chosen Lord Mayor of London, and again returned for Middlesex, which he continued to represent for many years. In 1782, the resolution by which he had been declared incapable of re-election was expunged from the minutes of the House of Commons, as subversive of constitutional rights. The other resolutions relating to W. were at the same time expunged. Two years later, he withdrew from the House of Commons. He died 27th of December 1797.

WILKIE, SIR DAVID, a distinguished Scottish painter, was born in Fifeshire, at Cultra, of which parish his father was minister, 18th November 1785. His boyish passion for art was too strong to be resisted by his father, who, with much reluctance, sent him, in 1799, to study in the Academy at Edinburgh. Here he greatly distinguished himself; and returning home, in 1804, he painted his 'Pitlessie Fair,' a piece in which already his peculiar genius is pronounced, and which brought him the sum of £25. The price seems paltry; but for the work of an unknown country stripling in an original walk of art, it was perhaps to be considered handsome. Shortly after, W. proceeded to London, intending to return to Scotland after a year or two of study; but the great success of his picture, 'The Village Politicians,' determined him to settle in the metropolis. Not that, pecuniarily, he was very greatly benefited, £30 being all that the Earl of Mansfield could with difficulty be got to pay for the picture, though aware that, on a point of honourable scruple, the artist had refused repeated offers of £100; but the originality and humour of the work greatly captivated the public, and at once established the reputation of the painter, who had soon commissions in plenty, at greatly advanced prices. In 1809, his brethren of the Royal Academy ratified the favourable verdict of the public by electing him an Associate; and two years afterwards, he was advanced to the rank of Academician. In 1814, in company with his friend Haydon, he visited Paris, and inspected with great delight the art-treasures at the Louvre. Though his father had died some years before, and his mother and sister were now living with him at Kensington, in 1817 he made a run into Scotland, and while the guest of Scott at Abbotsford, painted his well-known picture of the great poet and his family. During these years, W. had been engaged on the series of pictures on which mainly his fame rests; pictures familiar by engraving to every one (The 'Blind Fiddler,' 'Card Players,' 'Rent Day,' 'Jew's Harp,' 'Village Festival,' 'Blind Man's Buff,' 'Distraint for Rent,' 'The Penny Wedding,' 'Reading of the Will,' &c.), in which the homely humours of humble life are expressed by a vehicle appropriately simple, and—though scarce in the higher sense to be called colour—of charming purity and transparency. In this style, distinctively his own, his genius is commonly held to have culminated in 'The Chelsea Pensioners listening to the News of Waterloo,' which was painted during the years 1820—1821. This work was a commission from the Duke of

Wellington, who paid the artist 1200 guineas for it. Subsequently, he changed his style, sought to emulate the depth and richness of colouring of the old masters, and deserting the homely life, which he could treat so exquisitely, chose elevated, and even heroic subjects, to the height of which he could never rightly raise himself. The florid picture, painted in 1830, of 'George IV. entering Holyrood,' which, though not without its fine points, can delight no one but a flunkey, gave the first hint of the change; and no doubt a tour over nearly the whole continent, which he made for his health, in 1824, everywhere, of course, intent upon the grand old masterpieces, did something to stimulate the new and unwise ambition. By common consent, it has been adjudged unwise; and W. remains, and will remain, memorable, not for the quasi-high art of his later years, but for the simpler, truer, and, in every right sense, higher art of his earlier time. He never, however, ceased to be popular, and honours continued to be showered upon him. On the death of Sir Henry Raeburn, he succeeded him as Limner to His Majesty; in 1830, he was made Painter in Ordinary to His Majesty, in room of Sir Thomas Lawrence deceased; and in 1836, the honour of Knighthood was conferred upon him. W. had never been robust, and his health now began to give way seriously. In 1840, seeking to re-establish it, he once more left England; but he did not find what he sought. Having visited Syria, Palestine, and Egypt, he died on his voyage home, off Gibraltar, and his body was committed to the deep.

As an illustrator of Scottish character and manners in the humbler levels of life, W., in his best pictures, may take rank with Burns in his poetry, and Sir Walter Scott in his novels. As a man, he was kindly, warm-hearted, and—though with some touch of the canny Scot in him—of essential generosity of disposition.

WILL is, in English Law, a writing by which a person entitled to property declares what is to be done with such property after his death. Though, by the Wills Act, 1 Vict. c. 26, a writing is indispensable to a will, yet there is an exception in the case of soldiers or sailors who, from their occupation, and while in actual service, are allowed to make a verbal or nuncupative will; and this exception only extends to their personal estate, for they must make a written will, like other persons, in order to deal with their real estate. An infant, or person under 21 years of age, cannot, since 1838, make a will. A married woman can only make a will if she has separate property, or her husband assents to her will, or she makes the will by virtue of some power of appointment vested in her. As a general rule, it is absolutely necessary that the party making a will should have a free and disposing mind at the time; and hence, if he or she is a lunatic, or drunk, or acting under compulsion, fear, or undue influence, the will is invalid. There is no limit as to the time preceding death when a will may be made: it is enough that the testator was at the time capable and sensible, though he died immediately after. A will must be executed in presence of two witnesses, who see the testator sign the will, or at least hear him acknowledge it. But there is no particular form of words in which a will must be made for the purpose of disposing either of realty or personality. The will must be in writing, but it need not be in ink or written continuously. The testator may sign by his mark or by an assumed name. Though a seal is not equivalent to signature, yet a person may have a stamp to sign papers with, and that will be sufficient for a will also. The testator need not sign the will if he authorise some one to do so for him in his

presence. The signature must be at the foot or end of the will; but if it is placed so as to lead a court to the conclusion that it was intended to give effect to the will, that will be enough. Though the witnesses need not know it is a will, they must be present together when the testator signs it or acknowledges his signature. The witnesses must sign their names or make their marks. A legatee, or the wife or husband of a legatee, may be an attesting witness, but by being so, he or she will forfeit any legacy left to him or her by the will. But one may be an executor though he attests the will. A will is revoked by the marriage of the testator or testatrix. The mere fact of making a subsequent will does not of itself operate to revoke a prior will, unless there is some inconsistency in whole or in part; and, as a general rule, no will will be revoked by any presumption of an intention on the ground of an alteration in circumstances. The usual way of revoking a will is to burn, tear, or destroy it with the intention of revoking the same; or by executing another will which expressly revokes the prior will. When a testator tears or cuts away that portion of his will containing the signature and attestations, the presumption is that he intended to revoke the whole. But merely cutting out a part of the will, or striking it through with a pen, does not amount to a revocation. It is to be borne in mind that, in order to revoke by tearing, &c., there must be an intention to revoke, so that a mere accidental tearing will prevent the act from having the force of revocation. When there are interlineations or alterations in a will, it is presumed these are made after signature, unless there is evidence to prove the contrary. A will which is in any manner revoked can only be revived by re-execution, or by a codicil shewing an intention to revive it; but many nice questions have arisen as to what causes a will to revive.—In Scotland, a will is used only to denote a testament affecting personal or movable property; while a will affecting real or heritable property can only be made by way of a deed having a present operation. A will or testament may be written in the handwriting of the testator, and if signed by him, will not require witnesses, being then called a holograph will. In other respects, wills are subject to nearly the same rules which prevail in England with respect to revocation, &c. Wills of real property are called Dispositions or Deeds, and have a present operation, and the mode in which they are drawn up is that of conveying the property to the donee, but reserving the testator's life interest. The effect of this is that the testator retains the property in his own hands while he lives; but the moment he dies, the disposition *mortis causa* comes into play, and the donee then takes the property, subject to the deed. See DEED.

WILL. The Mind is divided into three distinct functions—Feeling (see EMOTION), Intellect or Thought (see INTELLECT), and Will or Volition. Under Will, is included the putting forth of active energy to move our own organs, or change something about us; but all energy is not voluntary energy. The peculiarity of action from Will, in contrast to other activities, as the powers of nature—wind, gravity, &c., is its being preceded or inspired by feelings, or by the pleasures and pains of an individual mind. Hence, Will is defined, *action prompted by feeling*. The feelings that prompt the will, called motives, are our pleasures and our pains; pleasure felt or imagined moves us to continue and increase the pleasurable state; pain urges us to work for the abatement of the pained condition.

In the maturity of the powers, a human being, or animal, can perform a great variety of specific actions at the bidding of the various wants or desires.

The sensation of thirst induces at once a series of complicated movements, ending in the relief of the painful feeling. But no man or animal is born with the ability to make a journey to a well, whenever thirst is felt; the human infant cannot even perform the voluntary act of lifting anything to its mouth. Our most ordinary voluntary movements are the result of an education; and the explanation of the volitional energies consists in ascertaining what are their beginnings or germs in the mental constitution, and how they are brought to the finished state.

Three different facts of our nature appear to concur in forming the collective aptitudes of the Will.

I. The fact termed Spontaneous Activity, or the self-acting energy of the system, whereby movements arise without waiting the stimulus of the senses. Any actively disposed animal, after rest and nourishment, begins to move merely through a surplus of nervous power, and not because it is wakened out of dormancy by the solicitations of sensible objects. Without this tendency to commence movements in the first instance, there would be no apparent basis for the voluntary acquirements. See SPONTANEITY. In imitation with the voice, for example, we must begin by uttering sounds, and then discover by the ear their agreement or disagreement with the sounds heard.

II. The second fact is the tendency to abide by a movement giving pleasure, and to relax a movement coincident with pain. From the first moments of sentient life, every animal appears to possess this property. If a movement happens to coincide with an access of pleasurable warmth, the animal maintains, and possibly increases, the movement: if the warmth passes into pain, the movement ceases. The infant sucks so long as the feeling is pleasurable, and ceases when satiety comes on. This power may be an offshoot of the general law connecting pleasure with an increase, and pain with a diminution of vital energy. See EMOTION. However arising, the fact is unquestionable, and is exemplified all through life. Without our going through any process of deliberation or resolution, we sustain an activity that brings us agreeable sensation, and remit an activity ending in pain. We keep our eyes fixed on a cheerful flame, and withdraw them when the glare is overpowering: the process is self-acting and intuitive.

III. The third fact is the operation of the Retentive power of the mind, in joining together, by a permanent association, movements and feelings that have existed together for some time. This is a branch of the great law of Contiguous Association. See ASSOCIATION OF IDEAS. The Will is an educated function, and education supposes the plastic or fixing operation expressed by the above-named law.

But the chief nicety in explaining the growth of the Will consists in shewing how the proper movements and feelings originally came together. This is the problem of the Development of Voluntary Power, which would demand an extended illustration. A brief indication of the process must suffice.

One of the easiest examples is the moving of the head to follow a light or other object pleasing to the gaze. This power is not possessed at the commencement of life, and the process of arriving at it is supposed to be as follows. The child has its eyes fixed on the light, and enjoys the luminous excitement. The light is moved to one side, and is therefore lost to the direct gaze, and there is no power to recover it. An accidental movement of the head, occurring by mere spontaneity, carries the eyes round to encounter the light again, or to follow it as it moves; the consequence is, that the recovered

pleasure of the spectacle sustains the movement that brings it. Now, every such coincidence tends to become fixed, by the law of plastic association; and after a few repetitions of the accidental concurrence, there is a connection formed between the optical impression and the movement that is found to go along with and sustain it. Thus it is, that a movement of the object to the right hand, which leaves a characteristic trace on the visual organ, becomes associated with a movement of the eyes and the head to the right hand; and whenever the optical fact arises, the movement is apt to follow. This makes one distinct item in our volitional acquisitions; one instance of the power of definitely acting to a definite feeling.

Another example might be taken from the feelings of warmth and chillness—both very powerful sensations in all animals. One of the most obvious means of attaining comfortable warmth is to crouch and bring all the limbs close to the body. A very early experience would connect this posture, accidentally hit upon, with the comfortable sensation; and, by virtue of the primary law of the mind, connecting pleasure with exalted energy, the movement, once coinciding with the pleasure, would be sustained and adhered to, so long as it brought the pleasure; and in course of a few repetitions, a definite association would be formed between the state of chillness and this mode of relieving it. By a more lengthened and round-about process, more complicated associations would be formed, such as coming close to the warm body of a companion, running into shelter, approaching a fire, going into the sunshine, &c.; but, in all cases, the only mode of attainment that can be pointed out, is (1) the concurrence of spontaneous movements with feelings of pleasure, or relief from pain; (2) the maintenance of those movements by the first law of self-conservation; and (3) the forming of a link between the two by the force of plastic association.

The illustration may be varied by viewing the case from the side of pain. The immediate and direct result of pain, from the dawn of sentient life, is to lower active energy for the time, and therefore to arrest whatever movements are in progress: this is the general rule, although there is an important exception in the case of acute or pungent pains, which, in the first stage, stimulate and excite the active members. Hence, when a movement happens to coincide with a pain, it is liable to be arrested; a bitter morsel in the mouth makes one cease chewing, by reducing the active power for the moment. The primitive endowment of the system would lead to nothing further, until some chance movement of the mouth tended to get rid of it, which movement would be promoted and sustained by the pleasurable feeling of relief, which is the operation of the principle from the other side.

The growth of the Will is conspicuously shewn in Imitation, which is an acquired aptitude, and a department of our voluntary power. In imitation, there must be (1) a spontaneous tendency to move the active organs concerned—the voice, the mouth, the hands, &c.; (2) a sense of the effect, with a certain pleasure in attaining it; and (3) a cementing process, as already described. In learning to speak, the infant must first articulate something of its own accord; the resulting sound affects its own ear, and is discovered to coincide with a sound heard from others. The frequent repetition of the articulate effort leads to its being coupled in the mind with the sound that it gives; and when this association is mature, the sound heard will induce the articulating movement; and this is the power of imitation. But previous to the opportunity of associating the exertion of the mouth, throat, and lungs

with the sound emitted, there does not appear to be any capability to imitate articulate sounds. The same would apply to imitation by the hands.

The Will in its full development includes not merely a series of associations of movements with the ordinary pleasures and pains, but also the power of performing actions to the word of Command, the Imitative faculty just discussed, and the power of acting from a mere Wish to perform a certain action, or to produce a certain effect upon things about us—as to open a window or stir the fire. It might be shewn that all these various aptitudes grow, by successive stages, out of the three fundamental facts above described. The process involves many struggles and failures, from there being so much in it depending on accidental commencements; hence one reason of the alowness of the early education of human beings.—See Bain on *The Emotions and the Will*. See also FREE-WILL.

WILLEMS, JAN FRANZ, a distinguished Flemish philologist and writer, and noted as one of the originators of the great Flemish national movement, was born, in 1793, at the little village of Bouchout, near Antwerp. W., at the age of twelve, was sent to the town of Lierre, to learn singing and music, for which he had early evinced considerable aptitude. At Lierre, which continued to be the seat of some of those ancient Belgian literary associations known as 'Réderyk-Kamers,' or Chambers of Rhetoric, mysteries and other scenic representations were given from time to time in connection with these institutions; and during W.'s residence in the town he was frequently called upon to take part in these singular entertainments, a circumstance to which he ascribed his first impulse towards the study and cultivation of the old Flemish language and literature. The talents which he exhibited in his acting, and in the composition of satirical verses, attracted the notice of several influential persons at Lierre, through whose agency he was sent to Antwerp, to study in the office of a notary; and in 1811, he contended successfully for the prize awarded for the best poem on the battle of Friedland and the peace of Tilsit. From this period, his poetical and dramatic compositions followed each other in rapid succession. His ode *Aen de Belgen* (To the Belgians), which appeared in 1818, in which he exhorted his countrymen to resume the use of their native Flemish, and his clever treatise on *De Nederduytsche Taal en Letterkunde* (1819—1824), in which he traced the history of the Flemish and Dutch tongues from their common origin to their gradual but slight divergencies, marks an epoch in the literary history of Belgium. The Dutch government shewed their sense of his anti-French tendencies by giving him the post of Keeper of the Archives at Antwerp, while the Royal Institute at Amsterdam elected him a member of its learned corporation; but the Catholic party in Belgium resenting the attempt made by W. to refer the decline of Belgian national renown to the abandonment of the Flemish vernacular, looked upon his writings with mistrust; and in 1830, when Belgium was definitely separated from Holland, the dominant Belgian party deprived W. of his office, and left him for a time in obscurity and neglect. In 1835, chiefly through the influence of his old opponent, S. Van de Weyer, he was, however, promoted to the place of Keeper of the Archives at Ghent, where he continued to reside in the enjoyment of numerous literary successes and national honours, till the period of his death, which took place in 1846. W. had the satisfaction, during the latter years of his life, of seeing the gradual growth of the Flemish movement, which, since his death, has continued to advance with steady progress,

and has resulted in the formation of many literary societies, the publication of numerous literary and historical remains of the old Flemish, and a more general cultivation of the vernacular. Among the numerous Flemish works published by W., special notice is due to his version of the mediæval poem of *Reineke Vos*, or *Reynard the Fox*, for which he claims a Flemish origin; while, among the more important of his strictly national works, we may instance his editions of the rhymed chronicles of Jan de Klerk and Jan van Heelu, and his *Mengelingen van Vaderlandschen Inhoud*.

WILLEMSTAD, a fortified town in North Brabant, on the Hollandsdiep, 16 miles north-west of Breda, erected by William I., Prince of Orange, to protect the traffic between Holland and Zeeland. There are 7 bastions, 2 forts, 2 inundation sluices, and a good haven. Pop. 1860. In 1793, Baron van Boetzelaar successfully defended W. against the French, under Dumouriez, who, after a heavy bombardment, were obliged to break up the siege. It was the birthplace of the naval hero, Callenberg, who, when De Ruyter fell in action with the French, succeeded to the command.

WILLEMSTADT, chief town of the island of Curaçao (q. v.).

WILLET (*Symphemia semipalmata*), a bird of the family *Scolopacidae*, a native both of North and South America. It is about fifteen inches long; dark ash-colour above; the rump, upper tail coverts, and under parts white, the tail grayish, the tail-feathers, all except the two middle feathers, spotted with dark-grayish brown; the secondaries of the wings white, with dark-brown spots. The bill is two inches and a half in length, very thick, compressed; the wings long; the legs long and strong, the tail short and nearly square; the toes partially webbed. This bird is found in summer as far north as the coasts of New England; in winter, it retreats to the Gulf States. The flesh is highly esteemed, and the eggs are reckoned a delicacy. Willets are usually seen in flocks, and generally near the sea. The name is derived from the note.

WILLIAM I., king of England, commonly called *William the Conqueror*, was the illegitimate son of Robert, surnamed *Le Diable*, Duke of Normandy. He was born in 1027, and succeeded to the dukedom on the death of his father, in 1035. Previous to his father's death, he had been intrusted to the care of Henry I. of France; but it was owing rather to the quarrels and jealousies of his own subjects than to the protection of Henry, that he was able to preserve his dominion intact until his arrival at manhood. In 1047, he gained a victory at Val de Dunes over a powerful competitor, Guido of Macon; and in 1054, he defeated another rival, Guillaume, Count of Arques, being aided in both contests by the French. His ambition now began to extend to England, where Edward the Confessor reigned at this time. On visiting England, W. found his hopes of succeeding Edward much strengthened by the dominance of Norman influence in the councils of that monarch. On Edward's death, however, the Witenagemôte (q. v.) chose Harold (q. v.) to fill the English throne; ignoring, according to the monkish chroniclers of Norman bias, in so doing, an alleged bequest of Edward in favour of William. The Norman asserted his pretended rights by a powerful invasion, and the result was his acquisition of the crown by the famous battle of Hastings, October 14, 1066. Harold having been killed in the fight, the Saxons chose Edgar Atheling as his successor. Edgar was, however, soon obliged to yield, and W. was crowned king of England,

December 25, 1066; from which day his reign is dated. Edgar remained for some time at his court, and his treatment of the conquered people was at first mild and conciliatory; but his savage suppression of a rebellion, which broke out in the north in 1070, laid the foundation of an irreconcilable antipathy between Saxon and Norman, which rendered a continuance of this policy impossible. Before long, W. began to rule like a true conqueror. Everywhere, the Saxons were reduced almost to a state of slavery. The higher classes were deprived of every office of church and state, while the people were ground down by new and oppressive taxes. Fortresses were erected over the country, and garrisoned, to overawe the Saxon inhabitants. In 1072, the Saxons were so far reduced to submission, that W. found time to lead an army across the border into Scotland, in order to punish the king of that country, Malcolm Canmore, for having received and protected Edgar Atheling. The Conqueror marched as far north as the Tay, and received a nominal submission from Malcolm. In 1085, an attempt was made to overturn the power of the English king by Canute, king of Denmark. A great naval armament was got together for the purpose of invasion, but the enterprise was abandoned, its abandonment being caused partly by bad luck, and partly, it is supposed, by a skilful application of W.'s treasure. The tax called the *Danegelt* (q. v.) was re-imposed to meet the expense caused by the threatened war. Disputes having arisen between W. and his son Robert respecting the duchy of Maine, which had come to W. through his marriage, November 2, 1053, with Matilda, daughter of Baldwin, 5th Earl of Flanders, father and son took up arms against one another. The dispute was ultimately adjusted, through the intercession of Queen Matilda. Most of the latter part of W.'s life was spent in Normandy, the government of England being entrusted mainly to his half-brother, Odo, bishop of Bayeux. W. was of a corpulent habit of body, at which fact it seems that his brother-monarch, Philip I. of France, had pointed some sarcasm. W., in a fit of wrath, raised an army, and invaded France. He took the city of Mantes, and set it on fire; but while in full enjoyment of the blaze, his horse, stumbling on some hot embers, threw him, and the injury he received proved fatal. He died September 9, 1087. Stern and ruthless as W. undoubtedly was, he yet knew how to govern a nation and protect it from foreign aggressions. For more than two centuries England had been harassed by the frequent descents of piratical hordes. He put an end to these. Never after W.'s time did a Norse rover venture to shew face on the English coast. In the common administration of justice, he was royally impartial; many of his severities are even referrible in part to his thorough hatred of anarchy, while his attitude towards the church is admirable. He clearly defined the limits of ecclesiastical judicature, and when the formidable Hildebrand desired that the conqueror should do homage to him for the kingdom of England, the latter boldly refused.

WILLIAM II., king of England, surnamed *Rufus*, second son of William the Conqueror, was born in Normandy in 1056. He was educated by the celebrated Lanfranc, Archbishop of Canterbury. He was the favourite son of his father, who, on his deathbed, recommended him to the barons and prelates as his successor to the crown of England. W. was, at the time of his father's death, along with him in Normandy. But no sooner had the event taken place than he set out for England. Landing at Dover, he obtained possession of its castle and of several other fortresses. He then presented

himself to Lanfranc, who proposed him to the nobles and prelates as their king. No opposition was offered, and W. was crowned on September 26, 1067. Meanwhile, his elder brother, Robert, had entered upon possession of the duchy of Normandy. The relative position of the brothers was such as, in these times, was sure to lead to war between them. Robert, at the instigation of Odo, Bishop of Bayeux, endeavoured to excite an insurrection in England. This attempt having failed, W., in revenge, invaded Normandy in January 1091. An arrangement having been ultimately come to through the mediation of Philip I. of France, Robert and W. then turned their united arms against their third brother, Henry, who had purchased from Robert the district of Cotentin, comprising nearly one-third of Normandy. The fortune of war went against Henry, who was driven into exile. Returning to England, W.'s next enterprise was an invasion of Scotland. The life of W. seems to have been a continual scene of strife. Returning from Scotland, he felt himself called upon to renew the contest with his brother, who had, meanwhile, strengthened himself by an alliance with Philip of France. A pecuniary payment, however, by W. to Philip soon dissolved the bond between him and Robert. W. would now, doubtless, have taken signal vengeance on his brother, had he not been recalled to England by disturbances in Wales and in the north. In the year 1096, Robert, having resolved to go to Palestine, sold his duchy of Normandy to W., for £10,000. This transaction led to a contest between W. and a chieftain named Helie de la Flèche, who had all along disputed Robert's right to the Maine district of Normandy. Helie was not, however, able to withstand the English monarch, who now took the field against him. He was obliged to disband his forces and take to flight. This was the last warlike achievement of William Rufus. He was shot (it is said, accidentally, though there appears equally good reason to believe the act intentional) by an arrow, supposed to come from the bow of Sir Walter Tyrrel, while hunting in the New Forest, on August 2, 1100. His body was found by a poor charcoal-burner, who conveyed it in a cart to Winchester. W. inherited the courage, energy, and political talent of his father, but he was ruthless and unprincipled.

WILLIAM III., king of England, was the posthumous son of William II. of Orange, and Mary, eldest daughter of Charles I. of England. He was born in 1650. The alliance of his family with the Stuarts excited the jealousy of Oliver Cromwell, and by his influence, the young prince and his descendants were declared to be excluded from the Stadtholdership of the United Provinces. W. 'found himself,' says Macaulay, 'when first his mind began to open, the chief of a great but depressed and disheartened party, and the heir to vast and indefinite pretensions, which excited the dread and aversion of the oligarchy, then supreme in the United Provinces.' The restoration of the Stuarts, however, in England greatly improved his prospects; and on the murder of De Witt, W., then in his 22d year, was chosen Stadtholder. The republic was at this time carrying on an apparently hopeless war with its powerful neighbour, Louis XIV. of France; but by the wisdom and determination of the young Stadtholder, the contest, which lasted for nearly seven years, was in 1678 terminated by the treaty of Nimeguen, in a manner highly advantageous and honourable for the United Provinces. A few years before, their ruin had seemed inevitable; and the fame of W. became great over Europe. Shortly before this event, he had married his cousin, the Princess Mary, eldest daughter of the

Duke of York, afterwards James II. of England. This marriage, entered into solely from political considerations, did not at first prove a happy one. W. seems to have been jealous of his wife's position, and too reserved to give utterance to his feelings. According to Macaulay, a complete explanation and reconciliation were ultimately brought about by the agency of Bishop Burnet.

In 1686, W. became the head of a league formed among the Protestant princes of Germany, the kings of Spain, Sweden, and others, having for its object to curb the power of Louis XIV. The treaty by which the alliance was constituted was signed at Augsburg in July 1686. In England, the tyranny of James II. was now beginning to estrange from him the affections of every class of his subjects. The eyes of all were turning towards the Stadtholder as their only hope. Having formed his resolution, W. conducted his operations with great secrecy and skill. On the 5th November 1688, he landed at Torbay, with an army of 15,000, composed of English and Dutch. His success was rapid and bloodless. Men of influence of all parties gave him their presence and support; and on the 18th of December following, he entered London triumphantly as a national deliverer. The adherents of James held out for some time in Scotland and Ireland; but the death of Dundee ended their resistance in the former country; while in the latter it was ended in 1691, after a vigorous contest of two years, in which the Stuart party had, in most cases, the advantage. The object of W., in accepting the crown of England, was probably not so much to free the English nation from the tyranny of James, as to enlist its power on his side against that of France. In spite of his sterling qualities, and of the debt which they owed to him, the English nation never really liked William III. The death of his wife, on whom the crown had been conferred jointly with himself, in 1695, materially injured his position. His schemes were thwarted by parliament; continual plots for his assassination were hatched by the adherents of James; and in his warfare with France, victory was almost always on the side of Louis, W. being in person repeatedly defeated by Luxembourg (q. v.); and it was not without a struggle and a pang that he agreed to the terms of the peace, eminently popular, however, which was concluded at Ryswick on 10th September 1697. The death of Charles II. of Spain in 1700, and the succession of Philip of Anjou, was another blow to his policy. He carried it on, however, with unflagging vigour till his death, which was occasioned by a fall from his horse, on 8th March 1702. The massacre of the Macdonalds of Glencoe (q. v.), and his conduct to the promoters of the Darien Scheme (q. v.), are two blot on W.'s reputation which his most thoroughgoing apologists have been unable to efface. However, he was undoubtedly a practical genius of the highest order, and the services which he rendered both to England and to his native country can hardly be overrated. During his reign the Bank of England had been founded, the modern system of finance introduced, ministerial responsibility recognised, the liberty of the press secured, and the British constitution established on a firm basis. In his domestic life, he committed the error of a too stern repression of all manifestation of kindly or genial feeling. His manner was wholly Dutch, and even his countrymen thought him blunt. 'In his intercourse with the world in general,' says Lord Macaulay, 'he appeared ignorant or negligent of those arts which double the value of a favour, and take away the sting of a refusal.'—See Macaulay's *History of England*.

WILLIAM IV., king of Great Britain and Ireland, third son of George III., was born on 21st August 1765. Until 1771, he remained, along with the Prince of Wales and Prince Frederick, under the care of Dr Majendie. He was then sent to Kew, where, with Prince Edward, afterwards Duke of Kent, he was under the guardianship of Colonel Bude. On 15th June 1779, he entered the navy as midshipman on board the *Prince George*, then under Rear-admiral Digby. The *Prince George* then joined Admiral Rodney's squadron, on its way to Gibraltar. After seeing a considerable amount of service, Prince W. was made a lieutenant on 17th June 1785; and in the year following, he received his commission as captain. In 1789, he was created Duke of Clarence and St Andrews, and Earl of Munster, with an allowance from parliament of £12,000 a year. Subsequent to this, several acts of insubordination rendered an actual continuance of his professional career impossible. He was, however, formally promoted through the successive ranks until he was made Admiral of the Fleet in 1801. Meanwhile, however, he had been living almost entirely ashore, along with Mrs Jordan, a celebrated actress, with whom he had become connected in 1791. By her he had a family of five sons and five daughters who became known by the surname Fitzclarence, and were raised to titular dignities. On 11th July 1818, he married Adelaide, eldest daughter of the Duke of Saxe-Meiningen. The issue of this marriage was two daughters, both of whom died in infancy. By the death of the Duke of York in 1827, the Duke of Clarence became heir-presumptive to the throne, to which he succeeded, on the death of his brother, George IV., on 26th June 1830.

The great event of the reign of W. IV. was the passing of the Reform Bill. After a fierce and protracted struggle, the bill was read a third time in the House of Lords on 4th June 1832, and three days afterwards it received the royal assent. The first Reformed parliament met on 29th January 1833. The abolition of colonial slavery, the reform of the poor-laws, and of the Irish church, were the immediate results of the great constitutional change. King W. died, after a short illness, on 20th June 1837. He was succeeded by his niece, Queen Victoria.

WILLIAM THE LYON, one of the early kings of Scotland, succeeded his brother, Malcolm IV., in 1165. He is commonly called W. the Lion, but why he obtained that title is one of the mysteries of history. When heraldry long afterwards became a science, and was supposed to have been in use earlier than it really was, it was not unnaturally supposed that he was the first king who used, as a heraldic achievement, the lion, afterwards the chief feature in the arms of Scotland. His predecessors had long contested with the kings of England the sovereignty of Northumberland and other districts of what is now the north of England. Under Malcolm, these claims were virtually abandoned, and the king of Scots received, as a sort of equivalent for them, the earldom of Huntingdon and other valuable estates holding of the English crown. William had still, however, a hankering after the Northumbrian districts. He attended Henry of England in his continental wars, and is supposed, when doing so, to have pressed for a portion at least of the old disputed districts. In his disappointment, he invaded them, after the example of his ancestors. On the 13th July 1174, he fell, almost by accident, into the hands of an English party. For security, he was conveyed to Normandy, and there he consented, as the price of his liberation, to perform that homage for his kingdom which the English kings so long in vain attempted to exact

from the government of Scotland. How far the Scots community would have admitted that he had a right to bind them to such a condition, may be doubted. The treaty of Falaise, however, as the transaction was termed, from the place where it was adjusted, was revoked in the year 1189 by Richard I. of England, in consideration of a payment of 10,000 marks, which he wanted for his celebrated expedition to Palestine. W. had several disputes with the church, but he was one of the early benefactors of the regular ecclesiastics, and founded, in 1178, the great abbey of Arbroath, which he dedicated to Thomas à Becket, who had been slain eight years earlier. King W. died in 1214.

WILLIAM, PRINCE OF ORANGE, and COUNT OF NASSAU, the founder of the independence of the Netherlands, was born at Dillenburg, April 16, 1533. His father, William, was the second son of Count John of Nassau-Dillenburg, and succeeded to the German possessions of the family; while his elder brother, Henry, obtained the extensive estates in Luxemburg, Brabant, Flanders, and Holland. The latter also by his marriage with Claudie of Chalons, added the charming and valuable little principality of Orange to his already extensive domains; but his son René dying without issue, left Orange along with the Low Countries' estates to W., in 1544. W. had hitherto lived at Dillenburg under the care of his father, who was a zealous Lutheran; but on his becoming the most powerful lord of the Low Countries, he was sent to the Queen Regent's court at Brussels, and brought up in the Catholic faith. At the age of 15, he became page to the Emperor Charles V., who took an almost paternal care of him, attentively watched the development of his character, and, satisfied with the result, took him into his inmost confidence, making him the safe repository of the most important secrets, employed him in various diplomatic offices, and in 1555, promoted him, over the heads of all his veteran officers, to the command of the imperial army on the French frontier. In all these various situations, W. acquitted himself completely to his patron's satisfaction; displaying acute intelligence, sound judgment, and a precocious knowledge of men, while bearing himself with a grace and dignity of manner that gained universal esteem. Charles, on his abdication, strongly recommended W. to his son Philip as a confidential adviser; and accordingly, we find him employed to draw up the treaty of Cateau-Cambresis, and selected as one of the four hostages to be given to France for its fulfilment. During W.'s residence in France, he was confidentially informed by Henry II. of a secret arrangement which was being formed between France and Spain for the complete extermination of heretics in both countries; and with admirable nerve, dissembling his horror of the project, he resolved in his own mind to oppose the execution of the scheme in the Netherlands to the uttermost of his power. On returning to the Low Countries, he became the leader of the party which devoted itself to the maintenance of the chartered liberties of the country, agitated for the recall of the Spanish troops, opposed the augmentation of the number of bishoprics (a pet scheme of Philip's, for his opposition to which he first incurred the bitter dislike of his sovereign), and finally broke entirely with Cardinal Granvelle, the president of the council, and the willing agent of Philip's tyranny. Expostulations to the Regent Margaret of Parma, and directly to Philip himself, far from producing any good result, seemed only to hurry the bigoted monarch to more extreme measures; the cruel edicts against heretics were made still more stringent, and at the end of 1564, the inquisition was established. W., how-

ever, steadily refused to allow these oppressive enactments to take effect in his hereditary governments of Holland and Zeeland; and though he did not join in the famous protest known as the 'Compromiss' which was presented to the regent by the 'Beggars,' he supported their proposals at court, seeing that, though maintained with somewhat too much violence, their aims were the same as his own. For the next few years, he was unremitting in his exertions to impress both the rulers and the people with the desirableness of moderation, and on several occasions succeeded by his personal influence in repressing religious dissension. Hitherto, he had laboured conjointly with Counts Hoorn and Egmont, but failing to convince his two associates of the rank duplicity of the king, of which he himself was assured by means of the spies in his pay at the Spanish court, and of his perfidious designs against them, he was compelled to leave them to their fate, and retired to his German estates. Hoorn and Egmont were seized and executed; W., cited as a rebel (January 1568), and, on the ground of being a knight of the Golden Fleece and a sovereign prince, refusing to appear, had his estates confiscated, and the Duke of Alva arrived at Brussels, to reduce the provinces to submission. W. had hitherto lived in a most luxurious and extravagant manner, the splendour of his household far exceeding that of his royal master; but now he effected a thorough retrenchment, and disposed of his valuables, to equip four armies for the invasion of the Low Countries. Two of the armies failed completely; the third, under his chivalrous brother Louis, was destroyed at Jemmingen by Alva; and the fourth, 30,000 strong, under his own immediate command, lay in Brabant, unable to force Alva's army to a conflict, till want of the means of paying his soldiers forced him to retreat. His next attempt was made in 1572, and though as unsuccessful on land as before, he succeeded in exciting Holland, Zeeland, Gelders, Overijssel, and the bishopric of Utrecht, to rise for their liberties; and was proclaimed by these provinces as their stadtholder for the king, whose authority he and they still acknowledged. Meantime, his coadjutors, the 'Beggars of the Sea,' had taken Brill and Flushing, and had committed heavy depredations on Spanish commerce. But ere long the fortune of the Spaniards on land was again in the ascendant; fortress after fortress fell into their hands, despite W.'s utmost efforts to relieve them; and though Holland and Zeeland still remained faithful to the cause of liberty, he found it impossible to raise an army which could fairly cope with the enemy. He succeeded, however, by breaking the dykes, in saving Leyden, though Antwerp and Haarlem experienced all the horrors of a siege and capture. It was at this period that W. openly professed himself a Calvinist, though, with his usual moderation, he utterly disclaimed the bigoted fanaticism which characterised his co-religionists, and in which they went near to equal their adversaries the Catholics. Success still attended the patriot fleet, and though the gallant Louis, with his brother Henry, was defeated and slain at Mooker-Heide (14th April 1574), the ruinous condition of the Spanish finances, and the general detestation in which the soldiers of Philip were justly held, helped W. to hold his ground. In March 1575, conferences were opened at Breda between the belligerents, but Philip obstinately refusing to yield an iota, they were broken off; and in October of that year, the provinces of Holland and Zeeland pronounced Philip's deposition, and gave power to W. to choose the country under whose protectorate they were to be placed. Meantime,

the rapacity of the Spanish soldiery had roused the fifteen provinces which still remained loyal to Philip, and the league, known as the *Pacification of Ghent* (October 1576), the object of which was to drive out the foreign troops, and establish, at least for a time, toleration in religion, was the consequence. This was a brilliant success for W.; and though Don John of Austria, the new governor, tried to dissolve it by the 'Perpetual Edict' (12th February 1577), in which he granted nearly all demands, W. succeeded, by skilful policy, in foiling the attempt. War was accordingly resumed, and the patriots were defeated at Gembloux (31st January 1578), though their spirits were from time to time buoyed up by an occasional success. The next governor, Alexander Farnese, succeeded, however, in detaching the Walloon provinces from the league, though, to compensate for this, W. obtained the signature of the *Union of Utrecht* (23d January 1579), the first foundation of the Dutch Republic. In the following year, his two faithful provinces, Holland and Zeeland, after having been nominally under the sway of the Archduke Matthias of Austria, and of the Duke of Anjou, proclaimed W. their sole ruler, the Duke of Anjou being still acknowledged as sovereign of the others. W., however, after his long and desperate struggle for his country's freedom, was not destined long to enjoy the honours of sovereignty, for, on 15th March 1580, Philip had, by Granville's advice, put a price of 25,000 gold crowns on his head, and the incitement of this magnificent bribe produced various attempts to assassinate him, the last of which, by Balthasar Gerard, was successful at Delft, 10th July 1584. W. was four times married, and left by his first wife, Anne of Egmont, Philip-William, Prince of Orange; by his second, Anne of Saxony, the famous Maurice (q. v.); and by his fourth, Louise de Coligny, Frederick-Henry, who succeeded Maurice as stadtholder of Holland.

WILLIAM I. (Ger. **FRIEDRICH-LUDWIG WILHELM**), the present king of Prussia, is the second son of Frederick-William III., and was born 22d March 1797. He received a careful education, joined the army at an early age, and was engaged in the campaigns of 1813—1814 against France. On the accession of his elder brother, Frederick-William IV. (q. v.), to the throne in 1840, W. became governor of Pomerania, and afterwards sat in the Prussian diet, and vigorously supported the absolutist party. In consequence, he was so much disliked by the people, that on the outbreak of the revolution of 1848 he had to flee to England; though he returned some months after, and was elected to the National Assembly. However, from this time he interfered little in the quarrels between the Constitutionalists and Absolutists, though he gladly accepted the command of the troops despatched to put down the rising in Baden; and in October 1857, the king having become incapacitated for business, W. was commissioned to act as regent, a commission renewed from time to time till his permanent installation in October 1858. At this time he was very popular in Prussia, owing to his supposed opposition to some of the obnoxious measures of the king's ministers, and to his vigorous advocacy of conjoint action with Britain and France in the war of 1854; and his election as regent was consequently opposed by the aristocratic and pietistic parties, who were, on his elevation, dismissed from power, and a more liberal ministry formed. On January 2, 1861, W. ascended the throne; and on the occasion of his coronation at Königsberg on 18th October following, he himself put the crown on his head, declaring that he 'ruled by the favour of God, and of no one else.' The

result of the elections to the Chamber of Deputies, which were being carried on at the same time, being much in favour of the liberal party, W., who was quite astonished at the fact of the party whom he looked upon as the opponents of the crown having a majority, attributed it to the intrigues of secret enemies; and in his address at the opening of the Chambers, saying that he 'never could permit the progressive development of our inner political life to question or to endanger the rights of the crown and the power of Prussia,' disclosed the principle of his policy, a policy which, with all the unflagging perseverance and unconquerable obstinacy which characterise men, like him, of thorough honesty, unflinching firmness, and considerable narrow-mindedness, he has since unremittingly pursued. The first chamber which sat after his coronation was dissolved, despite the protest of a large majority of the members; but the succeeding elections further increased the liberal majority; and though some popular measures were brought forward, and some obnoxious taxes abolished, the new chamber proved as refractory as its predecessor, and refused its consent to the extensive changes in the Prussian military system (the king's pet scheme), and to the raising of money by loan, to be applied for that and other ministerial projects, till its constitutional powers were fully acknowledged. On September 22, 1862, Herr von Bismark-Schönhausen, formerly the ambassador at Paris, was made prime minister; and the deputies having not only rejected the ministerial budget, but resolved that the expenditure of moneys not sanctioned by them was a breach of the constitution, the chamber was dissolved, October 14, the king declaring by message, that as the three estates could not agree, he should continue to do his duty to his people, without regard to 'these pieces of paper called constitutions,' in which he had no faith. The number of the liberals was further increased in the following year, and the contest continued; the deputies displaying the same firmness and extreme moderation as before; while the king and his ministers made it plainly understood, that if the lower chamber did what the government asked it to do, all would be well; but if not, the king would 'do his duty' without its aid. However, this strife between the old feudal and the modern liberal doctrines was shelved at the close of 1863, by the able strategy of Bismark, who revived the old dispute with Denmark regarding its government of Slesvig and Holstein, and by forcing Austria to conjoint action, contrived to make the question one of 'German' interest. See SLESVIG. This quarrel being temporarily settled, the attention of the chamber was diverted from home affairs by the dissensions between the two governments as to the disposal of the territories taken from Denmark, by the war (see GERMANY in SUPPLEMENT) between Prussia and Austria, and by the subsequent arrangements for the consolidation of the extended monarchy. The intense national feeling of the Prussians has, on account of the astonishing success of his foreign policy, given an immense popularity to the king and his government; but with a continuance of external tranquillity, the political contest between him and his people cannot fail to be renewed. W. married, 11th June 1829, Maria Louisa of Saxe-Weimar, by whom he has issue Friedrich-Wilhelm, the Crown Prince of Prussia, who married Victoria, the Princess-royal of England, and has issue; and Louisa, the present Grand-duchess of Baden.

WILLIAM II. (FREDERICK GEORGE LEWIS), King of the Netherlands, Grand Duke of Luxembourg, Duke of Limburg, &c. (1840—1849), son of William I., was born at the Hague, 6th December

1792. In 1795, the Orange family sought an asylum in England, whence a few years later, the hereditary Prince of Orange-Nassau, afterwards William I., king of the Netherlands, went to settle at Berlin, where his son attended the Military School. At the age of 17, he was sent to study at Oxford; and in 1811, joined the army in Portugal, and served on the staff of Lord Wellington, to whom he became adjutant, and speedily obtained the rank of colonel. His bravery was conspicuous at Fuentes de Onore and Ciudad Rodrigo. At Badajoz, the storming column having been repulsed, the young prince met and rallied the retiring troops, leading them anew to the attack, and was the first to spring into the breach. He took an active part at Salamanca, Vittoria, and the battles of the Pyrenees. On the return of the Orange family to the Netherlands, William I. made him commander of the army. The last campaign of Napoleon brought the prince again into active service, and he gained fresh laurels at Quatre Bras and Waterloo, where he was wounded. The Prince of Orange married, 26th February 1816, Anna Paulowna, youngest sister of the Emperor Alexander I. of Russia. When the Belgian revolution began in 1830, he was called again into public life; and, as governor of the loyal districts, tried by concessions to allay the storm, but the provisional government at Brussels was not to be satisfied, and having over-stepped the limits of his commission, the prince was recalled. In July, he took command of the army, and pushed to the centre of Belgium; when at Louvain, his victorious course was interrupted by French intervention, and the Dutch army retired to the north. Having more liberal views than were then common, the prince took little share in state affairs, and spent his life chiefly at Tilburg, as commander of the army of observation. On the abdication of William I. (see NETHERLANDS), the Prince of Orange assumed the reins of government (1840) as William II. The political movements of 1848 were felt in the Netherlands, as in other countries; and the ministerial plans of reform not having satisfied the party of progress, the king announced his willingness to sanction whatever changes in the constitution were thought necessary, and the storm was averted. The new constitution was proclaimed 3d November 1848. W. died on the 17th March 1849, regretted by all ranks. He was Marshal in the British army, and held a multitude of European orders.—See *Het Leven van Willem II.*, door J. J. Abbink; also the same by Bosscha.

WILLIAM III. (ALEXANDER PAUL FREDERICK LEWIS), reigning king of the Netherlands, was born 19th February 1817, and succeeded to the throne on the death of his father, William II., in 1849. The kingdom has since enjoyed uninterrupted peace, material prosperity has increased, and the public debt has been considerably reduced. W.'s reign has been chiefly distinguished for undertakings which contribute to the true greatness of a nation. The drainage of the Haarlem Lake (q. v.) was completed in 1852, removing an ever-enlarging enemy, and adding nearly 60,000 acres to the wealth-producing power of the country. In 1863, the slaves in the Dutch West Indian colonies were emancipated, under wise restrictions. Railways have been extensively constructed; the water-way to Rotterdam is being improved; and the formation of a canal through the Isthmus of Holland, with a fine harbour on the North Sea, by which the largest ships will easily reach Amsterdam, and 16,000 acres of land be redeemed from the Ij, is in progress. While Prince of Orange, W. married, 18th June 1839, the Princess Sophia Frederica Matilda, daughter of the late King William I. of Württemberg. They have

two sons—William Nicholas Alexander Frederick Charles Henry, Prince of Orange, born 4th September 1840; and William Alexander Charles Henry Frederick, born 25th August 1851.

WILLIAM AND MARY COLLEGE, next to Harvard College, the oldest institution of learning in America, was established at Williamsburg, Virginia, 1692, and endowed with lands and placed under the patronage of the king and queen of Great Britain. In 1718, £1000 were granted 'for the support of as many ingenious scholars as they should see fit.' In 1791, Robert Boyle, Esq., gave part of his property to this college for the education of Indians. At the beginning of the Revolution, half the students entered the army, and the French troops occupied its buildings as a hospital. Here were educated Presidents Jefferson, Madison, and Monroe, Chief-justice Marshall, and General Scott. The library has 53,000 vols.

WILLIAMS, JOHN, a celebrated missionary, was born at Tottenham, London, 29th June 1796. At the age of 14, he was apprenticed to an ironmonger, and during his apprenticeship, displayed a great taste for mechanics, and acquired a knowledge of mechanical arts, which he afterwards turned to great account. Having become deeply religious, he offered himself to the London Missionary Society as a missionary to the South Seas. He was ordained in 1816, and sent to Eimeo, one of the Society Islands. Two months after his arrival, he was able to preach to the people in their native tongue. From Eimeo, he soon went to Huahine, and afterwards to Raiatea, the largest of the Society group. His labours here were attended with great success; the island became Christian, and the arts and habits of civilisation were introduced along with Christianity. Wherever W. went, he not only preached the gospel, but instructed the people in the arts, so as to elevate them from their state of barbarism. At Raiatea, he heard of Raratonga, the chief of the Hervey Islands, and thither he went in 1823. The mission which he founded there was eminently successful; not only Raratonga but the whole group of the Hervey Islands being soon Christianised. In his missionary work, W. made great use of native teachers, trained by himself. He translated the New Testament into the Raratongan language, and prepared books for the schools which he established. After spending some time in Raratonga, he wished to return to Raiatea; but the island in which he lived lay out of the way of vessels, and he resolved to build one. He made all the necessary tools, and in about 15 weeks completed the vessel itself, a boat 60 feet long, and 18 wide, the sails of native matting, the cordage of the bark of the *Hibiscus*, the oakum of cocoa-nut husks and banana stumps. In this vessel, during the next four years, he visited many of the South Sea Islands, extending his missionary labours to the Samoa Islands. In 1834, he came to England, where he remained for nearly four years, during which he procured the publication of his Raratongan New Testament by the Bible Society, and raised £4000 for the purchase and outfit of a missionary-ship for Polynesia. In 1838, he returned to the chosen sphere of his labours, visited many of the islands, and finally the New Hebrides, where he hoped to plant a mission, but was killed, 20th November 1839, and most of his body eaten by the savage natives of Erromanga, on the shores of which he had landed. His death was the occasion of great lamentation in the islands which owed to him their Christianisation and civilisation. W. was remarkably successful as a missionary, not only by his own preaching, but through the instrumentality of natives whom he trained. He possessed in an

extraordinary degree the power of organising. His mechanical skill and genius were also of great service, and no other missionary has ever been so successful in making the progress of civilisation attend upon the progress of Christianity.

WILLIAMS, ROGER, founder of the state of Rhode Island, U. S., was born at Conwyl Cayo, Wales, in the year 1606. In his youth, he came to London, and attracted the attention of Sir Edward Coke by his short-hand notes of sermons, and speeches in the Star Chamber; and was sent by him to Sutton's Hospital, now the Charterhouse School, in 1621; and on April 30, 1624, he entered Jesus College, Oxford, where he obtained an exhibition. He studied Latin, Greek, Hebrew, French, and Dutch, and was ordained a clergyman of the Church of England, but soon became an extreme Puritan, and emigrated to New England, arriving at Boston, February 5, 1631, 'a young minister, godly and zealous, with his wife Mary.' He refused to join the congregation at Boston, because the people would not make public declaration of their repentance for having been in communion with the Church of England; he therefore went to Salem, as assistant-preacher, but was soon in trouble for denying the right of magistrates to punish Sabbath-breaking and other religious offences, as belonging to the first table of the Law. For his opposition to the New England theocracy, he was driven from Salem, and took refuge at Plymouth, where he studied Indian dialects. Two years later, he returned to Salem, only to meet renewed persecution and banishment from the colony, for denying the right to take the Indians' lands without purchase, and the right to impose faith and worship. He held that it was not lawful to require a wicked person to swear or pray, which were both forms of worship; and that the power of the civil magistrate extends only to the bodies, goods, and outward state of men, and not to their souls and consciences. Banished from the colony in 1635, and threatened to be sent back to England in order to prevent the infection of his new doctrines from spreading, he escaped in mid-winter to the shores of Narraganset Bay, accompanied by a few adherents, where he purchased lands of the Indian chiefs, founded the city of Providence, and established a government of pure democracy. Having adopted the belief in adult baptism of believers by immersion, W. was baptised by a layman, and then baptised him and ten others, and founded the first Baptist church in America. Later, he doubted the validity of this baptism, and withdrew from the church he had founded. In 1642, he came to England to procure a charter for his colony, and published a *Key to the Languages of America*, and *The Bloody Tenent of Persecution for Cause of Conscience Discussed, &c.*—his chief work on the nature and sphere of civil government. After returning to Rhode Island, he came a second time to England on business of the colony in 1651, when he published *Experiments of Spiritual Life and Health, and their Preservations*, dedicated to his friend, Lady Vane, and written, as he says, 'in the thickest of the native Indians of America, in their very wild houses, and by their barbarous fires;' also, *The Hireling Ministry none of Christ's*, and *The Bloody Tenent yet more bloody by Mr Cotton's Endeavour to wash it White in the Blood of the Lamb*. At this period, he engaged in an experiment of teaching languages by conversation, and made the acquaintance of Milton. He returned to Rhode Island in 1654, and was elected President of the colony; refused to persecute Quakers, but held a controversy with them, and published *George Fox digged out of his Burrowes*. By his constant friendship with the Indians, he was of great service to the other colonies; but they

refused to remove their ban, or to admit Rhode Island into their league. He died in 1683.—See *Memoirs*, by James D. Knowles (Boston, 1833); William Gammell (Boston, 1846); Romeo Elton (London, 1852).

WILLIAMSBURG, a city of Virginia, U. S., between York and James rivers, 60 miles southeast of Richmond, the site of William and Mary College (q. v.), and the Eastern State Lunatic Asylum. W. was founded in 1632, is the oldest incorporated town in the state, and was the colonial and state capital till 1779. A battle was fought here between General McClellan and the Confederates, May 5, 1862. Present pop. about 1500.

WILLIAMS COLLEGE, an institution of learning in Williamstown, Massachusetts, U. S., founded by a bequest of Colonel Ephraim Williams in 1755; incorporated in 1793, with further endowments of state grant, and the privilege of raising money by a lottery. In 1836, it was provided with an astronomical and magnetic observatory, the first in America. It has since been liberally endowed by Amos Lawrence and Nathan Jackson, and has 11 instructors, 240 students, a lyceum of natural history, and library of 20,000 vols.

WILLIAMSPORT, a shiretown of Pennsylvania, U. S., on the left bank of the West Branch of the Susquehanna River, between Lycoming and Pine Creeks, 75 miles north of Harrisburg. It is on the West Branch Canal, and the intersection of three railways, and has 25 saw-mills, four planing-mills, iron foundries, woollen factories, ten churches, three newspapers, an academy, and two female seminaries. Pop. in 1860, 7560.

WILLIBROD, or WILBRORD, St, first Bishop of Utrecht, and 'apostle of the Frisians,' claims notice as being one of that meritorious band of British and Irish missionaries by whom Christianity was established in Northern Germany. He was born about the year 658, in the kingdom of Northumbria; and, although educated in the monastery of Ripon, where he received the tonsure, was sent, for final instruction, like most of the monks of that age, to the schools of Ireland. After a sojourn of thirteen years in that country, he resolved to devote himself to the conversion of Friesland, in which some of his fellow-monks had already engaged with little success. In 690, he sailed with twelve companions, and passing up the Rhine, arrived at Ultrajectum, the present Utrecht, soon after the victory of Pepin over the Frisians. By Pepin, they were warmly received; and W. having established the first beginnings of his mission, went to Rome in 692, whence he returned, with the sanction of the pope, Sergius I., and continued his labour till 695, when he again visited Rome, and received episcopal consecration, together with the pallium of an archbishop. Fixing his see at Utrecht, he converted a large number of the inhabitants, and extended his missionary colonies from that centre as far as the Danish provinces; and, although he received some check upon the death of Pepin in 714, yet the successes of Charles Martel enabled him soon afterwards to resume, under similar favourable auspices, the work which, after many alternations, ended in the successful establishment of Christianity. W. died at a very advanced age in 738, at the monastery which he had founded at Echternach, near Treves. His festival is the 7th of November.—See Bede's *Ecclesiastical History*, chaps. 10 and 11.

WILLIS, NATHANIEL PARKER, American author, was born at Portland, Maine, January 20, 1807. His father became the publisher of the *Boston Recorder*, said to be the first religious newspaper ever permanently established. Educated at Yale College, he

obtained in 1828 a prize for *Scriptural Poems*. On the completion of his college course, he established the *American Monthly Magazine*, afterwards merged in the *New York Mirror*, in which he was associated with George P. Morris. In 1830, he visited Europe, and contributed to the *Mirror* his *Pencilings by the Way*. Appointed *attaché* to the American legation at Paris, he had favourable opportunities for observing European society; and after a visit to Greece and Turkey, returned to England in 1835, and was married to a daughter of a British officer, General Stace. While in England, on account of some personalities in his writings, more consonant to American than English manners, he became involved in a quarrel with Captain Marryat, which led to a duel. He contributed to the London *New Monthly* his *Inklings of Adventure*, also published in three vols.; and in 1839, returned to New York, and published a literary paper, *The Corsair*, and *Letters from under a Bridge*, written at a beautiful country-seat, named, in compliment to his wife, Glenmary. He wrote also at this period *Tortosa the Usurer* and *Bianca Visconti*, dramas, and the descriptions of scenery illustrated in Bartlett's *United States and Canada*. In 1844, he engaged with General Morris in editing the *Daily Mirror*. His wife died, and he revisited Europe, and published *Dashes at Life with a Free Pencil*, 1845; returned to New York in 1846, he was married to a daughter of the Hon. Joseph Grinnell, of Massachusetts, and with his former partner established the *Home Journal*, to which he contributed most of the following works, also published in a collected form: in 1850, *People I have Met*, and *Life Here and There*; 1851, *Hurrygraphs*, *Memoranda of a Life of Jenny Lind*; 1853, *Fun Jottings*, *A Health-trip to the Tropics*, *A Summer Cruise in the Mediterranean*; 1854, *Famous Persons and Places, Out-doors at Idle Wild*; 1855, *The Rag-bag*; 1856, *Paul Fane, or Parts of a Life else Untold*; 1860, *The Convalescent*. Much of this work was done during a long, brave struggle with what appeared to be consumptive disease. Mr W. was an observant and thoughtful writer, discursive, fragmentary, picturesque, sprightly, quaint, and graceful, full of elaborate ease, and ingenious spontaneity. He edited the *Home Journal* (General Morris having died in 1864), and resided at his romantic highland retreat of Idle Wild, until his death, January 21, 1867.—His sister is a popular writer, under the *nom de plume* of 'Fanny Fern;' and his brother, Richard Willis, is a musician and musical critic.

WILLOW (*Salix*), a genus of trees and shrubs of the natural order *Salicaceæ*, otherwise regarded as a sub-order of *Amentaceæ*. This order or sub-order, to which the Poplar (q. v.) also belongs, is distinguished by having the flowers naked or with a cup-like perianth; numerous ovules; a naked, leathery, one-celled, two-valved fruit; seeds with long hairs; leaves with stipules. In the willows, the flowers are absolutely naked, the stamens from one to five in number, the leaves simple and deciduous. There are many species, but their precise number is not likely to be soon determined, as they are very difficult to distinguish botanically, and varieties are very numerous. They are mostly natives of the colder temperate regions of the northern hemisphere, although some are found in warm countries, as *Salix tetrasperma* in the hottest parts of India, and another species abundantly on the banks of the Senegal. Most of them are shrubs, and some are of very humble growth, particularly those of arctic and alpine regions. Thus, *S. herbacea*, which is common on the mountains of Scotland, seldom rises more than an inch from the ground. *S. arctica* and *S. polaris* are the most northern woody plants. Other

small species are also found to the very limits of perpetual snow in different countries, as *S. Lindleyana* on the Himalaya. Some of the species have already been noticed in the articles OSIER and SALLOW. Some of those which more generally receive the popular name W., are trees of large size, and remarkably rapid growth. The wood of some of them, as the WHITE W., or HUNTINGDON W. (*S. alba*), and the CRACK W. (*S. fragilis*), is used for many purposes, being remarkably durable, especially in damp situations, although light and soft. It was anciently used for shields. Cork-cutters and others employ it for whetting sharp-edged implements. It is very tough. It is used for making paddles of steam-boats, because it wears better in water than any other kind of wood. Willows are often planted as ornamental trees, especially near streams and in moist grounds. Many kinds are also planted on the banks of rivers, to retain the soil in its place, and restrain the encroachments of the river. They are the better adapted for this purpose that they grow readily by cuttings; and willow-stakes driven into a moist soil strike root, and soon become luxuriant. The twigs of most of the willows are very tough and flexible, and are used by coopers for making hoops, and by gardeners for tying espalier trees, and for many similar purposes. They are much used for basket-making and other kinds of wicker-work. See OSIER. Willow withes were probably amongst the first ropes used by man. But the young shoots of many of the kinds with ovate or little elongated leaves, are comparatively brittle, and ill adapted for wicker-work. Willow trees are sometimes treated as pollards, and the top used for fuel and other purposes. They are also often grown as coppice-wood, yielding a great bulk of hoops, poles, fuel, &c. The leaves and young shoots are in some countries used as food for cattle, and even dried and stacked for that use. A fragrant water is distilled in the north of India from the catkins of the EGYPTIAN or CALIPH W. (*S. Egyptiaca*). A principle called *Salicine* exists in the bark of willows, which has been found efficacious in intermittent fevers, and is sometimes used as a substitute for quinine. It is crystalline and intensely bitter.—The flowers of the W., which in many species appear before the leaves, are much sought after by bees. The male catkins of many species are very beautiful, the prominent anthers being of a fine yellow colour, or as in *S. purpurea*, of a rich purple. The WEEPING W. (*S. Babylonica*), of which an illustration is given under WEEPING TREES, is a very ornamental species, a native of the East, now much planted in Britain, and on the continent of Europe, on account of its beautiful pendent twigs. What is called NAPOLEON'S W. is a variety of it.—The White W., or Huntingdon W., is by far the largest species known in Britain. It attains a height of eighty feet, and grows so rapidly that a cutting has been known to become a tree of thirty feet in ten years. Its head is much branched and spreading, its leaves narrow elliptical-lanceolate, silky beneath, and sometimes also above.

WILLOW-MOTH (*Caradrina cubicularis*), a species of moth, of which the caterpillars feed upon the grain of wheat, often doing very much mischief. The perfect insect is of a mouse colour, and its wings are closed flat upon its back when it is at rest. On the upper wings are three transverse wavy lines, and some black dots. The under wings are pearly white, with a slight tinge of brown near the fringe, and brownish nervures. The body is slender, the antennae thread-like. The whole length, without the antennae, is rather more than half an inch. The caterpillar varies in colour from dull ochreous red to dirty green, with a blackish head, two brown spots on the first segment, a wavy line on each side edged with

black. The chrysalis is bright brown. This moth is often abundant in summer, in hayfields, gardens, and barn-yards. The caterpillar feeds on grain

Willow-moth (*Caradrina cubicularis*):

a, caterpillar; b, pupa in its cocoon; c, willow-moth at rest; d, insect with wings expanded.

through the winter, and draws the corn together with a thin silken web in February or March, when about to assume the chrysalis state.

WILMINGTON, a city and port of Delaware, U. S., on Christiansa Creek, near its junction with the river Brandywine, 2 miles from Delaware River, 28 miles south-west of Philadelphia, on the Philadelphia, Wilmington, and Baltimore Railway. It is a handsome, regular town, commanding fine water-views, and has 26 churches, a town-hall, large hospital, St Mary's Roman Catholic College, 4 banks, 6 newspapers, and manufactories of steam-engines, railway cars, and wheel car springs, iron steamboats, machinery, galvanised iron; flour-mills, powder-mills, &c. Pop. in 1860, 21,258.

WILMINGTON, a city and port of North Carolina, U. S., on the left bank of the north-east branch of Cape Fear River, 34 miles from sea. It has a good harbour, with extensive internal navigation, and railway connections, and large exports of lumber, tar, rosin, turpentine, shingles, cotton, &c. It has 5 steam saw-mills, 5 planing-mills (making 25,000,000 feet of lumber per annum), 5 turpentine distilleries. During the war of 1861—1865, it was one of the chief ports of the Confederacy, and was frequented by blockade-runners, until attacked by Commodore Porter's fleet, and land-forces under General Terry, January 13, 1865; on the 15th, Fort Fisher was captured, and the town surrendered on the 22d. Pop. in 1860, 9553.

WILNA. See VILNO.

WILSON, ALEXANDER, American ornithologist, was born at Paisley, Scotland, July 6, 1766. He was the son of a distiller, and was apprenticed to a weaver, for whom he worked seven years, amusing himself at the same time by writing verses. As soon as he was free, he gratified a roving disposition by mounting a pedler's pack, and went to Edinburgh to take part in a discussion, in which he maintained the poetic claims of Ferguson against Allan Ramsay, and, in the same cause, wrote *The Laurel Disputed, a Poem*. The piece by which he is best remembered, is a droll poem in the Scottish dialect, styled *Watty and Meg*. He also contributed to *The Bee*, and made the acquaintance of Burns. He was prosecuted for a lampoon upon a resident of Paisley, and condemned to a short imprisonment, and to burn the libel with his own hand at the Paisley cross. Determined to leave a country where his genius was unappreciated, he sailed from Belfast for America, and landed at Newcastle, Delaware, July 14, 1794, with a few borrowed shillings in his pocket, and no acquaintances. He got work with a copperplate-printer in Philadelphia, then with a

weaver; travelled as a pedler in New Jersey, where the brilliant plumage of the birds attracted his attention; then engaged as a school-teacher in Pennsylvania, and then walked 800 miles to visit a nephew in New York. Teaching a school once more in New Jersey, he lived near the botanic garden of William Bertram, who was well acquainted with birds, and, stimulated and encouraged in his studies of nature, W. resolved to make a collection of all the birds that were to be found in America. In October 1804, he set out on his first excursion, in which he travelled to Niagara Falls, and wrote *The Foresters, a Poem*. In 1805, he learned etching of a Mr Lawson, from whom he had already learned to draw; and was employed on the American edition of *Rees's Cyclopaedia*. He soon prevailed upon the publisher, Bradford, to undertake an American Ornithology. In September 1808, he brought out the first volume, but in a style too costly for the tastes and fortunes of the period, so that he obtained only 41 subscribers in the eastern states, and had no better success in the southern. The second volume was, notwithstanding, brought out in 1810. The following year, he made a voyage down the Ohio, and travelled overland through the then unsettled region of the Lower Mississippi Valley, from Nashville to New Orleans, collecting specimens for his third volume, published in 1812. Exploring the New England States during the war with England, he was arrested at Haverhill, New Hampshire, as a British spy, a circumstance which probably hastened his death, at Philadelphia, August 23, 1813, when he had completed seven volumes of his work. The eighth and ninth were published after his death by George Ord, the companion of his travels and labours, and it was continued by Charles Lucien Bonaparte, in 4 vols. 4to (Philadelphia, 1825—1833).

WILSON, HORACE HAYMAN, a distinguished Sanscrit scholar, was born in London in the year 1786, and was educated for the medical profession. In 1808 he went to India as assistant-surgeon on the Bengal establishment, and in a short time afterwards, on account of his proficiency in chemistry, obtained an appointment in the Calcutta mint as assistant to Dr Leyden. He now applied himself diligently to the study of Sanscrit, and in a few years obtained so high a reputation for his scholarship, that upon the decease of Dr Hunter in 1811, W. was appointed to succeed him as secretary of the Asiatic Society of Bengal on the recommendation of Mr H. T. Colebrooke. In 1813, W. published his first work, viz., *The Mégha Dûta, or Cloud Messenger, a Poem in the Sanscrit Language, by Kâlidâsa; translated into English Verse, with Notes and Illustrations, by H. H. Wilson*. This work, originally published at Calcutta in 1813, was reprinted in London in the following year. His next publication was *A Dictionary, Sanscrit and English, translated, amended, and enlarged from an Original Compilation prepared by Learned Natives* (Calcutta, 1819—1840). This work proved to be of great advantage to students of Sanscrit, and added considerably to W.'s reputation. A second edition of this work was published in 1832; and a new edition of the same, greatly enlarged and improved, by Professor Goldstûcker (Berlin, 1856, &c.), is now in progress. W.'s next publication was *A Collection of Proverbs and Proverbial Phrases in the Persian and Hindustani Languages; compiled and translated chiefly by the late Thomas Roebuck* (Calcutta, 1824). To this, W. prefixed a valuable Introduction, at the same time that he edited the whole, with considerable additions of his own. W.'s subsequent publications were as follows: 1. *Select Specimens of the Theatre of the Hindus, translated from the Original Sanscrit*, 3 vols. (Calcutta, 1827); another

edition, 2 vols. (Lond. 1835). 2. *Documents illustrative of the Burmese War; with Sketch of the Events of the War, and an Appendix* (Calcutta, 1827); another edition (Lond. 1852). 3. *A Descriptive Catalogue of the Oriental Manuscripts and other Articles illustrative of the Literature, History, Statistics, and Antiquities of the South of India; collected by the late Lieutenant-colonel C. Mackenzie*, 2 vols. (Calcutta, 1828). 4. *A Review of the External Commerce of Bengal from 1813—1814 to 1827—1828* (Calcutta, 1830). 5. *The Raghu Vansâ, or Race of Raghu, a Historical Poem, by Kâlidâsa, with a Prose Interpretation of the Text, by Pandits of the Sanscrit College of Calcutta* (Calcutta, 1832). Of this publication, W. was the editor. 6. *Observations on Lieutenant Burnes's Collection of Bactrian and other Coins, by H. H. Wilson, and J. Prinsep* (1834). 7. *A Manual of Universal History and Chronology* (Lond. 1835). 8. *The Vish'n'u-Purâna, a System of Hindu Mythology, translated from the Original Sanscrit, and illustrated by Notes* (Lond. 1840). 9. *An Introduction to the Grammar of the Sanscrit Language, for the Use of Early Students* (Lond. 1841); 2d ed. (Lond. 1847). 10. *Ariana Antiqua, a Descriptive Account of the Antiquities and Coins of Afghanistan, with a Memoir on the Buildings called Topes, by C. Mason* (Lond. 1841). 11. *Selections from the Mahâbhârata, edited by F. Johnson* (Lond. 1842); this has a Preface and Notes by H. H. Wilson. 12. *Rig-Veda-Sanhita, a Collection of Ancient Hindu Hymns, translated from the Original Sanscrit* (Lond. 1850). 13. *The Present State of the Cultivation of Oriental Literature, a Lecture delivered at a Meeting of the Royal Asiatic Society* (Lond. 1852). 14. *A Glossary of Judicial and Revenue Terms, and of useful Words occurring in Official Documents relating to the Administration of the Government of British India, from the Arabic, Persian, Hindustani, &c.* (Lond. 1855). 15. *Principles of Hindu and Mohammedan Law, republished from the Principles and Precedents of the same, by the late Sir William Hay Macnaghten, and edited by H. H. Wilson* (Lond. 1860). Many of these works were produced while W. held the office of Assay-master and Secretary of the Mint at Calcutta. In his official capacity, he often received the thanks of the government of India for reforms in the coinage and other services. He also encouraged in every way the progress of education among the natives of India, especially Bengal. He was for many years secretary to the Public Instruction Committee at Calcutta, and took great trouble in directing the studies of the Hindu College. He was at the same time noted for his musical skill, and his talents as an amateur actor—qualities which made him a great favourite in Calcutta society. In 1833, the Boden Professorship of Sanscrit was founded in the university of Oxford, and W. was elected to that lucrative post, not without strong competition. He accordingly left Calcutta for England; and soon after his arrival was appointed Librarian at the East India House, in succession to Sir C. Wilkins. This appointment he held in conjunction with the professorship until his death, which occurred on May 8, 1860. He was married to a grand-daughter of the celebrated Mrs Siddons, by whom he had several children. W., as an orientalist, takes rank with Sir W. Jones and H. T. Colebrooke. Even the various publications above mentioned by no means sufficiently indicate the extent and variety of his researches, many of which are embodied in papers contributed to the *Journal of the Asiatic Society of Bengal*, and other periodicals.

WILSON, JOHN, famous as Professor Wilson, and the Christopher North of *Blackwood's Magazine*, was born on May 18, 1785, at Paisley, where his

father was a wealthy manufacturer. His earlier education he received in the house of Dr M'Letchie, minister of the parish of Mearns, a wild moorland district in Renfrewshire, his boyish residence in which he long afterwards commemorated in some of his most charming essays. After having been transferred for a time to the care of the Rev. Joseph Macintyre of Glenorchy, in the Highlands, the love of which became for him a lifelong passion, he was sent to the university of Glasgow, where he remained for four years, distinguished as on the whole a diligent and successful, though somewhat fitful and irregular student. In 1803, he went to Magdalen College, Oxford, where he became notable at once for the splendour of his intellectual gifts, and for his supremacy in the various athletic sports—boxing, rowing, running, &c.—which have always formed a not inconsiderable part of the education bestowed at the English universities. In 1806, he signalled himself by his Newdigate prize poem, *On the Study of Greek and Roman Architecture*; and the year after, he took his degree of B.A., that of M.A. following in 1810. Meantime, he had left Oxford, and settled himself in Cumberland, attracted partly by the beauty of the Lake Country, and partly by a desire to cultivate the intimacy of Wordsworth, of whose genius he was already a devout admirer. He purchased the lovely little property of Elleray, where, for some years, he resided almost constantly. Besides Wordsworth, there were available in the district for intellectual converse De Quincey, Southey, and Coleridge (to whose *Friend* he contributed some essays). With all of them, he became intimate; and when he wearied a little of 'celestial colloquy divine' with them, he sought a variety to life in measuring his strength against that of the far-famed Cumberland wrestlers, the very sturdiest of whom has left it on express record that he found him 'a vera bad un to lick.' In 1810, he married a Miss Jane Penny, a Liverpool lady, of great personal attractions and much amiability of character, in his union with whom he found the main happiness of his life. He now seriously devoted himself to poetry; and in 1812, published his *Isle of Palma*, which attracted considerable attention, and was followed in 1816 by *The City of the Plague*. This work shewed a marked increase of power; but it is questionable, despite the grace, music, and tender feeling of much of his verse, whether, as a poet, W. would ever have succeeded in developing the real force of his genius. His true field, however, was found on the starting, in 1817, of *Blackwood's Magazine*. Some years previously, a pecuniary disaster had befallen him; the fortune of £30,000 left him by his father being so seriously curtailed by the misconduct of a relative as to necessitate the breaking up of his establishment at Elleray. On this, he transferred himself to Edinburgh, where, in 1815, he was called to the Scottish bar; but it does not appear that he had any opportunity of practice. As one of the briefless, with plenty of spare time on his hands, along with his friend Lockhart, then in similar case, he lost no time in proffering his aid to Mr Blackwood. The astute publisher was at no loss to estimate the value of their alliance; and it is not too much to say that during its earlier years, Lockhart and W. were the soul of the success of the magazine. Presently, Lockhart was withdrawn to succeed Gifford as editor of the *Quarterly Review* in London; and W., though never in any strict sense its editor—Blackwood himself throughout exercising a severe control—became, in the eye of the public, more and more identified with the Magazine; in a certain modified, yet very real sense, to all intents for many years he was editor

of the Magazine, and under his famous pseudonym of Kit North, swayed it before the world. In 1820, he was appointed to succeed Dr Brown, deceased, as Professor of Moral Philosophy in the university of Edinburgh, his friend, Sir W. Hamilton, being one of the defeated candidates. His real claims to such a post, though not to be compared with those of Hamilton—who, at that time, however, had given little or no proof before the public of his consummate accomplishment and ability—have been somewhat unduly depreciated. They were not so by Hamilton himself, whose opinion it was, as reported by Mr De Quincey, that 'Wilson's philosophic subtlety of intellect was not the least wonderful of his many wonderful gifts.' Thus much is certain, that as a professor, though somewhat desultory in his methods, he had an almost unexampled power of stimulating the enthusiasm of his students. Out of his class-room, however, it must be admitted he but indifferently succeeded in attaining the staid ideal proper to the learned and respectable class of men with whom he was thus somewhat oddly associated. He was the most 'muscular' of 'Christians;' and on more than one occasion, the singular spectacle was exhibited of a Scotch professor of moral science taking off his coat in a public marketplace, to inflict personal chastisement on some ruffian, whose obnoxious proceedings had done outrage to his nicer sense of the fitness of things. Though sedulous and strict in his discharge of his duties as a professor, W. was loyal in his adhesion to Blackwood, and his contributions to the Magazine, in their mere amount enormous, continued to form the main part of his activity. In 1840, he suffered an irreparable loss in the death of his wife. His grief for a while nearly prostrated him, and seems to have flung something of a shadow over what of life remained to him. He continued, however, to contribute to *Blackwood*, though now somewhat more intermittently; and in 1842, he published, as *The Recreations of Christopher North*, a selection, in two volumes, from the mass of his essays furnished to it. During the session 1852—1853, he was smitten by an attack of paralysis, which permanently incapacitated him for the discharge of professorial duty; and in Edinburgh, on April 3, 1854, he died. During his last years, he enjoyed a pension of £200 a year from government, in acknowledgment of his literary services. Besides his poetry and periodical writings, he published in 1822 a volume of sketches, entitled *Lights and Shadows of Scottish Life*, which was followed the year after by his tale of *Margaret Lindsay*. In these, as in his poems, the robuster side of his mind is scarcely, if at all, represented; but the tender idyllic grace and charm by which they are pervaded, secured for them an extensive popularity, some portion of which they have since continued to retain. In his miscellaneous prose essays, critical and descriptive, and most especially in the celebrated series of dialogues entitled *Noctes Ambrosiana*, the true power of his genius is revealed. Of the genius, there can be little question; though as to whether it has succeeded in embodying itself in forms which are likely to be permanent, there may reasonably be difference of opinion. The materials for judgment are before the world in the collected (or rather selected) edition of his *Miscellanies*, published since his death by his son-in-law, Professor Ferrier. As a magnificent *potentiality*, it is scarcely exaggeration to speak of W. along with Burns and Scott as a member of the trinity (so to speak) of Scottish literary genius. Certain it is, that nearly as effectually as they did, he stormed the heart of the Scottish people, and became, in his later years—the Great

Novelist being gone—their idol and accepted literary representative. If he has left behind him no work sacred as his literary *monument*, thus much was almost involved in the conditions under which he wrote. Writing as he did from month to month for the instant purpose of the hour, wise and steady concentration of his energies became more and more difficult for him. Not the less, when all reasonable deduction is made, he holds his place as one of the most notable literary figures in the earlier half of this century. His *range* of power is extraordinary: from the nicest subtleties of feminine tenderness, he passes at will to the wildest animal riot and the most daring grotesqueries of humour; and in what he terms ‘numerous prose,’ the prose poem or rhapsody—a questionable and perilous, though, within wise limits, a legitimate form of art—he may be held, in his finer passages, to be at this day without a rival. As regards his life in detail, full information may be found in the affectionate and felicitous *Memoir*, published in 1863 by his daughter, Mrs Gordon.

WILSON, RICHARD, an English landscape-painter of great eminence, was the son of a clergyman in Montgomeryshire, and was born in 1713 at Pinegas in that county. His early love of drawing attracted the attention of Sir George Wynne, his relation, who had him placed under the tuition of a portrait-painter in London, by name Thomas Wright. In portrait-painting, W. had considerable success, but can scarcely be said to have become eminent, when in 1749 he went to Italy to study the works of the old masters. At Venice, he formed the acquaintance of the then famous Zuccarelli, who was so struck with the merit of a careless and random landscape sketch dashed off by him as the whim of an idle moment, that he earnestly advised him to forsake portrait for landscape, as plainly his true vocation. He was further encouraged in doing so by the praises of Vernet at Rome, who was greatly charmed by some of his earlier efforts. To landscape-painting, he now exclusively devoted himself; and before returning to England in 1755, he had succeeded at Rome in establishing a considerable reputation. In London, in 1760, he exhibited his great picture, the ‘Niobe,’ which was bought by the Duke of Cumberland, and at once secured him rank as one of the first painters of his time. Another celebrated work, his ‘View of Rome from the Villa Madama,’ was exhibited in 1765, and found a purchaser in the Marquis of Tavistock. Strange to say, however, his pictures, since so famous, failed to hit the general taste; and while far inferior artists were eagerly patronised by the public, W. was for the most part neglected. Failing in the general market, he fell into the hands of the picture-dealers, to whom he would frequently for a few pounds dispose of pictures which have since been sold for large sums. So straitened did he frequently find himself, that in 1770 he was fain to solicit, and happy to obtain, the appointment of Librarian of the Royal Academy, with the trifling salary attached to it. As explanation in part of his otherwise almost unaccountable want of success, it is alleged that his manners were rude, and his temper somewhat unaccommodating; with his brethren in art, he was notoriously the reverse of popular; and it is probable that in the general conduct of life he exhibited some lack of that tact and skill which even men of the most distinct genius may find of some little avail to procure them a prompt recognition of it. By the death of a brother, who left him a handsome sum of money, he was rescued from the indigence, as it may almost be called, in which the greater portion of his life had been passed; and retiring to Llamberris in Denbigh-

shire, he died there some few years after in 1782. Of his numerous pictures, now much prized, many are familiar to the public by engravings; in the National Gallery, three very fine specimens of him may be found; and several others form part of the well-known Vernon Collection.

WILSON, GENERAL SIR ROBERT THOMAS, was born in the year 1777 in London, where his father was a painter. He was educated at Westminster, and afterwards at Winchester, and when scarcely 17, he joined the 15th Light Dragoons, then serving under the Duke of York in Belgium, and took part in some sharp service, in which the regiment greatly distinguished itself. Shortly after his return to England, he was married to a lady of great beauty and some fortune, to whom, through life, he seems to have been ardently attached. In 1798, he was engaged in Ireland in the suppression of the rebellion; and the year after, he served in the unfortunate campaign of the Helder, and was present with his old regiment at the battle of Egmont-op-Zee. That in everything he proved himself a capable officer, may be inferred from his appointment soon after to command the small force of cavalry which served under Sir Ralph Abercromby in Egypt. Here he formed a warm friendship with General, afterwards Lord Hutchinson, who succeeded to the command of the army after the death of Abercromby. His next service was at the conquest of the Cape of Good Hope in January 1806, where again he commanded a small cavalry force. In the latter part of that year he went abroad on the staff of his friend, Lord Hutchinson, who was sent on a mission to the king of Prussia, then a fugitive from his capital, and awaiting the result of the conflict pending between Napoleon and his allies, the Russians. W. had now, for the first time, an opportunity of seeing war on a really gigantic scale, being present at the desperate battle of Eylau. (q. v.). The peace of Tilsit ensued, and W. thereupon returned to England. The struggle in the Peninsula had now commenced, and W. was sent to take part in it; he was active in the embodiment and training of the Portuguese army, and subsequently, under Wellington, he commanded a Spanish brigade at the battle of Talavera. From this field of action he was, however, withdrawn; and in 1812, he was attached to the Russian army as English military commissioner. During the tremendous struggle which resulted in the capture of Moscow, and the operations which followed in pursuit of the doomed French army, he rendered important service both in council and in the battle-field; and he seems to have won the especial regard and confidence of the Emperor Alexander. Throughout the subsequent campaigns in Germany, and those which followed in France, ending with the capture of Paris in 1814, he was present in a similar capacity in the camp of the allies. At Lützen, he took command of the Prussian reserve, and at a particular crisis of the battle, succeeded in severely checking the enemy. At Bautzen, he also distinguished himself; and a day or two after, the Emperor of Russia presented to him publicly the cross of the Order of St George, saying that he gave it ‘as a memorial of his esteem for his courage, zeal, talent, and fidelity to my service.’ His services during this period will be found noted in every military History of the time; and they amply prove him to have been a most gallant and accomplished soldier.

After the peace, he became involved in the unfortunate matter of Queen Caroline; and for his censure of the course pursued by government he was dismissed the army. He was afterwards, however, reinstated. In 1841, he attained the rank of general; and from 1842 to 1849, he held the post of governor

of Gibraltar. In 1818, he had been returned to parliament in the Liberal interest for Southwark, and he retained his seat till 1831. On 9th May 1849, having just returned from Gibraltar, he died suddenly in London. During his life, he published several works; in 1804, *An Inquiry into the Military Force of the British Empire*; in 1811, *Campaigns in Poland, with Remarks on the Russian Army*; and in 1817, a *Sketch of the Military Power of Russia*. During his foreign campaigns, he kept copious private diaries; and of these, two most interesting volumes, 'edited by his nephew and son-in-law, the Rev. Herbert Randolph, M.A.,' were some years since published by Murray of London. A *Life* of him has likewise been published by Murray, under the same superintendence.

WILTON, a market-town and parliamentary borough in Wiltshire, at the junction of the Nadder and Wily, affluents of the Avon, 3½ miles west-north-west of Salisbury. The New Church, a magnificent Romanesque edifice, decorated in the richest and most tasteful manner, was erected in 1844 by the Right Hon. Sidney Herbert, at a cost of £20,000. The principal industry of the town is the manufacture of carpets, especially Axminsters, and the carpets called Saxony, made of short staple wool. The burgh returns one member to the House of Commons. It is a station on the Salisbury branch of the Great Western Railway. Pop. of parliamentary borough (1861) 8657; of town, 1930.

W., a very ancient, and at one time important town, was the capital of the Anglo-Saxon kingdom of Wessex, and gave name to Wiltshire. From the 9th c. to the year 1244, it was a busy and prosperous place; but in that year, the Great Western Road, which had formerly passed through it on its way from Old Sarum, was diverted, and the prosperity of the town came to a close. The town stands near the site of a monastery given to Sir William Herbert, first Earl of Pembroke, by Henry VIII.; and the locality is rich in associations connected with the Herbert family. Here Sir Philip Sidney wrote part of his *Arcadia*. The present mansion is noted for its collection of statues, and for its pictures, including several excellent Van Dycks.

WILTSHIRE, or **WILTS** (called by the Anglo-Saxons *Wiltonshire*, from their capital town, Wilton, q. v.), one of the south-western counties of England, bounded on the W. and N. by Somerset and Gloucester, and on the E. and S. by Berks, Hants, and Dorsetshire. Area 865,092 acres; pop. (1861) 249,311. The county is divided into two unequal parts—the plains in the north, and the hill district, which comprehends the greater part of South W.; and the separation between these two parts is very nearly that of the Great Western Railway, the course of which across the county is from north-east to south-west, past Swindon and Chippenham. The plains incline north to the basin of the Thames, which forms in part the northern boundary, and are noted for their agricultural capabilities. The surface of this district is checkered with corn-fields and rich pastures, and here the cheeses for which W. is well and favourably known are produced. The hill district presents ranges of bleak downs, with deep valleys, and is thinly peopled, much of it consisting of solitary sheep-walks, on which it is estimated 700,000 sheep are pastured. Inkpen Beacon, 1011 feet high, at the junction of W., Hampshire, and Berkshire, is the nucleus whence proceed the North and South Downs of Surrey and Sussex, and the hills which, running south through this county, become the North and South Downs of Dorsetshire. Agriculture is carried on with the assistance of modern improvements; many swine are reared, and W.

bacon is famous. Portland stone is quarried at Swindon, Tisbury, and in other localities; and a stone called Forest Marble yields coarse tiles and flagstones, and is said to retain in perfect preservation 'the ripple-marks of waves and the footprints of crustaceans.' The manufacture of woven goods, carpets and other woollen goods, silks and linens, is carried on at Trowbridge, Wilton, Bradford, Devizes, Heytesbury, &c. There are iron mines and blast-furnaces at Westbury and Seend. The principal rivers are the Thames, with its tributary, the Kennet; and the Avon, with its tributaries, the Nadder and Wily. The county, exclusive of boroughs, sends four members to the House of Commons. Capital, Salisbury.

W. abounds in early and interesting antiquities. Among these may be mentioned its Druidical temples (see **AVEBURY** and **STONEHENGE**), British entrenchments, roads, and villages, barrows (in which beads, rude axes of stone, arrow-heads of flint, and sometimes articles in gold, brass, or iron, have been found along with the relics of mortality), Saxon encampments, Roman roads and Norman castles, of which there are many remains.—See *History of Ancient Wiltshire*, by Sir R. C. Hoare.

WINCHESTER, a famous historical city, and parliamentary and municipal borough, chief town of Hampshire, is situated in the middle of the county, on the right bank of the Itchen, 67 miles south-west of London by railway, and 60 in a direct line. It consists of one main street, crossed by a number of streets running at right angles to it, and was in early times surrounded by a wall, of which remains exist. The houses for the most part spread over a hill rising from the valley of the Itchen; but the cathedral, and some of the older and more interesting portions of the city, stand on level ground close to the river-bank. The Castle-hill is the site of the old castle or royal palace, built in the 13th c. by Henry III., and of the magnificent hall, of which the only remaining portion is used as the County Court. About a mile from the town is the famous hospital of St Cross, founded in 1136 by a bishop of W., Henry de Blois, for 13 poor men, 'decayed and past their strength.' It was munificently endowed; but its sources of income have been narrowed, and its ancient charters and grants were destroyed during the 13th century. Its income now is £1088 *per annum*, and it supports 13 poor brethren, affords relief to a number of external poor, and distributes general doles on the eves of great festivals. The hospital is entered by a gateway, after passing which, a pleasing view is obtained of the buildings, which occupy three sides of a quadrangle, the fourth side being occupied by a most picturesque ancient church in Transition Norman, which formed part of the institution. There is a city library and a museum; the latter contains some very interesting local antiquities. Charles II. commenced a palace here, but the part completed is now used as barracks. The city cross in the High Street, dating from the 15th c., is very beautiful in design.

The college of W., called originally 'Seinte Marie College of Wynchestre,' now St Mary's College or Winchester College, was founded by William of Wykeham, Bishop of W., in 1387, and the buildings were completed in 1393. The buildings are, for the most part, of the age of the founder, Bishop Wykeham, and consist of two quadrangles and a cloister, together with recently erected houses for the commoners. The famous *dulce domum* is sung by all the boys in the courts of the college before the breaking up of the school at the long vacation. The foundation consisted originally of a warden, 10 Fellows, 70 scholars, a

head-master (*informator*), an usher (*ostiarus*) or second master, 3 chaplains, 3 clerks or singing-men, and 16 choristers. By an ordinance of the Oxford University Commission, which took effect in 1857, the number of Fellowships is to be reduced, as vacancies occur, to six, the number of scholars to be increased to 100, and 20 exhibitions to be founded; and in accordance with this regulation, the number of Fellows is now (1867) nine. The charter of the school, which is in existence, was granted by Richard II. in 1396, and confirmed by all the subsequent sovereigns of England, Mary excepted, down to Charles II. The visitor is the Bishop of W., and the warden and two Fellows of New College, Oxford, hold an annual 'scrutiny,' which practically consists in questioning the seven senior and seven junior scholars as to their comforts, and listening to any complaints they have to make. The endowment, which amounts at present to about £17,600 annually, consists of landed property and funded stock; and of this about £2600 goes to expenses of management. The warden and Fellows are the governing body of the college. The pupils of the school are of two classes—foundation scholars and commoners. The scholars are elected, between 10 and 14 years of age, by the warden, sub-warden, and head-master of the college, jointly with the warden and two Fellows of New College, Oxford, by competitive examination; the average annual number of vacancies being 10, and the number of candidates 150. The scholars are well boarded, lodged, and educated, at the expense of the foundation; having to pay, for some incidental charges, only from £1, 10s. to £5, 14s. per annum; but tradition exercises a powerful influence at W., and many of the quaint old customs of the school, such as dining off wooden trenchers, &c., are still retained. The number of the commoners has fluctuated much; but owing to the better position in which they were placed by the new regulations of 1857, they have averaged 200 annually for some years; they generally enter between 11 and 16 years of age, and stay 3—4 years, and not being foundation-boys, are boarded in the houses of the head and other masters, at a total annual cost of £115 (including expense of tuition, pocket-money, and cost of travelling). W. possesses 15 Fellowships and 30 scholarships at New College, Oxford (also founded by William of Wykeham), open to scholars and commoners alike (since 1857), and tenable for five years, besides numerous other prizes. Fagging is permitted to the 18 chief boys, who are called 'prefects.' The monitorial system was first established here, and is still in force—the monitors being the 'prefects.'

A church is said to have been built at W. in the year 169; to have been destroyed in 266, restored in 293, and converted into a 'temple of Dagon' (by whom we are to understand Wodin) by the Saxons under Cerdic in 495. In 635, the polluted church was pulled down, and a new one commenced, under the superintendence of Birinus, the first apostle of Wessex; and King Kynegils granted the whole of the land for the space of seven miles round the city for the support of the episcopal seat and the re-established monks. From the year 674, the succession of bishops of W., of which the celebrated St Swithin (see SWITHIN, St) was one, continues unbroken. Of Birinus's cathedral, however, in which most of the Saxon kings of Wessex (see HEPTARCHY) were interred, and on the altar of which, according to tradition, King Canute hung up his crown after the well-known scene on the sea-shore, no portion remains, and a new cathedral—the present one—was built 'from the foundations' by Bishop Walkelin (1070—1097); and after its completion, and the removal into it of the precious relics of Birinus's

cathedral, that old edifice was pulled down. William of Wykeham—regarding whose qualifications to fill the episcopate, Wicliffe can say nothing more than that he was 'one wise in building castles'—was Bishop of W. from 1367 to 1404, and has more closely than any other bishop associated his name with his episcopal city and its cathedral. He greatly enlarged and beautified the building, and he began the transformation of the nave from Norman to Perpendicular. The cathedral is 520 feet long, longer than any other cathedral out of Italy, with the exceptions of those of Ely (560 feet), and Canterbury (525 feet). Its breadth at the transepts is 208 feet, the length of its nave is 351 feet, its height 86 feet, and a low central Norman tower 150 feet high. The exterior is somewhat disappointing, owing to its unusual want of decoration, and to the lowness of its Norman tower; but the interior is magnificent, and contains many objects of the highest interest—as the tomb of William Rufus; bronze figures of Charles I and James I.; mortuary chests which contained the ashes of a number of West Saxon kings and bishops, but which were opened during the Civil War, and their contents scattered about the church; the golden shrine of St Swithin, with some excellent specimens of sculpture, both ancient and recent; the tomb of Edmund, the son of King Alfred—Alfred himself being buried in the vicinity—and the tomb of Izaak Walton. The various architectural styles to be noted in the cathedral are: Early Norman in the crypt and transepts; Early English in the eastern aisles and chapels behind the presbytery; Decorated in the piers and arches of the presbytery; and Perpendicular in the nave, which, for beauty and grandeur, is perhaps unrivalled in England. After the cathedral, there are many churches of great interest, and in the Transition Norman and Perpendicular styles; and there are many other buildings of a religious and educational kind. The industries of W. are unimportant. Pop. of municipal and parliamentary borough (1861), 14,776, represented by two members in the House of Commons.

W., the Roman *Venta Belgarum*, was the site of a British city before the arrival of the Romans in Britain, *Caer-Gwent* (*Gwent* = champaign or down). It afterwards became a Roman station, and, as such, was a place of considerable importance, and contained temples of Apollo and Concord. When taken by the Saxons in 495, it contained, at least one Christian church. The Saxons changed the name *Venta* into *Winte*, and called the town *Wintanceaster*—i. e., the city of the *Winte*, or Winchester. In 1265, during the barons' war, W. was sacked. Up to this time the trade of this town had rivalled that of London; but after being sacked, it never recovered its commercial prosperity. From the time of Charles II., the town has gradually declined—its chief sources of life and movement being the cathedral and the college.

WINCHESTER, a village of Virginia, U. S., in the valley of the Shenandoah, 150 miles north-north-west of Richmond, 71 west-by-north from Washington; 32 miles by railway to Harper's Ferry. It has twelve churches, an academy, two newspapers. March 12, 1862, it was occupied by the Federal General Banks, and was during the war the scene of frequent conflicts, and occupied in turns by the Federal and Confederate armies. Pop. in 1860, 4392.

WINCING MACHINE, the wheel used by dyers for winding out of their dye-vats long pieces of cloth. The vat is often divided by a partition, and the wincing-machine is generally so placed that it will wind the piece of cloth from one

compartment to the other, according to the direction given to the handle.

WINCKELMANN, JOHANN JOACHIM, well known as the critical expounder and historian of ancient classical art, was born of poor parents in the year 1717, at Stendal, in Prussia. He very early shewed an eager desire for knowledge, and being sent to the free school of the place, became so special a favourite with the rector of it, that he was taken into the rector's house as a companion, when age and blindness made some assistance necessary to him. After studying for a time in Berlin, he went, in 1738, to the university of Halle, where he remained two years engaged in the study of theology, which, however, he found so distasteful that, at the end of that time, he relinquished it, accepting a situation as tutor in a private family at Osterburg. In 1743, he became a schoolmaster at Seehausen—a wretched position, from which he was rescued by the Count von Bünan, who employed him as secretary in his library at Nothenitz. Here he remained some years. Being in the vicinity of Dresden, he had frequent opportunities of inspecting the famous treasures of art accumulated there. He also made the acquaintance of some artists of eminence, among others, the well-known Oeser; and the enthusiasm was awakened which determined his subsequent career. To the theory and history of art he now resolved to devote himself; and on being thrown into the society of the Pope's nuncio, Cardinal Archinto, he was induced, after some hesitation, to become a Roman Catholic, on a promise of a pension being procured for him, to enable him to proceed to Rome. Thither he repaired in 1755, having previously published at Dresden a treatise, entitled *Gedanken über die Nachahmung der Griech. Werke*, &c. (Reflections on the Imitation of the Antique, 1754). Of this work he issued, in 1756, a new and enlarged edition. At Rome, he prosecuted his studies with the utmost ardour, and every facility was afforded him. In 1758, he visited Naples, to examine the celebrated remains of Herculaneum, Pompeii, and Pæstum; and went also to Florence, for the purpose of cataloguing the famous collection of antique gems belonging to Baron de Stosch, a labour which occupied him for nine months. Soon after, the Cardinal Albani appointed him his librarian, and the salary attached to this post, with the pension continued from Dresden, in itself a somewhat meagre pittance, enabled him to prosecute his studies in comfort. The first-fruit of these appeared in his treatise, entitled *Anmerkungen über die Baukunst der Alten* (Remarks on the Architecture of the Ancients), which was printed in Germany in 1762; and two years afterward, the great work of his life, on which he had been long engaged, the celebrated *Geschichte der Kunst des Alterthums* (History of Ancient Art), was issued from the press of Dresden. In 1767, a supplement to it was added. He also gave to the world the result of his researches at Herculaneum; and in 1766, his *Monumenti Antichi Inediti*, an elaborate work with plates.

In 1768, W., by this time famous throughout Europe, set out to revisit Germany. His destination was Berlin; but on the way, a strange yearning seized him for the Italy he had left; on his reaching Munich, it was no longer to be resisted; and he started thence on his return to Rome. He went by Vienna, where the most flattering attentions were paid him; proceeding thence to Trieste, where he came by his tragic end at the hands of a fellow-traveller, by name Francesco Arcangeli, who murdered him in order to plunder his effects. In this he did not succeed, being scared almost in the act, and presently caught and executed.

W. was the forerunner of a great movement; and his influence has been deeply felt in all the subsequent literature of the subject to which he devoted himself. Even at this day, when a good deal of it is regarded as obsolete, his great *History* remains as a work not to be neglected by any one seriously concerning himself with the study of this branch of aesthetics. The most complete edition of W.'s works is Fernow, Mayer, and Schulze's (8 vols. new ed. Leip. 1823).

WIND is air in motion. The force of the wind is measured by Anemometers (q. v.), of which some measure the velocity, and others the pressure. The following are a few velocities of wind, translated into popular language: 7 miles an hour is a gentle air; 14 miles, a light breeze; 21 miles, a good steady breeze; 40 miles, a gale; 60 miles, a heavy storm; and 80 to 100 miles, a hurricane sweeping everything before it. We also add a few comparisons of velocity and pressure: 5 miles an hour is a pressure of 2 oz. on the square foot; 10 miles, $\frac{1}{2}$ lb.; 20 miles, 2 lbs.; 30 miles, 4 $\frac{1}{2}$ lbs.; 40 miles, 8 lbs.; 51 miles, 13 lbs.; 60 miles, 18 lbs.; 70 miles, 24 lbs.; 80 miles, 32 lbs.; and 100 miles, 50 lbs. During the severe storm which passed over London, on February 6, 1867, the anemometer at Lloyd's registered a pressure of 35 lbs. to the square foot—in other words, the wind during that storm acquired a velocity of 83 miles an hour. Wind is most frequently measured by estimation.

Seamen have more need than landmen to pay attention to every minute variation in the strength of the wind, as well as its direction, and to adopt such phrases as will render that strength generally intelligible. The *Anemometer* (q. v.), which is used on land by scientific men for this purpose, is unsuited to the wants of seamen. They have found it convenient to divide winds into twelve kinds, in relation to strength, designated thus: *faint air, light air, light breeze, gentle breeze, fresh breeze, gentle gale, moderate gale, brisk gale, fresh gale, strong gale, hard gale, and storm*. Each of these is determined by the amount and kind of sail which a ship can safely carry at that moment. The estimate of the wind's force by the scale 0 to 12, means that 0 represents a calm, and 12 a hurricane. If such estimations be divided by 2, and the quotient squared, the result will be the pressure in pounds, approximately.

All wind is caused, directly or indirectly, by changes of temperature. Suppose the temperature of two adjacent regions to become, from any cause, different, the air of the warmer, being lighter, will ascend and flow over on the other, whilst the heavier air of the colder region will flow in below to supply its place. Thus, then, a difference in the temperature of the two regions gives rise to two currents of air—one blowing from the colder to the warmer along the surface of the earth, and the other, from the warmer to the colder, in the upper regions of the atmosphere; and these currents will continue to blow till the equilibrium be restored.

Winds are classed into *Constant, Periodical, and Variable Winds*.

CONSTANT WINDS. *The Trade-winds*.—When the part of the earth's surface which is heated is a whole zone, as in the case of the tropics, a surface-wind will set in towards the heated tropical zone from both sides, and uniting will ascend, and then separating, flow as upper currents in opposite directions. Hence, a surface-current will flow from the higher latitudes towards the equator, and an upper-current towards the poles. If, then, the earth were at rest, a north wind would prevail in the northern half of the globe, and a south wind in the southern half. But these directions are modified by the rotation of the earth

on its axis from west to east. In virtue of this rotation, objects on the earth's surface at the equator are carried round toward the east, at the rate of 17 miles a minute. But as we recede from the equator, this velocity is continually diminished; at lat. 60°, it is only 8½ miles a minute, or half of the velocity at the equator; and at the poles it is nothing. A wind, therefore, blowing along the earth's surface to the equator, is constantly arriving at places which have a greater velocity than itself. Hence, the wind will lag behind, that is, will come up against places towards which it blows, or become an east wind. Since, then, the wind north of the equator is under the influence of two forces—one drawing it south, the other drawing it west—it will, by the law of the composition of forces, flow in an intermediate direction, that is, from north-east to south-west. Similarly, in the southern tropic, the wind will blow from south-east to north-west. All observation confirms this reasoning. From the great service these winds render to navigation, they have been called the Trade-winds. It is only in the Pacific and Atlantic Oceans that the trade-winds have their full scope. In other parts of the trades' zone, such as Southern Asia and intertropical Africa and America, they are more or less diverted from their course by the unequal distribution of land and sea, as explained under MONSOON (q. v.).

In the Atlantic, the *North Trades* prevail between lat. 9° and 30°, and in the Pacific, between lat. 9° and 26°; and the *South Trades*, in the Atlantic, between lat. 4° N. and 22° S., and in the Pacific, between lat. 4° N. and 23½° S. These limits, however, are not stationary, but follow the sun, advancing northward from January to June, and southward from July to December.

Region of Calms.—This is a belt, 4° or 5° broad, stretching across the Atlantic and Pacific, parallel to the equator. It marks the meeting-line of the north and south trades, where they mutually neutralise each other. Here also occur heavy rains, and thunder-storms almost daily. This belt varies its position with the trades, reaching its most northern limit in July, and its most southern in January. When the belt of calms nears the African coast, in the Gulf of Guinea, the copious rainfall gives rise to the strong steady-blowing gales of that coast, called *Tornadoes*.

Return Trades.—It is proved by observation that, while there is within the tropics a surface-wind blowing toward the belt of calms, there is at the same time prevailing, in the higher region of the air, a counter-current constantly flowing toward the poles. These great aerial currents descend to the surface after they have passed the limits of the trade-winds, forming the south-west or west-south-west winds of the north temperate, and the north-west or west-north-west winds of the south temperate zones. The *vesting* of these great equatorial currents is produced by the same cause that gives *easting* to the trade-winds, viz., the rotation of the earth on its axis. Owing to the interference of the north-east or polar current with these winds, the irregular distribution of land and water, mountain and plain, and storms diverting them out of their course, they do not blow with the constancy of the regular trade-winds. They are, however, sufficiently marked and decided to be classed with the constant winds.

PERIODICAL WINDS. Land and Sea Breezes.—These are the most general, as well as most easily explained, of the periodical winds. On the coast, within the tropics, a breeze sets in from the sea in the morning, at first a mere breathing on the land, but gradually it increases to a stiff breeze in the heat of the day, after which it sinks to a calm towards

evening. Soon after, a contrary breeze springs up from the land, blows strongly seaward during the night, and dies away in the morning, giving place to the sea-breeze as before. These winds are caused during the day, by the land getting more heated than the sea, consequently the air over it ascends, and the cool air from the sea flows over on the land to supply its place; and during night, by the temperature of the land falling below that of the sea, and the air becoming thereby heavier and denser, flows over the sea as a land-breeze. It is within the tropics where sea-breezes are most marked and constant, because there the sun's heat is greatest, and atmospheric pressure is practically uniform, except in those rare instances where it is disturbed by hurricanes. But in countries such as Great Britain, where atmospheric pressure is most commonly, to some extent, greater or less than that of surrounding regions, the strength of the wind blowing from the high to the low barometer is far stronger than that which would result from the disturbance caused by the unequal heating of land and water; and consequently the sea-breeze is not felt. In the warm months, however, when barometers are nearly equal over northern and western Europe, there is a gentle sea-breeze all round Great Britain during the heat of the day, and a land-breeze during night. Quite analogous to the land and sea breezes are the *Monsoons* (q. v.), which are only the north trades drawn out of their course in summer by the heated regions of Southern Asia—the south-west monsoon being only a vast sea-breeze blowing on Southern Asia, and continuing several months of the year.

VARIABLE WINDS.—These winds depend on purely local or temporary causes, such as the nature of the ground, covered with vegetation or bare; the physical configuration of the surface, level or mountainous; the vicinity of the sea or lakes; and the passage of storms. Within the tropics, all except the last of these is borne down by the great atmospheric currents, which prevail there in all their force. But in higher latitudes this is not the case; these, therefore, are the regions where variable winds prevail. The most noted of these winds are the *Simoom* (q. v.), *Sirocco*, *Solano*, and *Harmattan* (q. v.). The *Puna Winds* prevail for four months in the year in a high barren table-land in Peru called the *Puna*; as they are part of the south-east trade-wind, after having crossed the Andes they are drained of their moisture, and are consequently the most dry and parching winds that occur anywhere on the globe. In travelling over the *Puna* it is necessary to protect the face with a mask from the glare and heat of the day, and from the intense cold of the night. The *East Winds* which prevail in the British Islands in spring are part of the great polar current which at that season descends over Europe through Russia. Their origin explains their dryness and unhealthiness. It is a prevalent notion that the east winds in this country are damp. It is quite true that many easterly winds are peculiarly damp; all that prevail in the front part of Storms (q. v.) are very damp and rainy, they being simply an indraught of the air towards the low barometer which is advancing from the west at the time; and it is owing to this circumstance that in the east of Scotland the greater part of the annual rainfall falls with easterly winds. All of these damp easterly winds, however, soon shift round to some westerly point. But the genuine east wind, which is the dread of the nervous and of invalids, does not shift to the west, and is specially and intolerably dry. In the third week of May 1866 this character was strongly marked, when at many places in Scotland the humidity was only 40,

WINDAGE—WINDERMERE.

and on some occasions as low as 29; the degree of this dryness will be appreciated when it is stated that the driest month during eleven years ending with 1866, shewed a humidity only of 73, saturation being 100. While this wind lasted, the daily range of temperature was double the usual amount, the soil was parched, and the leaves of trees and plants were blackened and destroyed. Deaths from brain-diseases and consumption reach the maximum in Great Britain during the prevalence of east winds. The *Etesian Winds* are northerly winds which prevail in summer over the Mediterranean Sea. They are caused by the great heat of North Africa at this season, and consist in a general flow of the air of the cooler Mediterranean to the south, to take the place of the heated air which rises from the sandy deserts. The *Mistral* is a steady, violent north-west wind, felt particularly at Marseille and the south-east of France, blowing down on the Gulf of Lyons. The *Pampero* blows in the summer season from the Andes across the pampas of Buenos Ayres to the sea-coast. It is thus a north-west, or part of the anti-trade of the southern hemisphere, and so far analogous to the stormy winds which sweep over Europe from the south-west. But since it comes from the Andes over the South American continent, it is a dry wind, frequently darkening the sky with clouds of dust, and drying up vegetation.

Lord Bacon remarked that the wind most frequently veers with the sun's motion, or passes round the compass in the direction of N., N.E., E., S.E., S., S.W., W., and N.W., to N. This follows in consequence of the influence of the earth's rotation in changing the direction of the wind. Professor Dove of Berlin has the merit of having first propounded the *Law of the Rotation of the Winds*, and proved that the whole system of atmospheric currents—the constant, the periodical, and the variable winds—obey the influence of the earth's rotation.

WINDAGE, in a Gun, the difference in diameter between the bore of the piece and the projectile with which it is loaded. Formerly, a considerable

windage was allowed; but this only served to diminish the force of the explosion, and to give an irregular motion to the shot. In the present rifled artillery, it is sought to reduce the windage to a minimum, as $\cdot 01$ of an inch. Some windage is indispensable, or the shot would jam either going in or coming out.

WINDAGE (from cannon-balls), or **WIND CONTUSIONS**. Military surgeons so often meet with cases in which serious internal mischief (as, for instance, the rupture of the liver, concussion of the brain, or even a comminuted fracture of a bone) has been inflicted, without any external marks of violence to indicate its having resulted from the stroke of a cannon-ball, that they were led to the conclusion that solid objects projected with great velocity through the air might inflict such injuries indirectly by aerial percussion; the hurt being inflicted either directly by the force with which the air is driven against the part, or indirectly by the rush of air to refill the momentary vacuum created by the rapid passage of the ball. So many observations have, however, been made of cannon-balls passing close to the body (even shaving part of the head, tearing away portions of uniform, or carrying off the external ear or the end of the nose, without further mischief), that this hypothesis is totally untenable, and is now generally rejected. The true explanation of the cases formerly attributed to the windage of cannon-balls appears to rest, according to recent views, 'in the peculiar direction, the degree of obliquity with which the missile impinges on the elastic skin, together with the situation of the structures injured beneath the surface, relatively to the weight and momentum of the ball on one side, and hard resisting substances on the other.' See Longmore's article on 'Gun-shot Wounds' in Holmes's *System of Surgery*, vol. ii., pp. 18—20, where the subject is fully discussed.

WINDERMERE, **WINANDERMERE**, or **LAKE WINDER**, the largest lake in England, called, on account of the supposed superiority of

Lake Windermere, from Elleray.

its shores, in point of natural beauty, over those of the other lakes of North-western England, the 'Queen of the Lakes,' is partly in the county of Lancaster, and partly divides that county from Westmoreland. It is 11 miles long, and about 1 mile in extreme breadth, is fed by the Brathay and the Rothay, the waters of which become united before

entering the lake, and by the streams which drain the neighbouring lakelets of Esthwaite, Troutbeck, and Blelham, and discharges its surplus waters southward into Morecambe Bay by the Leven. Next to Wast Water, W. is the deepest of all the English lakes, its greatest depth being 240 feet, while Wast Water is 270 feet deep. It contains

a number of islands, the largest being 28 acres in superficial extent, and the chief of which are Rough Holm, House Holm, Lady Holm, and Curwen's or Belle Iala. Soft rich beauty is the principal characteristic of the islands of the lake, of the wooded shores, and of the scenery around; there being a total absence of that wildness and sublimity which characterises some of the other lakes, except at the north end, where Langdale Pikes, Harrison Stickle, Sca Fell, and Bow Fell stand forward prominently in the landscape. The east and west shores are bounded by gentle eminences exuberantly wooded, and numerous villas and cottages peeping out of the woods give an aspect of quiet domesticity to the landscape. About a mile from Waterhead, at the north extremity of the lake, is the town of Ambleside, $1\frac{1}{2}$ miles north-west of which is Rydal, the residence of the poet Wordsworth; in the vicinity of Waterhead is Dove's Nest, the cottage at one time occupied by Mrs Hemans; further down the east shore is Elleray, famous as the residence of 'Christopher North;' and half-way down the lake, on the eastern shore, is Bowness.

WINDGALLS are puffy swellings about the joints of animals, particularly of horses, correspond to the ganglions of human surgery, and result from irritation and inflammation being set up within the delicate synovial cavities, which thus secrete an unusual quantity of thickened synovia. Rest, moderate work, wet bandages, and occasional blisters reduce the swellings, but with fast roadwork they are apt to reappear, especially in old horses.

WINDHAM, RIGHT HON. WILLIAM, English statesman, born, 1750, in Golden Square, London, was son of Colonel Windham of Felbrigg Hall, Norfolk, in which county the family had been settled since the 12th century. He was educated at Eton, and was afterwards sent to Glasgow University, where he studied mathematics with success. In 1761, he entered at University College, Oxford. After the usual course of travel, he began to acquire notoriety as an opponent of the administration of Lord North. His oratorical exercises were interrupted by a design of visiting the North Pole, and he accompanied the expedition in which Nelson, then a youth, took part. He found the sea-sickness intolerable, was put on shore in Norway, and returned home in a Greenland whaler. In 1781, he was returned to parliament for Norwich, and took his seat among the Whigs. In 1783, on the formation of the Portland ministry, remarkable for the coalition of Lord North and Mr Fox, he became principal secretary to Lord Northampton, then lord-lieutenant of Ireland. Before leaving England, he called upon his friend Dr Johnson, and lamented that his situation would compel him to sanction practices he could not approve. 'Don't be afraid, sir,' replied the doctor, 'you will soon make a very pretty rascal.' Ill-health, or, perhaps, conscientious scruples, soon caused him to resign his secretaryship. In 1784, he seconded Burke's motion for a representation to the throne on the state of the nation. There is an admirable and characteristic sketch of W. in Macaulay's description of the trial of Warren Hastings: 'There, with eyes momentarily fixed on Burke, appeared the first gentleman of the age, his form developed by every manly exercise, his face beaming with intelligence and spirit—the ingenious, the chivalrous, the high-souled Windham.' Abandoning his old friends the Whigs, he followed Mr Burke, and ranged himself on the side of Mr Pitt in opposing the speculative doctrines of the French Revolution, and supporting the war with France. In 1794, he became secretary-at-war under Mr Pitt, with a seat in the cabinet.

He now attacked his former friends with the utmost acerbity. He went out with Pitt in 1801, and sided with the Grenvilles in stigmatising the peace of Amiens, concluded by the Addington administration in 1801. This lost him his seat for Norwich, but he was elected for St Mawes, and on the return of the Grenville party to power, he became colonial secretary. In 1806, he brought forward his plan of limited service in the army, proposing that the infantry should be enlisted for seven years only, with liberty to renew their services for another seven years, receiving an increase of pay; cavalry and artillery to be enlisted for ten years, the second period six, and the third five years. He also proposed to increase the pay and pensions of officers and men, and generally to better the condition of the soldier. The plan was strenuously opposed, but passed into a law. He went out of office in 1807, when the Portland administration was formed (having previously declined the offer of a peerage), and strongly denounced the expedition against Copenhagen, and afterwards the disastrous Walcheren Expedition. In 1808, a clause was introduced by Lord Castle-reagh (who had succeeded W. in office) into the Mutiny Act, permitting men to enlist for life, contrary to W.'s scheme of limited service, which was, however, re-adopted in 1847. In May, he underwent a surgical operation for extracting a tumour from his hip, from the effects of which he died June 3, 1810.

W. was an excellent speaker, and one of the most effective and skilful debaters of his time, as will appear from his speeches collected by Mr Amyott, his secretary, and published, with a Life prefixed, in 3 vols. 8vo. Fox said he had never met a meditating man with so much activity, or a reading man with so much practical knowledge. Pitt declared that his speeches were the finest productions possible of a warm imagination and fancy. Canning described his eloquence as, if not the most commanding, at least the most insinuating that was ever heard in the House of Commons. Dr Johnson, who was much attached to him, declared that, in the regions of literature, W. was *inter stellas luas minores*. He possessed brilliant conversational powers. Yet, notwithstanding his great talents and rare gifts, he appears in the page of history as the mere shadow of a man. In his lifetime, he gained the disparaging nickname of 'the weather-cock.' He was fond of paradox, and once defended bull-baiting in the House of Commons with great vivacity and ingenuity. Although a man of refinement and sensitiveness, he had a passion for pugilism, and was a regular attendant upon prize-fights. The publication of his *Diary from 1784 to 1810*, by Mrs Henry Baring (1866) discloses the secret of his weakness. Morbidly self-conscious, he was always watching himself, pulling himself to pieces, and recording the doubts that haunted him as to his mental capacity. Acknowledged by his contemporaries to be one of the meanest of men, he succeeded in infusing into his mind doubts with respect to his own courage. He got rid of this delusion by going under fire in the trenches at the siege of Valenciennes; but no sooner was he convinced that he was not a coward than he began to be afraid he was discreditably insensible to the scenes which were passing around him! With brilliant faculties, he was in fact an intellectual hypochondriac incapable of achieving anything great.

WIND-INSTRUMENTS, musical instruments of which the sounds are produced by the agitation of an enclosed column of air. They are generally classified into *wood instruments* and *brass instruments* (both of which are played by the breath), and the *organ*.

The name wood instruments is applied to musical instruments constructed either of wood or of ivory, of which the principal are the flute, piccolo, clarinet, flageolet, basset-horn, oboe, and bassoon. They are generally characterised by a soft, smooth, aerial tone, resembling the human voice. By the use of holes and keys, considerable compass is given to them; they are capable of producing only one sound at a time, but with considerable command of piano and forte. Of brass instruments the chief are the horn, trumpet, trombone, cornet-a-piston, euphonium, bombardon, and ophicleide. They are generally more powerful, and their quality more piercing than wood instruments; the ophicleide, however, approaching more than the rest to wood instruments in capabilities and tone. In a full orchestra there are generally two flutes, two oboes, two clarinets, two or four horns, and two bassoons, frequently with the addition of two basset-horns, one or two piccolos, and one or two ophicleides or trombones. Each part, except when there is an unusually large number of bow-instruments, is single.

The organ is a combination of a large number of wind-instruments, sounded, not by the breath, but by the admission of air into the wind-chest, by means of keys pressed down by the performer.

WINDLASS is that modification of the wheel and axle which is employed in raising weights, such as bucketful of water from a well, coals from a pit, &c. Its simplest form is that of an axle supported by pivots on two strong upright pieces, and pierced near one end with four or six square holes,

Fig. 1.—Ship's Windlass.

into which handles, known as *handspikes*, are inserted. In other forms, a winch at each end is substituted for the handspikes. If the weight (say a bucket of water) is to be lifted a considerable distance, the length of the rope which attaches it to the axle largely increases the weight, and thus aids the power when descending, and counteracts it when ascending. This difficulty is partially got over by employing a double rope with two buckets, one of which ascends while the other descends; but this modification, though partially effective for the end in view, lends aid to the power when aid is least, and hinders it when aid is most, required. A more efficacious plan is to form the axle not cylindrical, but of a barrel-shape, like two truncated cones placed base to base, and to fasten two ropes, one to each end, so that when coiled up round the barrel they approach the middle; in this case, when one rope is fully uncoiled, and winding-up commences, the gross weight, which is then at its maximum, acts at the minimum leverage of the end, and as the progress in winding up diminishes the weight, its leverage so increases that the momentum is preserved uniform. On the other hand, the empty bucket, when commencing its descent, acts at its greatest leverage, and as the unwinding of the rope adds to the weight, its

leverage becomes smaller, so that the momentum of the descending weight always remains the same; and thus the strain on the power is preserved uniform. The ratio of the weight to the power it is sometimes found necessary to increase greatly; but with the ordinary windlass this could only be affected by similarly increasing the ratio between the leverage of the handle and the radius of the axle—an object attained by a great increase of the former, rendering the machine too cumbrous, or by greatly diminishing the latter, and so weakening it. The desired result is attained, however, in a manner not liable to these objections, by the use of the *differential axle* (fig. 2),

an axle of which one half is of greater diameter than the other, and the single rope, after being coiled round the whole axle from end to end, is fastened at each end of the axle, and the weight is hung by a pulley, which is supported in a bulge in the centre of the rope. As the portion of the rope on one half of the axle is unwound, that on the other half is wound up; but since the rates of winding and unwinding are different, the bulge of the rope increases when the rope is wound on the smaller end of the axle, and decreases when it is wound off the smaller end. The more nearly equal the two radii of the axle are, the greater is the weight which can be raised by the power—the ratio between the two being

$$W = \frac{P}{P - \text{difference of radii of the portions of the axle}}$$
 so that if the radius of the power is 18 inches, and the radii of the axle 5 and 4 inches, the power balances a weight = 18 times itself; while the strength of the axle requires to be only equal to that of one of the ordinary kind, in which the power can only balance a weight = $4\frac{1}{2}$ times itself. The same principle is applied to the Screw (q. v.). For a very accurate estimate of the mechanical advantage of the windlass, the thickness of the rope must be taken into account, by adding half of its diameter to the radius of the axle.

Fig. 2.

WINDMILL is a mill for grinding corn, sawing wood, or performing any other species of work for which fixed machinery can be employed, the motive-power being the force of the wind acting on a set of sails in a manner similar to that of a current of water impinging obliquely on the float-boards of a water-wheel. The structure is a conical or pyramidal tower of considerable height, and covered over at the top with a species of dome, *aaa* (fig. 1), which is so fastened as to revolve upon it round the upper extremity of the shaft *c*, as a centre, the motion being aided by the interposition of 'castors' between the wooden rings which form respectively the base of the dome and the top of the tower; the sails, *b, b*, are attached to the extremity of the axis *d*, so as to revolve in a plane at right angles to it, and the motion they communicate to the axis is transferred by the bevelled wheels *e* and *f* to the upright shaft *c*, by which it is in turn conveyed to the working machinery at the bottom of the tower. The axis *d* of the sails, which is inclined at an angle of about 10° to the horizontal, is fixed at one end to a projection from the top of the shaft *c*, and at the other to a circular orifice in the side of the dome, so that it revolves with the latter, carrying the sails along with it; this arrangement is adopted for the

WINDMILL—WINDOW.

purpose of enabling the plane of rotation of the sails to be placed always at right angles to the direction of the wind. This transference of the plane of rotation was at one time effected by manual labour

Fig. 1.

applied to a winch at the bottom of the tower, the rotation being communicated, by an endless band and wheel-work above, to the dome, the outer circumference of the base of which, was, for this purpose, furnished with a circle of rack-work. But this clumsy arrangement was superseded in English windmills by an ingenious contrivance due to Sir William Cubitt, by which the wind itself was made to turn the sails into their proper position. The apparatus by which this is effected consists of a revolving *flyer* or fan, *g*, projecting from a gallery fastened to the dome on the side opposite to the sails; *h*, a long thin shaft to which a revolving motion is communicated by a toothed wheel on its outer extremity, from a corresponding wheel on the axis of the flyer (these wheels are not seen in the fig., being behind the flyer);

Fig. 2.

a pinion at the other end of the shaft acts upon the cog-wheel *k*, which carries, on the lower extremity of its axis, a pinion *l*; and this last can, at pleasure, be put into gearing with the rack-work or cog-circle on the lower edge of the dome. The construction of the sails, which are four in number, is shewn in fig. 2. Each sail consists of a *whip* or radius of from 33 to 40 feet in length, firmly fastened at right angles to the sail-axis, and pierced at from $\frac{1}{4}$ th or $\frac{1}{5}$ th of its length from the axle to its extremity with about 20 holes, into each of which is inserted a cross-bar of 5–6 feet in length; and this framework, strengthened generally by light rods connecting the ends of the cross-bars, is then covered with canvas. The cross-bars, however, are not, as in the figure, set in the plane of revolution of the whips, for, in that case, the wind, acting in a direction coinciding with that of the sail-axis, would impinge perpendicularly on the sails, and no rotatory motion would result; the bars, therefore, are set at an angle to this perpendicular direction, yet not all at the same angle, for the velocity of each point of the sail increasing with its distance from the sail-axis, the inclination must vary from the first cross-bar to the outer extremity. It is found that a variation of the angle from 18°, at the first cross-bar, to 7° at the extremity, is a very effective form. The amount of sail that a windmill can carry with advantage is limited, according to

Mr Smeaton (q. v.), one of the great authorities on this subject, to $\frac{1}{3}$ ths of the area of the circle described by one whip; the velocities of a sail, when unconnected with, and when producing its maximum effect on the machinery below, are as 3 to 2; also, the increase of useful effect varies with the square of the wind's velocity, and is proportional to the cube of the length of the whip, in sails of similar form. A windmill with sails of 40 feet radius is equivalent to 65,000 foot-pounds per minute. Another species of windmill, known as a horizontal windmill, is a large circular frame of wood which rotates on a vertical axis, and carries a set of sails which revolve in a horizontal plane. This form is, however, not nearly so effective as the other, it being evident that the wind can only act effectively on one sail at a time. According to Sir David Brewster, the power of a horizontal mill is only about one-third or one-fourth of that of a vertical mill, the number and size of the sails being equal in each. An ingenious form of horizontal windmill was patented by Mr Giraudat of New York in 1861. The peculiarity is in the sails, which are hinged in such a way that the force of the wind acting on one face of them preserves their perpendicularity to it, and secures a maximum effect, but when, after a further semi-revolution, the other side is presented to the wind, they are raised to a horizontal position. Most of the recent improvements in windmills have had for their object the regulation of the sail-area exposed to the wind to counterbalance the variations in the latter's force, and so produce uniformity of motion; but these are too numerous to be here noticed. We may mention, however, that the inventions, with this object, of Mr Bywater in England, M. Berton in France, and Mr Henry Glover of Massachusetts, are both ingenious and effective. Windmills were introduced into Europe from the Saracens, and were formerly much more extensively used in England than now. They are, however, still common in the midland and southern districts; on the continent, especially in Holland and France; and in the United States.

WINDOW (connected with *wind*, as Lat. *fenestra* with *ventus*) is an opening in the wall of a building for the admission of light and air. In the East, from time immemorial, windows open not upon the street, but upon the court, and are usually provided with lattices or jalousies. The Chinese use, instead of window-glass, a thin stuff varnished with shining lac, polished oyster shells, and thin plates of horn. Among the Romans, windows were originally closed with shutters; afterwards they were made of a transparent stone, *lapis specularis*, which, from the description, can be nothing else than mica; and in the 2d c. after Christ, of horn. According to some, there are traces of glass windows having been used in Pompeii; but the matter is doubtful. The first indisputable mention of glass windows is made by Gregory of Tours in the 4th c. of our era, who speaks of church windows of coloured glass. Wilfrid (q. v.), on succeeding to the archbishopric of York in 669, filled the vacant windows of the cathedral with glass. In 674, Abbot Benedict Biscep brought artists from France to glaze the windows of the Abbey of Weremouth; and the Bishop of Worcester did the same in 726. Leo III., in the end of the 8th c., put glass windows into the church of the Lateran. Glass began to be used in windows of private houses in England as early as 1180; in France in the 14th century. As late as 1458, it struck Æneas Sylvius very much that in Vienna most of the windows were glazed. See GLASS.

In ancient temple architecture, windows were unknown—the light being obtained from openings in the roof. In Gothic architecture, however, the

WINDOW—WINDSOR.

window is one of the most important features, giving, by the infinite variety of its outline, and the graceful forms of its tracery, as much character and beauty to the Gothic edifices, as the styles and colonnades of ancient art gave to the classic temples.

In the early Gothic or Norman style, the windows were small and comparatively stunted—they were either simple openings with semicircular head, or two such grouped together with a larger arch over

Fig. 1.—Bucknell, Oxford.

both, and with the usual mouldings and ornaments of the style (fig. 1). The inside had generally a deep splay, and simple moulding on the outside. Small circular windows sometimes occur in Norman work.

In the early English style, the windows were more elongated, and had pointed arches. They are frequently grouped in twos or threes, and placed so close, that the wall between becomes a mullion. The wall over the group contained within the enclosing arch, then becomes perforated with a quatrefoil or other ornamental opening, and thus

Fig. 2.—Little St Mary, Cambridge, circa 1350.

the simpler forms of tracery become introduced. The interior arches are splayed off, and are frequently very elaborately decorated with shafts and

arch mouldings. The lancet window (so called from its shape) is common in this style. Circular windows are also used with tracery formed by little radiating shafts with small arches. The triangular window, on a small scale, is also occasionally to be met with.

It is in the Decorated style that the windows become enlarged and filled with mullions and tracery. This is at first simple, and composed of geometric figures such as the origin and progress of Tracery (q. v.) naturally led to. As the style advanced, more flowing forms were introduced, until, in the 15th c., the tracery passed into the Perpendicular Style (q. v.) in England, and into the Flamboyant (q. v.) in France. The heads of the lights, and the apertures in the tracery, are usually foiled, and the inner jambs are splayed and ornamented with mouldings, shafts, &c. (fig. 2). In elaborately traceried windows, the jamb and arch mouldings are occasionally very small, but they are usually bold and deep.

In the later Tudor style, the window-heads became flattened into the four-centre arch; and in the time of Elizabeth and James I., the arch gave place altogether to the flat lintel with the opening divided by mullions into rectangular lights, sometimes foiled at top. Circular windows, with elaborate tracery, are chiefly found in the Decorated period.

In domestic buildings, the windows are similar to the above, but square-headed windows occur more frequently to suit the height of the floors; and the space between the sill and the floor is recessed and fitted with seats. Transoms are also of common occurrence. The Bow or Bay Window (q. v.) is also a frequent and very elegant feature in the later Gothic buildings.

In the revived Classic styles, the windows are almost invariably plain rectangular openings, with either a flat lintel or semicircular arch-head. They have sometimes architraves round the jambs and lintel, or are ornamented with pillars supporting an entablature or pediment above. The architraves are frequently carved, and the cornices carried on trusses at each side.

The style of shop-fronts has been much modified, and the windows enlarged, in consequence of the facilities afforded by the use of plate-glass.

WINDSOR, properly called **NEW WINDSOR**, a municipal and parliamentary borough of Berkshire, beautifully situated on the right bank of the Thames, 23 miles west-south-west of London. W. and Eton in reality form one town. The town is chiefly interesting on account of its being the scene of *The Merry Wives of Windsor*, and the antiquity of its castle and parks, which have been a favourite residence of English monarchs, especially since the time of William the Conqueror. The elevated plateau of natural chalk upon which it stands marked it out, no doubt, as a naturally strong place from the earliest dates, but the deficiency of water which such a position entailed, was a serious objection to its being adopted as a permanent residence for many years. The older palace of the English kings was at *Old Windsor*, about two miles distant, and considerable doubt seems to exist among antiquaries and historians as to the first English king who built solid work of masonry at Windsor Castle. In the time of Edward the Confessor it was probably a wooden structure, as stone was difficult to be had, and wood was abundant. William the Conqueror probably built the first substantial stone buildings, and regularly fortified the place; but the absence of water, except what was carried to it from the Thames, must have for a long time been a serious drawback to its importance as a military station. The history of the existing fabric begins in the reign of Henry

III. The buildings may be said to be grouped in three portions—the Middle Ward containing the Round Tower; the Lower Ward, on the west, containing St George's Chapel, the houses of the Military Knights, cloisters, &c.; and the Upper Ward, on the east, containing the sovereign's private apartments. The unfinished chapel, which was begun by Henry III., was completed by Edward III., rebuilt by Henry VII., and added to by Cardinal Wolsey. Under this chapel is the burial vault of the present royal family. The Round Tower, formerly believed to be Norman, but in which there is not a single yard of Norman masonry, was built in the 18th year of Edward III. to receive the Round Table of the knights of the newly founded order of the Garter. Pop. (1861) 9520. The park and forest immediately adjoining are 13,000 acres in extent, and contain many historic trees, such as Elizabeth's Oak; Shakspeare's Oak; the Long Walk, made in the reign of Charles II.; and Queen Anne's Ride of Elms, three miles long. Herne's Oak, rendered so famous by Shakspeare, was blown down in September 1863, and a stone and young tree now mark the spot. The oldest planted timber in England, viz. that of the reign of Elizabeth, is also in Windsor Park, and there are many oaks of which, from various reasons, it is well established the age must be 1000 years.—See *Saturday Review*, August 11, 1866; Tighe's *Annals of Windsor*; Menzies' *History of Windsor Forest and Parks*.

WINE, CHEMISTRY AND MANUFACTURE OF. Before entering into the chemistry of this subject, it is necessary that the composition of the grape, from whose juice it is derived, should be understood; and as there is an immense variety of vines yielding grapes of corresponding variety, and as the same variety* will, under different external influences, produce very different grapes, it is obvious that our researches must be confined to the most typical form of grapes. The principal component of the juice of ripe grapes is water, in which are various substances, either held in solution or very minutely divided. The juice as obtained by pressure, is thick, and exposure to the heat of the sun rapidly changes it into a fermented liquid. As principal components held in solution in the water, Professor Mulder mentions 'sugar (both grape-sugar and fruit-sugar), gelatine or pectine; gum, fat, wax, vegetable albumen, vegetable gluten, and some other substances of the nature of extractive matters, which are not, however, accurately determined; tartaric acid, both free and combined with potash (as cream of tartar), partly also combined with lime; in some cases, we find also racemic acid, malic acid, partly quite free, partly combined with lime, and, according to some, tartrate of potash and alumina; further, oxide of manganese and oxide of iron, sulphate of potash, common salt, phosphate of lime, magnesia, and silicic acid may also exist.'—*Chemistry of Wine*, p. 5. Although no other ingredients have as yet been discovered in grape-juice, others, which only appear during fermentation, and impart not only the vinous smell common to all wines, but the aroma (bouquet) and the flavour peculiar to each wine, must exist in it in small quantities. In those cases where the skins are allowed, as in the preparation of red wine, to ferment with the juice, the constituents imparting odour and flavour may be drawn from

them. Colouring matter and tannic acid are undoubtedly found in the skin, and are thus imparted to red wines. Moreover, the grape-stones, which are left with the skins, yield tannic acid freely during fermentation. The different proportions in which the inorganic matters—the potash, soda, lime, magnesia, iron, manganese, sulphuric acid, phosphoric acid, and chlorine—exist in grape-juice, exert a very great influence upon the quality of the wine, both in relation to its colour and its taste. A relative excess of phosphoric acid, or of lime, or of soda, will induce changes sufficiently obvious to the chemist, but which we have not space to discuss. With regard to the acids of grape-juice, or *must*, as it is technically called, Professor Mulder observes that, as a general rule, the three—viz., tartaric, malic, and citric—are rarely found together in one fruit, and he doubts whether the presence of citric acid has been fully proved. Malic acid exists in unripe, and tartaric acid in ripe grapes; and while no malic acid exists in wine made from perfectly ripe grapes, a small quantity is present in most wines. In the article TARTARIC ACID, it is shewn that a nearly allied acid, *racemic acid*, exists in exceptional cases in grapes. The quality of wine is only affected if this acid be largely present, because less lime than usual will be found in it, racemate of lime being less soluble than tartrate of lime, and further, because cream of tartar is more soluble than biracemate of potash. Such wines are consequently sweeter, and—if red wines—darker coloured, than wines containing only tartaric acid. The quantity of sugar varies extremely. In the juice of very ripe grapes, it may reach 40 per cent. According to Fontenelle, the juice produced in the south of France contains from 30 to 18 per cent; while in the neighbourhood of Stuttgart, Reuss determines it at from 25 to 13 per cent. In the low and variable temperature of Holland, the juice of the best grapes yields only 10 or 12 per cent of sugar. The composition of the albuminous matter is not clearly determined. In an analysis of the must of the Riessling grapes of Grumbach, Beltz found that the gluten (no albumen was found) was thirty times less abundant than the sugar. It probably varies at from 1 to $\frac{1}{4}$ per cent. The only other ingredient requiring notice is fat, which is chiefly but not entirely derived from the grape-stones, in which it is an abundant ingredient. It occurs in wine, in minute quantity, in the form of a fatty acid.

On the subject of the fermentation of the grape-juice we shall only offer a few remarks. It has been already stated that the saccharine contents of grape-juice range from 13 to 30 per cent. If we regard all this sugar as grape-sugar, $C_{12}H_{22}O_{11}$, with an equivalent of 180, then each atom may be resolved into 2 atoms of alcohol, C_2H_5O , with an equivalent of 46, and 4 of carbonic acid gas, CO_2 , with an equivalent of 22, according to the equation—

provided that there is no loss; or under the most favourable conditions of fermentation, 180 parts (by weight) of anhydrous grape-sugar, or 198 of the hydrated sugar (with the formula, $C_{12}H_{24}O_{14}$), may yield 92 parts of alcohol; or, roughly speaking, 2 parts of sugar yield 1 of alcohol. 'According to this,' says Mulder, 'the juice of French and German grapes gives, when analysed, as a maximum, from 7 to 15 per cent of alcohol by weight. But some of the sugar remains undissolved, and, during fermentation, more alcohol is evaporated than water; therefore, for such grape-juice, or rather for the wine

* A certain variety of grape, when grown upon the Rhine, furnishes a species of Hock; the same grape, when raised in the valley of the Tagus, yields Bucellas; whilst in the island of Madeira it produces the wine known as Sercial, which has a flavour quite different from either of the others. See Miller's *Organic Chemistry*, 3d ed. p. 187.

to be produced from it, the alcoholic contents must be under 15 per cent. as maximum, and 7 per cent. as minimum.—*Op. cit.*, pp. 49, 50. According to Mulder, sugar is found in all wine,* and its quantity depends to a considerable extent upon the treatment to which the grapes are subjected before pressure. Tokay wine, for example, is prepared from grapes which have been allowed not only to get over-ripe, but partly to dry on the vines; *vin de paille* is obtained from grapes dried on straw exposed to the sun; and in both these cases, water is evaporated, and the concentrated juice yields a wine of extra strength. The strong heavy wines used by the ancients were thus prepared. When the grapes are dried on the vine, the wine is called *vin sec*; and when the juice has been evaporated by the aid of heat, the wine is called *vin cotti*.

In consequence of the close connection which exists between the amount of sugar in the grape-juice and the excellence of the wine which it yields, attempts are often made, especially in bad seasons (want of heat and light, and excess of rain), to introduce extraneous sugar into the juice; or, as it is technically called, to *doctor* it. For this purpose, a cheap fermentable sugar is added to the sour juice, an adulteration which cannot subsequently be detected by chemistry, although it may be suspected, from the absence of the proper aroma from the wine. Similarly, sugar is often added to good grape-juice, in order to obtain a stronger wine than the natural product. Many imitations of Port wine are thus manufactured. The character of the wine is much influenced by the extent to which the process of fermentation is allowed to proceed. If it goes on till all the sugar is converted into alcohol, a *dry* wine is produced; when it is checked before the change is completed, a rich *fruity* wine is produced; and when the wine is bottled whilst the fermentation is still in progress, effervescent wine is formed.

Shortly after the must has passed from the wine-press, symptoms of fermentation appear; the juice becomes more turbid, bubbles rise to the surface, and a froth soon settles there. This process in a moderate climate usually reaches its highest point in three or four days; and before it is quite finished, the whole liquid mass is stirred up so as to re-excite the process. For this purpose, in many districts, a naked man used (we do not know if the custom generally still exists) to go into the wine-tub, who both accomplished the necessary stirring, and promoted fermentation by his animal heat. Several persons have been killed in this way by suffocation from the atmosphere of carbonic acid gas. In two or three weeks, the fluid becomes comparatively clear, and a precipitate forms at the bottom. The wine is now removed from the sediment into another vessel, and a slow form of fermentation—*after-fermentation*, as it is termed—goes on for several months, sugar being constantly converted into alcohol and carbonic acid, and a fresh precipitate forming at the bottom. Several similar changes into other vessels are made, to get rid of the sediment, till it is fit for transferring into casks. That the process of fermentation may go on satisfactorily, not only must water, sugar, and a nitrogenous matter in a state of actual change be present, but there must be a certain temperature and a certain amount of atmospheric air present. 'Although,' says Mulder, 'there is a wide interval between the

extremes of temperature at which fermentation is possible, the boundary is very narrow which limits good and active fermentation in every kind of wine. The grapes of each country ripened under different degrees of summer warmth, and very unequally rich in constituents, require very different temperatures during fermentation; and different temperatures are also required for grapes which are the product of a warmer or a colder summer. But on these points we have little accurate knowledge. All we know is, that a high temperature during autumn promotes fermentation, and a low one is detrimental to it; and that inequality of temperature during fermentation is extremely injurious, and not unfrequently spoils the wine altogether.—*Op. cit.*, p. 61. To what extent it is expedient to admit atmospheric air to the must, so that the fermentation may go on most favourably, is a point regarding which there has been much discussion, and which is not definitely settled. While some have asserted that no air is necessary to the development of fermentation, others have maintained that the wine is improved by the free admission of air during fermentation. Gay-Lussac proved experimentally that air is essential to initiate fermentation, which would then be continued without any fresh supply; and for many years wine was made in France with an almost total exclusion of air from the fluid by an arrangement intended to prevent the escape of alcohol by evaporation; but when the same chemist proved that by the use of open vats scarcely $\frac{1}{100}$ th part of the alcohol was lost, this arrangement fell into disuse. Judging from the method of preparing Bavarian beer, in which air is allowed to enter freely, Liebig recommended the same in the case of wine, and suggested that a large opening should be made in the casks in which fermentation takes place. This method has been tried on a large scale by Von Babo, Crasso, and others, with red wine, which was found to be of a better quality than that which underwent the same process in a cask which was closed, and only provided with a glass tube for the escape of the carbonic acid. But in other experiments made with white wine, the wine in open casks appeared to lose in aroma; and hence the solution of this question apparently depends on the kind of wine. Liebig's opinion has been very fiercely, and, as Mulder thinks, unfairly attacked; the probability is, that wines containing much sugar may be allowed with advantage to ferment in closed vessels, while those less rich in that substance may be left in open casks, provided the temperature be low and equable. When the main object is to increase the quantity of alcohol, the admission of much air is injurious, since it promotes the formation of acetic acid, and causes a corresponding loss of alcohol.

The actual substance—*ferment*—which causes the breaking-up of sugar into alcohol and carbonic acid, has been submitted to careful chemical and microscopical examination. One hundred parts of sugar require about 1.5 parts of ferment reckoned in the dry state; and as the analysis of ferment shews that about half of it consists of albuminous matter, it follows that $\frac{3}{4}$ of a part of albuminous matter are required for the conversion of 100 parts of sugar into alcohol and carbonic acid. Ferment consists of cells or globules of *Torula* (q. v.), which are precisely the same in the production of wine and beer. It is the contents of these cells which contain the active albuminous matter; while the cell-wall, consisting of cellulose, $C_{12}H_{10}O_{10}$, and produced from gum or vegetable mucus, is inert.

The leading points in which the constituents of grape-juice and those of wine differ from one another in consequence of fermentation, are, that in the

* Dr Bence Jones, in the Appendix to his translation of Mulder's work, declares, on the other hand, that while Port, Sherry (except in two instances), Madeira, and Champagne always contain sugar; Claret, Burgundy, Rhine, and Moselle wine (excepting one sample of Sauterne) are always free from every kind of sugar.

wine there is a diminution (1) of the mucilaginous and saccharine matters, in consequence of the formation of ferment and alcohol; (2) of those substances which are insoluble in common water, but are held in solution in the viscid must, as, for example, phosphate and sulphate of lime; and (3) of cream of tartar, tartrate of magnesia, and sulphate of potash, which, being less soluble in spirit than in water, fall as the formation of alcohol increases. Red wines lose a portion of colouring matter and of the tannin, which is withdrawn by these salts, and hence become of a lighter colour and less astringent. Before noticing the alcoholic strength of different wines, we shall briefly describe the concluding steps necessary for rendering wine fit for use. The process of *clearing* is undertaken with the view of removing all the sediment in which albuminous matters may still occur, and of diminishing the colouring matter and tannin of red wines. Amongst the substances used for these purposes may be mentioned albumen, isinglass, gum, milk, lime, gypsum, &c. In warm countries, gum is preferable to albumen or isinglass. The addition of lime throws down a precipitate of salts of lime, which carries down, in the case of red wine, a considerable quantity of colouring matter; its addition gives a sweeter and less astringent taste to the wine, and an appearance of age. As a general rule, clearing increases the durability of wine. *Sulphurising* is a process which is especially applied to sweet white wines, which possess an excess of sugar and albuminous matter, and little tannic acid, and thus become easily decomposed. Its object is to check undue fermentation, and to prevent the formation of mould, which afterwards imparts a musty taste to the wine. The process is effected by burning sulphur in bottles or casks, and instantly pouring in the wine, which absorbs the sulphurous acid. Wine intended for exportation to warm climates is usually strongly sulphurised. Of course, great care must be taken that the sulphur is free from its common impurity, arsenic. In place of sulphurising, another method of hindering the fermentation of sweet wine is adopted in some parts of France; it consists in putting $\frac{1}{100}$ th part of powdered mustard into the wine; but how it acts is unknown.

Having traced the chemical history of wine from its original state of grape-juice to the time when, having been clarified, and poured into casks and bottles, it is fit for use, we ought, in order to complete the sketch, to notice the subsequent changes which, in the course of time, it undergoes in the cellar. The ages at which different wines attain their perfection are, as is well known, extremely different. 'As a general rule,' says Mulder, 'wines which have retained a considerable portion of albuminous matter, and possess but little tannic acid, cannot resist the influence of time; they become acid, or undergo some other change. This occurs in the case of Rhine wines, which contain but little alcohol; and all those wines which contain much sugar, or but little tannic acid, cannot be kept long. Wines which can be *cellared* are those which improve; or, to speak more correctly, those wines are stored which improve with age. In these, odoriferous substances are formed, and the wine becomes less acid and better tasted. Such wine as is coloured often deposits a considerable amount of sediment; and if it be stored in casks, there is a constant increase of alcohol.'—*Op. cit.*, pp. 105, 106. Wine is improved by being kept in wooden casks, as water escapes by evaporation, and the other constituents are relatively increased. The vinous constituents being thus concentrated, exert a stronger chemical action upon each other, and render the wine not only stronger, but better flavoured. The change, how-

ever, does not stop here. The loss of water must be replaced by the addition of wine, otherwise the action of the air would turn the wine sour, and convert the alcohol into acetic acid; and the diminution of water, which is thus replaced by wine, causes a constant increase of tartaric acid. Wines which are poor in sugar may thus soon become too sour; and consequently, all wines cannot undergo this process. The popular idea, that wine which has grown old in bottles has therefore become richer in alcohol, is altogether false, and is doubtless founded on the fact, that it is only the strongest wines that can be preserved. The colour, however, of bottled wine is materially affected by age: liqueur-wines and red wines containing no large amount of tannic acid, becoming darker, while wines which are rich in tannic acid, as Port, for example, deposit a sediment, and become lighter. Old bottled wines contain odoriferous constituents—ethers of various organic acids—which are not found in new wine. For an explanation of the mode of formation of these compounds, to which wine owes its *aroma*, we must refer to the chapter on 'The Odoriferous Constituents of Wine,' in Mulder's work; we will here merely remark, that diminution of the free acids is necessarily associated with the formation of these compounds, and that this diminution can only occur by the acids being either decomposed or combined with non-acid substances, both of which operations here take place as the result of a very slow chemical process. This effect of time may, however, be imitated by art; and if bottles corked, but not quite filled with wine, are placed for two hours in warm water at a temperature of 185°, and after cooling, are filled, their contents possess the flavour and aroma of wine that has been bottled several years. This result was originally obtained by Appert; but Pasteur and others have, during the last few years, again brought the subject before the French Academy. Wines which have been long in bottle sometimes acquire a peculiar flavour, which is incorrectly referred to the cork. It is in reality due to the peculiar mould which grows from the outside of the cork inwards; and should it reach the inner surface, it imparts to the contents of the bottle a peculiar taste; and this wine is said to be *corked*. Very similar to this is what is known as 'the taste of the cask,' a peculiar flavour sometimes acquired by wine before bottling. This flavour is regarded as dependent on the development of a peculiar essential oil, during the growth of 'mould,' on the surface of the wine. It can be removed by the addition to each pipe of about a quart of olive oil, which dissolves the unpleasant flavouring matter, and carries it to the surface.

In submitting matured wines to chemical analysis it is found that they differ materially from one another in their composition; and especially as the wine is, or is not, red. In white wine, no special colouring matters are found, and only a trace of tannic acid; while in red wine, both are present. In wine generally, the principal ingredients are alcohol and water; then sugar, gum, extractive and albuminous matters; then free organic acids, such as tartaric, racemic, malic, and acetic acid; and salts, such as the tartrates of potash, of lime, and of magnesia, sulphate of potash, chloride of sodium, and traces of phosphate of lime; also, especially in old wines, substances imparting aroma, as cenanthic and acetic ethers, and other volatile odoriferous matters (amongst which Mulder mentions butyric and caprylic ethers, each having a pine-apple odour, caproic, pelargonic, capric, and propionic ethers, amylic alcohol, and many of its ethers and other compounds, aldehyde, acetal, and probably racemic, citric, and malic ethers). In red wines, and in many

WINE.

others, a little iron, and possibly some alumina, may be found; and lastly, the best wines contain, according to Fauré, a peculiar matter, which he terms *ozanthin*, and to which he ascribes the substance or body of the wine; but which seems to other chemists scarcely to differ from gum or dextrine. These ingredients, as Mulder observes, vary exceedingly in proportion. The quantity of some is so small that the substance almost disappears during analysis; others can just be determined by a delicate balance; while others, again, are freely present. Putting aside taste and smell as standards of comparison, most of the essential dietetic and therapeutic properties of wine depend upon the *alcohol, sugar, and free acids*, especially *tartaric acid*, contained in it. In his chapter on 'The Amount of Alcohol in Wine,' Mulder gives a large number of analyses of different wines in which the percentage of alcohol is determined. We shall here only give the abstract of the analyses made by his translator, Dr Bence Jones, who found that the alcohol varies in

Sugar is found in all wines,* although in certain kinds very little exists. According to Fresenius, the sugar in four kinds of Rhine wine amounts to exactly six-sevenths of the extract remaining after evaporation, the seventh part consisting of the salts and non-volatile unfermentable matter. In red Bordeaux, on the other hand, very little sugar is found; red Sauterne contains less than 1 per cent. of extract, and Hermitage 1.7; hence the quantity of sugar must be very minute; while some kinds of Muscat yield 24.5 of an extract, containing about 22 per cent. of sugar. Small as is the quantity of sugar in some wines, it is of great importance in diminishing the sharp taste of the free acids, and in imparting an agreeable flavour to the wine. Good red wines should contain at least one-half per cent. of sugar, and the quantity is sometimes larger. Some of the sweet wines contain nearly one-fourth of their weight of saccharine matter.

The following results were yielded by the experiments of Dr Bence Jones:

| | |

| Cyprus, | " " 103 " |

Under the term 'free acids' are included the acid tartrate of potash, known as cream of tartar, and other soluble bitartrates found in wine, besides such acids as are quite uncombined, such as tartaric, malic, and acetic acid, and a trace of free tannic acid. Sugar has so much power in concealing the free acids, that their amount cannot be estimated with any certainty by the flavour of the wine, and must be estimated chemically by ascertaining how much of an alkaline solution of given strength must be used

* In the preceding foot-note we have mentioned that Dr Bence Jones denies the accuracy of this statement.

in order to render a given quantity of wine perfectly neutral to test-paper. Volatile acids, as, for example, acetic acid, may either be determined separately, or included with the others; and, excepting this acid, all the other acids occurring in wine may practically be calculated as tartaric acid. Mulder found that acetic acid was present in 20 different kinds of wine which he examined, the amount of the anhydrous acid ranging from 1.75 thousandth parts in Madeira to 0.25 thousandth parts in Tavella. In the same 20 kinds of wines, the free tartaric acid ranged from 2 to 7 parts in 1000 of wine, Tavella having the largest, and Bordeaux Sauterne the smallest quantity. With regard to the tannic acid, traces of it may be found in all white wines, but in no white wine is it sufficiently abundant to be of the slightest importance in a medical or dietetic point of view. On the other hand, it is abundant in Port and heavily loaded Bordeaux wines, especially when new. In the course of time, this tannic acid becomes oxidised into a sparingly soluble compound, which is called by Berzelius the *apothema*, or precipitate of tannic acid—a process which is facilitated by the exposure of the wine in bottles to full daylight. There is no doubt that this acid, by combining with the albuminous matters, tends to increase the durability of these wines. Dr Bence Jones, in his Appendix to Mulder's treatise, gives numerous results of experiments made regarding the acidity of wines by Prout, Liebig, Fresenius, and himself. His general conclusions are, that, 'proceeding from the least acid wine to the most acid, we have Sherry, Port, Champagne, Claret, Madeira, Burgundy, Rhine wine, Moselle. The least acid fluids examined were Geneva and whisky; then rum, brandy, ale, porter, stout: the wines were all more acid than the malt liquids.' Mr Griffin has made 22 determinations of the acidity of light wines for Dr Druitt, which are published at the end of that physician's instructive little work on *Cheap Wines*, and has subsequently published an independent volume on the mode of determining the acidity of wines.

In conclusion, we may say a word or two on 'the diseases of wine,' by which term we understand those conditions in which the wine has become so altered and unfitted for use as to have lost its distinct character. The most important of these diseases are:

1. *The Turning of Wine*.—This disease is incidental to young wine, and seems to occur under special conditions of the weather. The colour becomes darker, and the taste first disappears, and if the disease goes on, becomes disagreeable; the wine becomes turbid and acid. This disease is caused by a decomposition of tartar.

2. *The Ropiness of Wine*.—This disease consists in the formation of vegetable mucus from the sugar of the wine, and is known as mucous fermentation. The wines liable to this change are those which are deficient in tannic acid.

3. *The Bitterness of Wine*.—to which Burgundy wines are especially exposed—seems due to a second fermentation, inasmuch as a large amount of carbonic acid is evolved. It has been ascribed, whether correctly or not, we cannot say, to the formation of citric ether, which is very bitter. The disease is caused by the sediment, and often ceases on being drawn off into other casks.

4. *The Acidifying of the Wine* depends upon the conversion of the alcohol into acetic acid, and may be stopped at its commencement by adding alkaline carbonates, which, however, destroy the colour, and affect the taste of the wine.

5. *The Mouldiness of Wine* is a disease in which mould-plants are produced on the surface of the

wine. How or under what conditions the mould is formed, is not known, except that the admission of air is favourable to the disease.

For further information on this subject, we may refer, *inter alia*, to Henderson's *History of Ancient and Modern Wines*, Bence Jones's translation of Mulder's *Chemistry of Wine*, and to the recent works of Shaw and Denman, in English; to those of Julien, Chaptal, Fauré (1844), and Batilliat, in French; and to those of Ritter, Balling, Von Babo, Bronner, &c., in German; also to the chief works on technological chemistry in all languages.

Manufacture.—The mode of manufacturing wine varies in its details in different countries. Pagnierre, in his treatise *On the Wines of Bordeaux*, gives the following description of the manufacture of the superior Clarets. The grapes, after being gathered, are picked; all that are likely to injure the quality of the wine being carefully removed. A principal vat of the best fruit, which is called the mother-cask (*cuve-mère*), is then made, into which, after picking, the workmen continue to put the best grapes, without their stalks, and without treading them, till they are from 15 to 20 inches deep; after which they throw about two gallons of old Cognac or Armagnac upon them, and then another bed of picked grapes, followed by two gallons more of brandy, and so on till the vat is full. Spirit of wine is then added, about four gallons being used for a wine-vat of from 30 to 36 tuns. The amount of brandy and spirits that is added varies with the quality of the vintage, the better vintages requiring the less spirit. When there is a deficiency of saccharine matter in the grapes, starch-sugar is sometimes added. The *cuve-mère*, when filled, is closed and well covered with blankets to prevent the entrance of air, and is left in this state for about a month. A small cock or tap is placed in the side of the vat at about a third of its depth from the bottom, in order to allow of the progress of fermentation being observed; and to enable the manufacturer to know when the wine, having become cool and sufficiently clear, may be racked off and put into casks, previously prepared by scalding and rinsing with a little spirit. While the *cuve-mère* is at work, the ordinary vintage goes on as follows: The grapes are trodden or acted on by machinery in the press, and put with their stalks into the vats, when the fermentation takes place naturally. About a foot of the upper part of the vat is not filled, in order to leave space for the fermentation, which in very mature vintages sometimes occasions an overflow of these limits. The term *chapeau* is applied to the floating mass of stalks, seeds, and skins on the surface. The vats are lightly covered, and in from a week to a fortnight the wine is ready for being drawn off; for if it is left upon the lees (*marre*), or in contact with its crust (*chapeau*), it would take the disagreeable taste of the stalks. The barrels in which it is then placed are filled to about two-thirds or three-fourths, after which the *cuve-mère* is emptied, and its wine is poured in equal portions into these casks so as to fill them; and the remainder is used to replace every week what is lost by evaporation, or may have leaked away. All proprietors have not the means of making a *cuve-mère*; but in its absence, and with the employment of small vessels, wine of an inferior character is produced. The casks being full, are left unbunged for about a week, the bung-hole being in the meantime covered with a brick or piece of wood. They are filled up every two days, and after bunging, at least once a week, till the wine is in a state to allow the cask to rest with the bung-hole at the side, which is not till after a year and a half.

White wines are made in a somewhat different

manner. The grapes are not, as in making red wine, put into the vat to ferment, but after the removal of the stalks, they are trodden, and when taken from the press, the juice, skins, and seeds are put into casks, in which the fermentation takes place, and wine is formed. When the fermentation has ceased, the wine is racked off from the barrels into smaller casks; and any loss that subsequently occurs from evaporation must be replaced once or twice a week.

The nature of the wine-press possesses many modifications. The wine-presses of the Jews consisted of two receptacles, or vats, placed at different elevations, in the upper one of which the grapes were trodden, while the lower one received the expressed juice or must (see Joel iii. 13). These vats were usually hewn out of the solid rock (Isa. v. 2 (margin), and Matt. xxi. 33). In Wilkinson's *Ancient Egyptians*, vol. i. p. 46, there is a figure of a wine-press thus composed of two vats or receptacles. The process of treading, which seems to have prevailed from the earliest ages, is shewn in our copy of that figure, the treaders being assisted

Ancient Egyptian Wine-press.

by ropes fixed to the roof of the press. A certain amount of juice was allowed to exude from the ripe fruit by its own pressure before the treading began. This was kept separate from the rest of the juice, and formed the *gleucos*, or 'sweet wine' noticed in Acts ii. 13. The first drops that reached the lower vat were called the *dema*, or tear, and formed the first-fruits of the vintage, which were to be presented to Jehovah (Ex. xxii. 29). Although the ancient system of treading the grapes still prevails in many countries, it is being gradually displaced by various mechanical appliances. In some parts of France, two wooden cylinders turning in opposite directions are employed to crush the fruit; and the reader will find accounts of more complicated presses in the various works on wine by Cyrus Redding and later authors.

Commerce.—The manufacture of wine has been carried on in all countries where the grape could be successfully cultivated, from the very earliest periods of history; and during the present century, it has followed the footsteps of man, and become established in the American and Australian continents, and promises to become, especially in the latter, a most important introduction. The vine, like most cultivated plants, is capable of producing very numerous varieties, and these, of course, give rise to different qualities of wine; but far more influence is exerted upon the quality of the wine by climate, soil, and the position of the vineyard

as to the sun's influence; so that we not only have wines peculiar to particular countries, but of those, again, we have usually very numerous varieties, produced by special causes within those countries; and in addition to all these, again, we have other differences, produced by the degrees of skill in the manufacture. The earliest wines of which we have any account were made in Asia, but of these we know very little. Later on, we find abundant evidence of the high esteem in which wine was held by the Greeks, Romans, and other civilised contemporary nations; and the name of one of the choicest Roman wines has continued in use to the present time, viz., the Falernian. From what we learn from Pliny and other writers regarding the extraneous additions made by the Romans to their grape juice, and the treatment of the interior of their casks, we should much doubt whether even Falernian would be appreciated by the English palate. The following extract from the article 'Vinum' in Smith's *Classical Dictionary* will give a notion of the way in which the ancients 'cooked' their wines: 'The principal substances employed as *conditurae* or seasonings were—(1) sea-water; (2) turpentine, either pure or in the form of pitch (*pix*), tar (*pix liquida*), or resin (*resina*); (3) lime, in the form of gypsum, burnt marble, or calcined shells; (4) inspissated must; (5) aromatic herbs, spices, and gums; and these were used singly or cooked up into a great variety of complicated confections. It was customary to line the interior of both the *dolia* or casks, and the *amphorae* or pitchers, with a coating of pitch; but besides this, it was customary to add this substance, or resin, in powder, to the must during the fermentation, from a conviction that it not only rendered the wine more full-bodied, but also communicated an agreeable bouquet, together with a certain degree of raciness or piquancy (Pliny, *N. H.* xiv. 25; Plutarch, *Symp.* v. 3). The modern Greeks, it is said, use turpentine or resin in the preparation of their wine, as their ancestors did two thousand years ago. Most Sicilian wines (the ancestors of the Sicilians were Greeks) have a decided resinous taste, as have also the Cape wines. The mediæval history of wine is involved in much obscurity; but we find such abundant mention of Sack and Canary, that although we are not quite clear as to the exact history of those wines, we are not left in doubt as to the high appreciation felt for them by the priesthood and nobility of those times. The Greek islands seem to have furnished a large portion of the wine then consumed in Europe; and the Malmsey of those times was not the produce of Madeira, but of the islands of Tenedos, Lesbos, Chio, and Candia. At a later period the Burgundy Wines (q. v.) of France and the Rhine-wines (q. v.) of Germany became famous, and may be regarded as the commencement of that vast commerce which has now spread all over those countries, and has led to such variety and perfection in the manufacture of this valuable drink. It is beyond the limits of this article to give even a full list of all the known varieties of wine, much less to specify their peculiar qualities. The chief wines of France and Germany are noticed under the heads of Bordeaux (known in England as Claret), Burgundy, Champagne, and Rhine-wines (see also *НОСН-НИМ* and *МОСКИЛ*). There are very choice sparkling wines made in Germany of both the Rhine (or Hock) and Moselle classes; the Moselle wines have latterly been artificially flavoured either with musk or with elder-flowers, to imitate the flavour of the Muscat grape. At first, it was carefully and judiciously done, but is now often carried to excess.—Hungarian and Austrian wines have lately come into notice in Britain, and the former have found

much favour with some consumers. But although Hungary produces the Tokay (q. v.), which, if genuine and old, is scarcely rivalled in the world, yet the wines commonly used are inferior in many respects to the ordinary wines of France and Germany, which they most resemble. The best known are Carlowitz, St George, and Odenburg—white; and Erlauer, Ofner, Menes, Buda, and Grosswardein—red wines. The best Austrian wines are those of Steinberg, Vöslau, and Goldeck—red and white of each; also an effervescing wine somewhat like Sparkling Burgundy, called Sparkling Vöslauer.

The wines of Spain and Portugal are in the highest esteem in Great Britain—those of the former country best known under the general name of Sherry (from Xeres), and those of the latter as Port (q. v.). The Spanish and Portuguese wines, like those of other countries, differ widely in quality. The highest class of sherries are those which are technically called *dry*, that is, are free from sweetness. The Montilla, Manzanilla, Amontillado, and Vino de Pasto, are of this kind. Some red wines are also made in Spain, as the Tent or Rota Tinto, Paxarété, Val de Penas, Benicarlo, &c. The produce of Spain is enormous, being estimated at nearly 136 millions of gallons.

About the middle of the last century, Port, or the wine of Portugal, became the most important wine for British use, and for the highest qualities, very high prices have always been given; indeed, such is the demand for very old wines of the best vintages, that as much as £35 per dozen bottles, or £17, 10s. per gallon, was realised at a sale for Port wine of the year 1820, only a year or two since. This is probably the highest price ever reached for Port; but on the continent, the finest Tokay has realised even more than £36 per dozen at Craoow. Besides Port, we receive from Portugal Bucellas and Lisbon, white wines; and Colares and Calcuvella, red.

The Italian wines are very numerous. The best *reds* are Lambrusco, Barbera, Barolo, Brachetto, Grignolino, Aleatico, Brolio, &c.; the best *whites*, Malvasia, Vino Santo, Lachrymæ Christi, Vernaccia, &c. Of *sparkling* wines, the Red and White Asti, Passeretta, Nebiola, and one or two others, are very good. They differ much from the sparkling wines of other countries in being much less effervescing.

The chief Greek wines are those of Candia and Cyprus, but not much of either comes to Great Britain.

Madeira was long famous for its fine white wine, but the almost total destruction of the vines by the fungous growth known as the oidium, and causing the grape-disease, temporarily stopped the trade. It is, however, beginning to revive.

From the Cape of Good Hope, very large quantities of inferior wine are sent to Europe, and sold as Sherry. The Red and White Constantia of that colony are, however, excellent sweet wines, of a very luscious character.

The United States of America have begun to grow the vine extensively, and to produce wine. At present, it has all been used for home consumption. The most celebrated is the Catawba, and a very good imitation of Champagne.

The Australian colonies have also commenced wine-making, and have produced very fair qualities; the best is a Hock-like wine, called Cwarra.

Owing to the very fine produce of two small vineyards on the banks of the river Yalta in the Crimea, belonging to Prince Woronzov, the Russian government established a School of Wines in the Crimea, but with very indifferent results, as the efforts of this establishment have been to imitate the wines of other countries, instead of producing distinctive ones of their own locality. The wines of the Prince

Woronsov are great favourites where known: the finest is called *Al Danil*; the second, *Massandra*; and the third, *Muscata*. They are light white wines, of a most agreeable flavour, and fine golden-yellow colour.

The following, taken from the annual government returns, will shew the vast commerce carried on in this article of trade. Wine imported into Great Britain from 1st April 1865 to 31st March 1866—Red, 6,803,529 gallons; value, £1,660,214. White, 7,466,221 gallons; value, £2,253,982.

Dietetic and Medical Value of Wines.—It may be laid down as a general rule, that the use of wine, even in moderate quantity, is not necessary for young or adult persons enjoying good ordinary health, breathing fresh country air, and not exposed to overwork or any other abnormal depressing agency. As, however, life advances, and the circulation becomes languid, wine in moderation becomes an essential, or, at all events, a valuable article of food; and even in earlier life, the physician meets large numbers of townspeople, especially women engaged in sedentary occupations, who cannot digest the national drink, beer, which is admirably suited to our outdoor labouring population, and to persons of higher rank who indulges freely in open-air exercises. In such cases, the beer is replaced by the more grateful beverage, tea, which, however, when taken too freely, and without sufficient solid food, gives rise to a form of distressing dyspepsia, which too often impels the sufferer to seek refuge in spirits. In many such cases, cheap wine, which may be purchased under our new tariff at from 1s. 6d. to 2s. a bottle, mixed with an equal bulk of water, will be found an excellent substitute for the beer or tea. We shall first notice the medical uses of those numerous cheap French, German, and Italian wines which have been, during the last few years, so prominently brought before the attention of the British public by certain enterprising wine-merchants; and then briefly notice the uses of the more expensive wines, such as Port, Sherry, Champagne, &c. In the first department of the subject, we shall take Dr *Druitt's Report on Cheap Wines* as our chief authority, and we shall regard as cheap wines those whose price does not exceed 2s. 6d. a bottle. In prescribing wine, whether cheap or dear, the physician desires to give not merely alcohol, for that might be given far more cheaply under the form of gin or British brandy, but a compound liquid containing not only more salts or mineral ingredients than many a mineral water, but also the extractive parts of grape-juice, and the powerful oils and ethers which give to wine its special flavour or bouquet, and its singular exhilarating properties. 'The distinctive elements of wine,' says Dr *Druitt*, 'are to be had in abundance in cheap Bordeaux, Burgundy, and other French wines; in Rhine wine; in the Hungarian, Austrian, and some Greek wine; and in all with a natural and not injurious quantity of spirit. In prescribing *pure wine*—i. e., light natural, virgin wine—the practitioner has a perfectly new article of both diet and medicine in his hands.—*Op. cit.*, p. 22. In cases of debility and indigestion, such wine as that which we are now considering, diluted with cold water, may often be freely prescribed with great advantage in place of tea at breakfast, as well as at luncheon or dinner, or dinner and supper, according as the patient arranges his meals. The best of the cheap wines are those of Bordeaux: they are pure, light, and exhilarating; moderately strong, seldom containing 20 per cent. of alcohol; free from sugar and other materials likely to induce gout or headache; and are admirably adapted, according to Dr *Druitt* (who has experimented largely upon them), for children with capricious and bad appetites, for

literary persons, and for all whose occupations are chiefly carried on indoors, and which tax the brain more than the muscle. They should be taken *at*, not *after*, meals; and in many cases, when judiciously prescribed, they will be of more service to patients suffering from anæmia, chlorosis, dyspepsia, or gouty or rheumatic tendencies, than any form of medicine. The Bordeaux wines are, moreover, of great use in relieving the restlessness, nightly wandering, and thirst that accompany scarlet fever and measles in children; one part of wine with one or two of cold water, according to age, being an excellent drink, acting at once as a diaphoretic, saline, and sedative. The Burgundy wines are fuller, stouter (on an average, from 2 to 4 per cent. stronger in alcohol), and higher flavoured than the Bordeaux of equal price. The cheap Burgundies are inferior to the Bordeaux as medicinal agents; but the higher-priced wines (at and above 4s. a bottle) are of extreme service in cases of debility with nervous exhaustion, and, as Dr *Druitt* remarks, 'what Bordeaux is to the blood, that is Burgundy to the nerves.' Some of the Hungarian wines which are being now introduced into this country, are excellent substitutes for Bordeaux; and not having the acidity, austerity, and coldness of the latter, are often preferred by patients. Amongst the most important of the *dearer* kinds of wine are Port, Sherry, and Champagne. Good old Port is a tonic of great value in cases of fever and other forms of extreme debility; but many persons past 40 dare not take it if they have any predisposition to gout. Port wine given with warm water, administered with a biscuit at bedtime, often induces a good night's rest during convalescence from fever or other weakening diseases. But during the last 15 or 20 years, its price has risen from 30 to 100 per cent.; and the Port purchased at a vintner's by a poor invalid at 4s. a bottle is usually nothing but doctored British spirit that has been sent to Hamburg to be transmuted into wine. In place of good Port, now unobtainable by the poor, the physician had better prescribe good British brandy, if a strong stimulant be required; or such wines as the Hungarian *Ofner* or French *Madeira*, if it is the nutritive value of wine that is required. Sherry is, in a dietetic point of view, the wine in most general use in this country, and if pure, it agrees well with most constitutions. It is the only wine admitted into the *Pharmacopœia*, in which it is employed in the composition of aloetic, antimonial, colchicum, and other medicated wines. It is a wine that suits the stomach in many cases of dyspepsia, but is not often prescribed medicinally. Champagne is a wine that acts as a most valuable medicine in cases of vomiting, irritable stomach, &c., and when the appetite flags, and there is great general debility. Genuine Tokay is so rare a wine that it is almost unnecessary to notice it; it is, however, when procurable, extremely valuable as a cordial for aged persons of broken-down constitution.

WINIFREDE, St., a virgin saint of the ancient British church, formerly held in great veneration in Wales. Her history is obscure and uncertain; but her name is noticeable in connection with the well-known well, to the traditionary miraculous virtues of which, Holywell in Wales owes its origin as well as its celebrity.

WINNEBAGO, a lake, the largest in Wisconsin, U. S., lying 40 miles west of the middle of the west shore of Lake Michigan, and connected by Fox River with Green Bay. It is 28 miles long by 10 wide, containing 212 sq. m., and is navigated by several steamers. The east shore is for 15 miles a wall of rock, hundreds of feet deep below the surface.

WINNEBAGOES, a tribe of Indians who lived around Lake Winnebago in 1639, and were engaged in the war of Pontiac against the English in 1762; in 1794, they were severely defeated by General Wayne, and were engaged in the Black Hawk war of 1831. In 1848, 2631, under a treaty with the government, emigrated to Minnesota.

WINNIPEG, LAKE, the largest of the lakes belonging wholly to British North America, lies 90 miles north of the state of Minnesota, and about 350 miles north-west of Lake Superior, in lat. 50°—54° N., 96°—100° W. It is 264 miles long, 35 miles broad, has an area of 9000 sq. m.; and lies 628 feet above sea-level. Its principal affluent is the Saskatchewan (q. v.), and its surplus waters are carried off by the Winnipeg River, which, flowing south-east, passes through the Lake of the Woods and Rainy Lake, and enters Lake Superior. It is connected by a series of streams and small lakes with Hudson's Bay. A little to the west, and running almost parallel with Lake W., are Lakes Winnipegos and Manitoba, which by small streams are connected with the former.

WINNIPISCIO'GEE, or **WINNIPESAU'KEE** (the latter being the usual pronunciation), a beautiful lake of New Hampshire, U. S., 25 miles long, by some 10 miles wide, but extremely irregular, with deep bays, bold promontories, and numerous islands from a few yards to many acres, with water clear as crystal, stored with fish, and surrounded with hills and mountain peaks. It is navigated by a steamboat, and is a favourite resort of tourists to the White Mountains.

WINSEY, or **WINCEY**, a cloth of Scotch manufacture, consisting chiefly of wool mixed with a portion of cotton.

WINTER GREEN, the popular name of plants of the genera *Pyrola* and *Chimaphila*, of the natural order *Pyrolaceae*, which, according to some botanists, is a sub-order of *Ericaceae*, distinguished chiefly by difference of habit, but also by declinate styles, seeds with a loose winged skin, and a minute embryo in the base of fleshy albumen. Only about twenty species of *Pyrolaceae* are known. They are natives of woods throughout the whole of the northern hemisphere, and are herbaceous or half-shrubby plants, with a corolla of four or five segments, which are almost petals, but are slightly united at the base. Several species of *Pyrola* are natives of Britain, perennial herbaceous plants, with flowers of some beauty. Two species of *Chimaphila*, half-shrubby plants, with beautiful evergreen leaves, natives of North America, *C. umbellata* and *C. maculata*, are valued for their tonic, diuretic, and narcotic qualities, and are used in dropsy, calculus, strangury, and other diseases.

WINTERGREEN, OIL OF, or *Gaultheric Acid*, is an essential oil yielded by the flowers of the *Gaultheria procumbens* (see GAULTHERIA), abundant in New Jersey, and consisting chiefly of salicylate of methyl ($C_2H_5O, C_{14}H_9O_2$), mixed with a small quantity of a hydrocarbon, termed *Gaultherilene*, which is isomeric with oil of turpentine, and which, being more volatile than the salicylate of methyl, is easily separated from it. The latter is so much the more abundant constituent of the oil, that the two may be practically regarded as identical. This oil is not only yielded by the distillation of other plants, as the leaves and flowers of *Monotropa hypopitys*, and the bark of *Betula lenta*, but may be artificially formed by distilling a mixture of 2 parts of crystallised salicylic acid, 2 of anhydrous wood-spirit, and 1 part of oil of vitriol. In whatever mode it is obtained, it presents the appearance of a colourless or yellow oil, of a

powerful, agreeable, and persistent odour; and hence it is largely used in perfumery.

WINTER MOTH (*Cheimatobia brumata*), a species of moth, the caterpillar of which is very injurious to plum trees. It has long been well known as common in many parts of the continent of Europe, and has of late begun to be very abundant also in some parts of England, as in the Vale of Evesham, in Worcestershire, celebrated for its

Winter Moth, wingless Female, and Caterpillar.

plum plantations, where damage has been done by it to the extent of £20,000 or £30,000 in a year. It is an insect about half an inch long, of a light-brown colour. The male alone has wings; the female, as in a few other moths, is wingless. The eggs are hatched early in spring, and the caterpillars, at first very minute, feed upon the buds of the plum. The eggs are deposited on trees, chiefly around the base of the buds, and in chinks of the bark. Like most of the moths, this insect is nocturnal in its habits. It is during night that the males fly about the trees, and the wingless females creep up their stems. The best mode of preventing its ravages is to surround the stems of the trees with something over which the females cannot climb from the ground, in which they pass their chrysalis stage. Boxes are used for this purpose in Germany, in which the ascending insects are trapped. A more easy method is to coat the trees with a composition of tar and grease in the beginning of winter, the time at which these moths appear in their perfect state, and when, of course, the laying of eggs takes place. By visiting the plantation of plum trees with a lantern at this season, the gardener is often also successful in killing great numbers of them.

WINTER'S BARK, a stimulant, aromatic, and

Winter's Bark (*Wintera aromatica*).

tonic bark, resembling cinnamon, and used for the same purposes. It derives its name from Captain

Winter, who first brought it from the Strait of Magellan in 1579. It is the produce of *Drimys Winteri*, a native of some of the mountainous parts of South America, and abundant in the lower grounds of Cape Horn and Staten Island—an evergreen shrub with laurel-like leaves, corymbs of white flowers, and many-seeded berries. This shrub belongs to the natural order *Magnoliaceae*, and to a section of it which has by some been constituted into a separate order, *Winteraceae*, chiefly distinguished by dotted leaves and aromatic qualities. The Star Anise (*Illicium*) is nearly allied to it. The bark of other species of *Drimys* has similar properties to Winter's Bark, as that of *D. Granatensis*, much used in Brazil as a remedy for colic, and of *D. azillaris*, a New Zealand tree.

WINTERTHUR, one of the most industrious and beautiful of the smaller towns of Switzerland, in the canton of Zurich, stands on the Eulach, 14 miles north-east of Zurich. Its situation among hills, many of which are clothed with vines, is specially pleasant. Cotton-spinning, cotton-printing, dyeing, and the manufacture of machinery and weapons, are actively carried on. Pop. about 6000.

WINTHROP FAMILY.—JOHN, governor of the colony of Massachusetts, was born in Groton, county of Suffolk, England, January 12, 1588, was bred to the law, appointed Justice of Peace at the age of 18, and on account of his excellent and pious character, was, in 1629, elected by the governor and company of Massachusetts Bay to govern their colony. He sold his estate, and, April 7, 1630, sailed from Yarmouth with 900 persons. During the voyage, he composed an essay, entitled *A Model of Christian Charity*. He was re-elected governor every year until 1634, when he became deputy-governor under Sir Harry Vane, with whom he had an animated controversy on the doctrines of Mrs Hutchinson. In 1637, he was elected over Sir Harry, and continued governor, with a brief interval, during his life, and had more influence probably than any other man in forming the political institutions of the northern states of America. He was opposed to an unlimited democracy, for he said: 'The best part of a community is always the least, and of that best part the wiser part is always the lesser.' He kept a journal up to 1649, two books of which were published in 1790; and the third, found in the New England Library, kept in the tower of the Old South Church in Boston, in 1816. A revised edition was published at Boston, in 2 vols. (1825—1826). He died at Boston, March 26, 1649.—JOHN, governor of Connecticut, son of the preceding, was born at Groton, England, February 12, 1606; educated at Trinity College, Dublin; made the tour of Europe; went to America in 1631, was chosen a magistrate in Massachusetts, but returned to England; and in 1635 went to Connecticut, built a fort at the mouth of the Connecticut River, was made governor of the colony, and founded the city of New London in 1661. He obtained a charter for the colony from Charles II., and was first appointed governor under it; and, in 1676, represented his colony in the congress of the united colonies at Boston. He was a man of eminent virtues, and considerable acquirements. Some of his papers are contained in the *Philosophical Transactions*. He died at Boston, April 5, 1676.—JOHN, LL.D., American scholar, a descendant of the first Governor W., was born in Massachusetts, 1715; graduated at Harvard College, 1732; and in 1738 was appointed Hollis Professor of Mathematics and Natural Philosophy. In 1740, he observed the transit of Mercury; and, in 1761,

went to Newfoundland to observe the transit of Venus. He published tracts on Earthquakes, Comets, and other astronomical subjects. Died at Cambridge, May 3, 1779.—ROBERT CHARLES, LL.D., American statesman and orator, descendant of the sixth generation from the first Governor W., was born at Boston, May 12, 1809, graduated at Harvard College in 1828, studied law with Daniel Webster, and was admitted to the bar in 1831, but soon abandoned law for politics, and was elected to the state legislature in 1834, where he served five years, three as Speaker of the House. In 1840, he was elected to Congress, of which he was a member for ten years. In 1847, he visited Europe, and was the Whig candidate for Speaker, but defeated after a balloting of three weeks. In 1850, he succeeded Mr Webster, who became Secretary of State, as senator from Massachusetts, a place in which he was succeeded by the more radical Charles Sumner. He was also defeated as a candidate for governor of Massachusetts. His *Addresses and Speeches* were published in 1852, and he has since then spent some years in Europe.

WIRE AND WIRE-DRAWING. The facility with which any metal can be drawn into wire depends upon its ductility. Most metals have this property; but some, like bismuth and antimony, are so brittle that they can only be drawn out with difficulty, and wire made from such metals is useless, from want of tenacity. See DUCTILITY.

Metals largely used for making wire, such as iron, brass, and copper, are drawn by essentially the same process. We may take iron as an example. It is prepared by cutting up flat rolled plates into square rods of a given thickness. This is done by means of a pair of slitting rollers; one of these has

Wire-drawer's Bench.

grooves, equal to the breadth of the rods wanted, fitting into corresponding grooves in the other, which cut up the metal like scissors. The rods are cleaned of scales of oxide, either by mechanical rubbing, or by chemical treatment with dilute sulphuric acid. If the rod is thick, it has its square edge taken off by rollers. It is then drawn into wire by forcing it through the hole of a *draw-plate*. This is an oblong piece of hard steel pierced with conical holes, gradually diminishing in diameter, and having the smallest ends of these tapering holes carefully prepared to the required size. Sometimes cubical-shaped dies, each with a single trumpet-shaped hole, are used. A wire-drawer's bench is shewn in the annexed figure, in which A is the drawing-plate, and B the drawing-block or cylinder. The motion is given by means of bevelled wheels connected with a shaft driven by steam or water power.

The workman commences by making a point on the rod, so as to allow it to pass through the hole, and be grasped by a pair of pincers attached to a chain, which draws it out till the length is sufficient

to pass round the cylinder. This much is done by hand, and then the cylinder, being put in gear, is made to revolve and pull the wire through the draw-plate—coiling it round itself as the drawing proceeds. After being once drawn, it is again passed through a smaller hole, and so the process is repeated till it has been reduced to the size required. Fine wire may require from 20 to 30 drawings. The cylinder revolves slowly with a thick wire, and the speed is increased as the size diminishes. After being passed a few times through the draw-plate the metal becomes brittle, and requires to be annealed. Sometimes, a lubricating substance—as wax, grease, or soap—is employed during the drawing, especially for fine wires.

For some very accurate purposes, such as chronometer springs, and for gold and silver lace, the wire is drawn through jewelled holes, that is, holes perforated in rubies and other hard gems. A silver wire 170 miles long, and about $\frac{1}{1000}$ of an inch in diameter, has been drawn through a hole in a ruby, and found, by a micrometer, to be of exactly the same size at the end as at the beginning; whereas the drawing of a length of 16 miles of brass wire through a steel draw-plate necessitates a readjustment of the hole.

Platinum wire can be drawn as thin as $\frac{1}{1000}$ of an inch in diameter by first encasing it in silver, drawing down the compound wire, and then dissolving off the silver with nitric acid. By the same process, gold wire can be obtained only $\frac{1}{1000}$ of an inch in diameter. It has been shewn by Babbage, as an illustration of how greatly labour increases the value of a raw material, that one pound of iron, which costs twopence, will yield 50,000 wire pendulum springs for watches, each weighing about one-seventh of a grain, and selling at the retail price of twopence.

Wire, although mostly cylindrical in form, is drawn of many different sections, such as oval, half-round, flat, triangular, moulded, and the grooved pinion-wire from which the small toothed pinions for clocks and watches are cut. Copper wire of different forms is used to form patterns in the blocks used by calico-printers.

The following table (given by Dr Tomlinson) of weights, omitting fractions of a pound, which were sustained by wires 0.787 of a line in diameter, shews the comparative tenacity of a few of the metals: Iron, 549 lbs.; copper, 302 lbs.; platinum, 274 lbs.; silver, 187 lbs.; gold, 151 lbs.; zinc, 110 lbs.; tin, 35 lbs.; lead, 25 lbs. It may be remarked here that some kinds of brass wire have been noticed to become extremely brittle in the course of time, especially if subjected to vibration, and even to break when used to support objects, without any assignable cause.

The quantity of wire used in the English manufacturing districts must be enormous, steel and iron wire being required for the manufacture of needles, fish-hooks, hooks and eyes, carding-machines, screw-nails, fencing, and basket-work; brass wire for the manufacture of pins, wire-cloth for paper-making and other machines, and chain-making; and copper wire for bell-hanging. Nothing, however, has increased the production of wire, both iron and copper, more than the electric telegraph. Belgium, which a few years ago exported none, now exports 1200 tons annually of iron wire.

WIRE-ROPES have come greatly into use of late years for winding purposes in mines and on inclines, for the rigging of ships, and for numerous engineering contrivances; also for the construction of electric-telegraph cables. They are almost always galvanised, that is, coated with zinc. A hemp rope 6 inches in circumference, and weighing

9 lbs. per fathom; an iron-wire rope $2\frac{1}{2}$ inches in circumference, and weighing 5 lbs. per fathom; and a steel-wire rope $1\frac{1}{4}$ inch diameter, and weighing 3 lbs. per fathom, are all of equal strength—the breaking strain of each being 10 tons.

WIRE-WORM, a name given by farmers and gardeners to the larvæ of Click Beetles (q. v.), which are long and hard, and often swarm in corn-fields, gardens, and pastures, feeding on the roots of crops, and doing great mischief. The best known British species are *Elatér* or *Agriotes lineatus*, *E.* or *A. obscurus*, and *E.* or *A. sputator*. The first of these, which is the largest, is in its perfect state about half an inch long, with brown head and thorax, clothed with cinereous down; the elytra tawny, striped with brown. The larva, when full grown,

Wire-worm :

a, perfect insect, magnified; b, natural size of perfect insect; c, wire-worm magnified; d, natural size of wire-worm.

is fully half an inch long, very narrow, yellowish, hard, and shining, the jaws tipped with black. The second species named is in its perfect state of an earthy-brown colour. The third has a black head and thorax, with many dots, the elytra light brown with dotted lines. It is only about a quarter of an inch in length. Wire-worms are very small when first hatched, and are said to live for years in the larva state. Moles, rooks, and pheasants are useful in destroying them. Clover crops are said to have the effect of increasing their numbers. Farmers and gardeners resort to various means in order to get rid of this pest, as hard rolling after a top-dressing of lime, and mixing spirits of tar, gas-lime, or rape-cake with the soil; but one of the most effectual is the strewing of slices of potatoes or turnips on the ground, under which they soon congregate, and great numbers are thus easily destroyed. The name W. is often very vaguely used, so as to include not only the larvæ of some moths, but even Myriapods of the genus *Julus* (q. v.), which somewhat resemble the true wire-worms in form, although in reality very different, and probably not injurious to crops, as they are.

WISBECH, or WISBEACH, a market-town in Cambridgeshire, in the Isle of Ely, occupies a position of importance in the Fen District, on the Nen, 18 miles east-north-east of Peterborough. W. is connected by a branch of the Great Eastern Railway with Peterborough; and two railways are at present in course of construction, which, when completed, will connect it with the Great Northern branch to King's Lynn, and directly with the Great Northern main line. By the Nen, which falls into the Wash, at the distance of 12 miles below W., communication is maintained between this town and the North Sea. The navigation of the river has been much improved within recent years, and W. is considered the port of Cambridgeshire. It is generally well built, contains a number of useful institutions, and carries on rope-spinning,

brewing, and general trade. Corn, timber, wool, salt, and seeds are exported; wine, deals, oil-cake, corn, slates, and coal imported. In 1866, 722 vessels, of 77,749 tons, entered and cleared the port. Pop. (1861) 9276.

WISBY, a once famous seaport of the Swedish island of Gothland (q. v.), capital of the island, and situated on its west coast, about 130 miles south of Stockholm. It is of the highest historical and antiquarian interest; and though the time of its foundation is unknown, it was, during the 10th and 11th centuries (200 years before the establishment of the Hanseatic League in 1241), one of the most important commercial cities in Europe. It was a principal factory of the Hanseatic League during the 14th and 15th centuries. The eastern trade, which during the 11th and 12th centuries passed through Russia, and thence down the Baltic to Gothland, centred in W., and greatly enriched that port. In 1361, Valdemar III. of Denmark took the town by storm, and, plundering it, obtained an immense booty. This was a fatal blow to the prosperity of the place. The architecture of W. is exceedingly interesting. Its ancient feudal walls and towers exist in almost an entire state as they were in the 13th c., and render its appearance, as seen from the sea, exceedingly striking. The early grandeur of the town is attested by the fact, that the town contains well-preserved remains of 18 churches, all of which date from the 11th and 12th centuries, are varied in form and ornament, and are a mine of interest to the student of Early Gothic. The oldest is the church of the Holy Ghost, built in 1046. St Mary's, built in 1190, is the only church now kept up for the use of the inhabitants. Pop. (1865) 6043.

WISCHEHRAD (Old Slav. and Bohem. *wyschegrad*, Pol. *wyszogrod*) is the name of numerous towns and castles in all Slavonic countries; e. g., the original residence of the princes of Bohemia, now a quarter of the city of Prague. The word is composed of the root *wys* or *wyech*, high, and *hrad* (Rus. *gorod*, Pol. *grodz*, in some dialects *grätz*), a fort, castle, town. *Hrad* is from the same root as Ang-Sax. *hrecod*, Eng. *reed*, *rod*, another form being *yerde* or *yard*. It signified primarily a place defended by rods or poles, a palisaded fort, and hence a town. See **TOWNS**.

WISCONSIN, one of the United States of America, between lat. 42° 30'—46° 50' N., and long. 87°—92° 50' W.; 285 miles from north to south, and 265 from east to west; containing 56,000 sq. m., or 35,840,000 acres; is bounded N. by Lake Superior and the state of Michigan, E. by Lake Michigan, S. by Illinois, and W. by Iowa and Minnesota, from which it is separated by the Mississippi and St Croix rivers. It is divided into 58 counties. Its chief towns are Milwaukee, Racine, Kenosha, Janesville, Watertown, Waukegan, Madison (the capital), &c. Its chief rivers are the Mississippi and its branches, Rock, Wisconsin, Black, Chippewa, and St Croix, which drain four-fifths of its surface; the Menomonee on the north-eastern border; Wolf and Fox, emptying into Green Bay; and numerous small rivers emptying into Lakes Michigan and Superior. Besides these great lakes and Lake Winnebago, the whole state is studded with small, clear, and beautiful lakes, well stocked with fish. The country is a high rolling prairie, from 600 to 1200 feet above the sea, with no considerable mountains, but numerous hills or mounds. In the rainy season, the rivers Fox and Wisconsin, emptying into the Mississippi and Lake Michigan, flow into each other. The geological formations extend only from the Primitive to the

Devonian. On Lake Superior are primitive rocks, granite, magnetic iron, quartz, slates, sandstone, drift, and beds of red clay and marl; sandstone cliffs on the Mississippi; the middle and southern parts of the state have the Lower Magnesian Limestone, a belt of white sandstone with beds of shells, then the lead-bearing group of Upper Magnesian Limestone. Besides the great magnetic iron bed on Lake Superior, and the rich lead region bordering on Illinois, copper is found in several places; zinc, some silver, plumbago, bitumen, peat, fine marble (some of light pink with red veins, and blue and dove colour), gypsum, and coal in small quantities. Of the curiosities are earthworks in the forms of men and animals; ancient fortifications; Devil's Lake, of 600 acres, on the summit of a mound 300 feet high; the precipitous shores of Lake Pepin rising to 500 feet, 200 feet being a perpendicular wall of magnesian limestone; the high bluffs of the Mississippi and Wisconsin rivers; the falls of the St Louis (320 feet in 16 miles) and of the Memomonee (134 feet in 1½ mile). The climate is cold, the winters long and severe; but the state is considered one of the most healthy in the west. The soil in the north is broken, with drift and boulders, covered with heavy pine forests, and not well adapted to cultivation; the middle and southern region, of prairies and park-like oak openings, is exceedingly rich and productive, raising great quantities of wheat, Indian corn, oats, barley, potatoes, tobacco, &c. Besides the great pine-forests of the north, there are spruce, cedar, various oaks, hickory, birch, elm, sycamore, sugar-maple, &c. Of animals there remain the elk, deer, bear, foxes, wolves, beaver, gopher, &c.; and numerous birds and water-fowl, fattening upon the wild rice, on the margins of the numerous lakes. The chief manufactures are of iron, lumber, agricultural implements, flour, spirits, and malt liquors. The chief export is wheat, which amounted, in 1862, to nearly 20,000,000 bushels, some of which was sent from Milwaukee to England without transhipment. There are 13 railways, extending 926 miles, and extensive lake and river navigation. State and government appropriations of land have richly endowed a state university at Madison, normal, high, and common free schools, and the usual state asylums. The constitution and government closely resemble those of the older states. There are 713 churches, of which 241 are Roman Catholic—200,000, out of 287,500 worshippers, belonging to that communion. W. was explored by the French missionaries in the latter part of the 17th c., and Indian trading-posts were also established; but the actual peopling of the state has been recent, and very rapid—a large proportion being of foreign birth—German, Norwegian, Irish, Welsh, &c. It was organised as a territory in 1836, and admitted into the Union as a state in 1848. Pop. in 1840, 30,945; 1850, 305,391; 1860, 775,873.

WISCONSIN, a river of Wisconsin, U. S., rises in the northern centre of the state, and flows southerly upwards of 200 miles to the Winnebago portage, thence south-west 114 miles to the Mississippi River, 4 miles below Prairie du Chien. Navigable 200 miles.

WISE, HENRY ALEXANDER, American statesman, was born at Drummondtown, Accomac county, Virginia, December 3, 1806; graduated at Washington College, Pennsylvania, in 1825; studied law at Winchester; settled and married at Nashville, Tennessee, but two years after returned to his native county, and engaged in politics; in 1825, advocated the nomination of General Jackson at the Baltimore Convention; opposed nullification, but maintained

the state-rights doctrines of Jefferson and Madison as expressed in the Virginia resolutions of 1798, that 'each state for itself is the judge of the infraction of the constitution, and of the mode and manner of redress.' Elected to Congress in 1833, he was involved in a duel with his opponent, whose arm he fractured. On the removal of the government deposits by General Jackson, he went over to the opposition or Whig party, but was sustained by his constituents, over whom he had an unbounded personal influence. In 1837, he was the second of Mr Graves, a member of Congress from Kentucky, who shot Mr Cilley, a member from Maine, in a duel. In 1840, he secured the nomination of John Tyler as Vice-president; and on Tyler becoming President by the death of General Harrison, had a powerful influence in his administration. Nominated minister to France, he was rejected by the Senate, but confirmed for Brazil, where he resided until 1847. He was now once more identified with the Democratic party; and in 1854, after an arduous electioneering campaign, in which, though in feeble health, he travelled 3000 miles, and made 50 stump speeches against the 'Know-nothing' or Protestant native American party, he was elected governor of Virginia. In 1859, he published a treatise on Territorial Government, maintaining the right of Congress over the institution of slavery. In December of this year, he signed the death-warrant of John Brown, hanged for treason in attempting to excite a negro insurrection. In 1861, as member of the Virginia Convention, he laboured for conciliation; but when his state voted for Secession, he entered heartily into the war, and was appointed Brigadier-general, serving in the Kanawha Valley, and later, defending Roanoke Island, where his son, Captain Wise, was killed.

WISEMAN, NICHOLAS, Cardinal and Roman Catholic Archbishop of Westminster, was born August 2, 1802, at Seville, of an Irish family settled in Spain. He was brought to Ireland in his childhood, and received his first education at Waterford, whence he was removed to the Roman Catholic college of St Outhbert at Ushaw, near Durham. In his 16th year, he entered as an ecclesiastical student the English College at Rome, and after a very brilliant course, received holy orders at Rome in 1823, at which time he was also admitted to the degree of Doctor of Divinity, and was appointed Vice-rector of the English College, and Professor of Oriental Languages in the university of the Sapienza. In 1828, he published his *Horæ Syriacæ*, and in the end of that year was named Rector of the English College. It was while he held this office that he delivered his *Lectures on the Connection of Science and Revealed Religion* (2 vols. 8vo, 1836). But in England he first became known by a series of lectures on *The Doctrines of the Catholic Church*, delivered at Moorfields Church, and published in two vols. in 1836. In the same year he established, in concert with Mr O'Connell, the *Dublin Review*, a journal which has since continued to be the quarterly organ of the Roman Catholic body, and to which Dr W., even while residing abroad, was a regular contributor. In 1840, he was named Coadjutor Vicar-apostolic of the Central District of England, with the title of Bishop of Melipotamus *In Partibus Infidelium* (q. v.). At the same time he was appointed President of St Mary's College of Oscott, where he took up his residence. The circumstances of religious parties in England at this period contributed much to bring Dr W.'s very remarkable abilities as a polemical writer into prominence; and the dissensions which arose in the Church of England during the Tractarian Controversy, were turned to effect by him in various lectures, pamphlets, reviews,

essays, &c. In 1846, he was transferred as Coadjutor Vicar-apostolic to the London district; and in 1849 became himself acting vicar. In the following year, he came still more remarkably into notice, during the progress of a change in the position of the Roman Church in England, which, for a time, was the occasion of almost unexampled religious excitement in the country. From the reign of Elizabeth, the sees in England having been occupied by bishops of the Established Church, and it being penal for a bishop or priest of the Roman Catholic Church to officiate in England, the Catholics, for the necessary religious ministrations of their church, had resorted to the well-known expedient of a system of bishops *In Partibus Infidelium* (q. v.), with the title and authority of Vicars Apostolic (q. v.). This form of church government, with some modification, had in substance subsisted from the time of James I.; but from the date of the passing of the Catholic Emancipation Act, a desire had gradually sprung up among Catholics for the restoration of the normal form of church government by the appointment of regular bishops. This measure was finally determined on by the pope in the year 1850, and a new distribution of the kingdom was made into twelve sees (one of them archiepiscopal), in which, in order that it might not be supposed to clash with the existing episcopal system, the names of the ancient sees were carefully avoided, the titles of the new bishops being taken exclusively from cities and towns which were non-episcopal. Dr W. was named archbishop of the see of Westminster, which included great part of the district already under his charge, and was at the same time created cardinal. This measure, for which the Protestant public were but little prepared, and which was made more formidable in their eyes by the language which was employed, although but following the established canonical forms, and bearing altogether on the spiritual concerns of the Catholics, was supposed to involve an invasion of the rights and dignities of the Established Church and of the crown, and called forth a storm of religious excitement which was unexampled during the memory of the living generation. Whilst this excitement, which was much influenced by a letter addressed by the prime minister to the Bishop of Durham, was at its height, the new cardinal, who had gone to Rome to receive the cardinal's hat, returned to England, and published an explanatory address of great ability and moderation, but yet firmly asserting the strictly constitutional rights of his fellow-Catholics, entitled *An Appeal to the Reason and Good Feeling of the People of England on the Subject of the Catholic Hierarchy*. This address, as well as certain lectures subsequently delivered by him, and extensively circulated, did much to mitigate the excitement, which nevertheless led to violent debates in parliament, and to the passing of an act prohibiting the use of ecclesiastical titles other than those recognised by the law. See ECCLESIASTICAL TITLES ASSUMPTION ACT. Notwithstanding these unfavourable circumstances of his introduction into notice in England, however, the undoubted abilities and great literary eminence of Cardinal W. eventually compelled the admiration of the British public. He took frequent occasion, moreover, by public lectures and addresses on the neutral subjects of education, literature, and art, to identify himself with the spirit of progress, and with the national sentiments of his fellow-countrymen; and notwithstanding the infirmity of his constitution, which began to fail soon after his return to England as cardinal, he published during these years a succession of works which, although with the strong religious bias natural to a Roman Catholic churchman of earnest convictions,

possessed much, nevertheless, congenial to the sympathies of cultivated Englishmen of every degree. The *Lectures on Religion and Science* already referred to; *On the Connection between the Arts of Design and those of Production*; on the *Influence of Words on Thought and Civilisation*; on the *Points of Contact between Science and Art*; *Recollections of the Last Four Popes*, and other similar works, obtained an extensive circulation; and partly from their effect upon the public mind, partly, no doubt, from the reaction consequent on what was soon felt to have been a groundless and exaggerated alarm, Cardinal W. came by degrees to command the respect of the public at large. He died in his 63d year, on the 15th February 1865; and his funeral, which was conducted with great solemnity, and excited great public curiosity and interest, was witnessed with every demonstration of respect by one of the largest assemblies seen for many years in London. Besides admittedly high professional learning, he was a scholar of rare and singularly various attainments, an eminent linguist, a well-informed scientific scholar, a distinguished orator, a graceful and vigorous writer, and an accomplished critic and connoisseur of art. In addition to the works incidentally mentioned above, he published *The Real Presence of the Body and Blood of Our Lord Jesus Christ in the Eucharist* (8vo, 1836); *Reply to Dr Turton on the Eucharist* (8vo, 1839); *Lectures on the Ceremonies of Holy Week* (8vo, 1839); *Essays on Various Subjects* (3 vols. 8vo, 1853)—a selection of articles contributed to the *Dublin Review* and other periodicals, and of other fugitive essays; *Fabiola, or a Church of the Catacombs*; a singularly truthful and life-like picture of early Christian life in classic Rome; *Sermons* (2 vols. 8vo, 1864); with many shorter publications not as yet collected. He also left a large collection of MSS., many of them prepared for the press, a selection from which has already been announced as in the press.

WISHART, GEORGE, one of the early Reformers of Scotland, is supposed to have been a native of Forfarshire, a son of James Wishart of Pittarrow, justice-clerk in the reign of James V. The exact date of his birth is unknown. He first emerges into notice in the beginning of the 16th century. At this time he taught a grammar-school at Montrose, and made himself remarkable by introducing the study of Greek. He began also to preach the doctrines of the Reformation, and was obliged to flee into England. Here he is found at Bristol about 1538, preaching the same doctrines, but being seized upon and threatened with death, he publicly recanted. Later he is found at Cambridge, in the centre of the Anglican Reform movement, which had begun there under the influence of Bilney and Latimer. He is described at this time by a pupil of the name of Tylney as a 'tall man polde-headed, of melancholy complexion, black-haired, long-bearded, comely of personage, well spoken after his country of Scotland, courteous, lowly, lovely, glad to teach, desirous to learn, abstinent in his habits, and very charitable to the poor.' His portrait, which has been preserved in the university of Glasgow, answers to the personal characteristics here mentioned. He returned to Scotland in 1543 or 1544, with the commissioners sent to negotiate a treaty with Henry VIII., and it was then that he entered upon his special reforming mission, terminating in his martyrdom. He appears to have possessed great powers as a preacher, although it is doubtful whether he ever took orders; and he travelled from town to town, and county to county, making everywhere a great impression by his stirring words. Knox has given in his *History*, Book I., a very striking descrip-

tion of the effects of W.'s preaching. Its effect upon himself was the most important and fruitful of all. When the preacher came to Lothian, Knox, charmed by his character and teaching, attached himself to his person, bearing a 'two-handed sword' before him. This precautionary defence was rendered necessary by two attempts supposed to have been instigated by Beaton against his life. His activity and influence were too prominent long to escape notice. Cardinal Beaton had had his eye upon him for some time, and while he rested at Ormiston, after preaching a powerful sermon at Haddington, he was made a prisoner by the Earl of Bothwell. Beaton himself was in the neighbourhood with a considerable force, in case it should have been attempted to rescue him. He was conveyed to St Andrews, and immediately put upon his trial before an ecclesiastical tribunal. Arran, the governor, refused to give his countenance to the proceedings; but the Reforming preacher was nevertheless condemned to be burned at the stake; and the sentence was carried out before the castle or episcopal residence at St Andrews on the 1st of March 1546.

W. is reported to have given utterance at the stake to a prophecy of the death of the cardinal, which took place about three months after his martyrdom. 'But he who from yonder high place beholdeth us with such pride shall, within a few days, be in the same as ignominiously as now he is seen proudly to rest himself,' are the words attributed to him. This has appeared to some recent writers to strengthen the suspicion, otherwise suggested, of W. having been accessory to the plot for assassinating the cardinal. The main ground of this suspicion is the discovery of a document in the State Paper Office, bearing that 'a Scotchman called Wyshart,' a friend of the Laird of Brunstone, was concerned in this plot. Mr Tytler confidently adopted the view that this friend of the Laird of Brunstone and the Reformer were the same person, and it cannot be denied that there are reasons in favour of this inference, not in the mere coincidence of the name, perhaps, but in the fact of the association of the person bearing it with the Laird of Brunstone, who was a familiar friend of W.; and further, in the fact, that Kirkaldy of Grange and the Master of Rothes, who are mentioned in the document as conspiring either to 'apprehend or slay the cardinal,' were afterwards really the perpetrators of his murder. At the same time, it cannot be said that there is decisive evidence to prove that the 'Wyshart' of the state document was George W., the Reformer and the martyr. The coincidences in the case might be accidental, and the question will probably remain among the *questiones rezatae* of Scottish history.

WISMAR, the second seaport of Mecklenburg-Schwerin, at the head of a bay of the same name, an inlet of the Baltic, 54 miles south-west of Rostock by railway, 31 in a straight line. Its harbour, nearly land-locked by the island of Poel, is the best on the Baltic coasts, and is furnished with shipbuilding docks. Its old fortifications have been removed; but many of its old buildings, which are exceedingly curious and picturesque, remain. The Gothic church of St Mary (founded in 1339) is 300 feet long, and 200 feet broad, and has a tower 309 feet high. Commerce, the fisheries, tobacco and sail-cloth manufactures, and agriculture are the principal employments of the inhabitants; there are also breweries and distilleries. W. is the terminus of a branch of the Mecklenburg Railway, and communication by steamers subsists between it and Copenhagen. In 1865, 717 vessels entered and cleared the port. Pop. (1864) 13,133.

WISSEMBOURG, a small fortified frontier town of France, in the dep. of Bas-Rhin, stands on the Lauter, 42 miles north-north-east of Strasbourg by railway. It carries on a flourishing trade, and manufactures tiles, bricks, soap, hats, &c. Besides its fortress, a line of works, called the Lines of Wissembourg, extend south-east to Lauterburg—a distance of nine miles. The cathedral, the only remarkable building, dates from the 13th century. Pop. (1866) 5151.

WISTARIA, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having pinnate leaves and flowers in terminal racemes, the pod leathery. The species were formerly included in the genus *Glycine*. Some of them are amongst the most magnificent ornamental climbers known in British gardens. *W. frutescens*, a native of Virginia, Illinois, and other parts of North America of

Wistaria Chinensis.

similar climate, found chiefly in marshy grounds, attains the length of 30 feet, and has beautiful racemes of fragrant bluish purple flowers. *W. Chinensis* or *consequana*, a native of China, has larger flowers in pendulous racemes, and its branches run to the length even of 90 feet. In Britain, these plants are generally trained on walls.

WITCHCRAFT* is merely the form that the belief in the arts of magic assumed under the action of certain notions introduced by Christianity. The powers supposed to be possessed by the witches,

*Not a little light is thrown on the original conception of witchcraft, and the magic arts in general, by observing the primary meaning of the various terms employed in connection with them. The most striking thing is the number of those terms that come from roots signifying simply to do, perform. From this notion, the transition is easy to a variety of shades of meaning, as is seen in Lat. *facinus*, which radically signifies a deed (from *facere*, to do), but became restricted to a bad deed, a crime. The Greek *ἔργον* or *ἔργον* (= Eng. work), and the Lat. *facere*, *operari*, were used, without any addition, to signify to perform sacrifice or other sacred or magical rite. Accordingly, in Low Lat., *factura* signified sorcery; and in modern Ital. *fattura* = incantation, and *fattuchiera* = a sorceress or witch. Lat. *factum* becomes in Span. *hecho*, and means a crime; while *hechicero* is a sorcerer, and *hechiera*, a witch. The Portuguese *feticão*, magic, is also from Lat. *factum*; and Sans. *kratu*, a sacrifice, is from *kri* (= Lat. *creare*), to make.

The Eng. *witch* is *vicca* in Ang.-Sax., which has also *vician*, to fascinate, and *vicancrift*, the art of magic; the Low Ger. dialects have similar forms (a.g., Dutch *wikterij* = witchcraft); in High Ger. there are no cognate names. These words, as is seen in the Dutch form,

and the rites and incantations by which they acquired those powers, were substantially the same as belonged to the devotees of the Greek Hecate (q. v.), the Striga and Venefica of the ancient Romans, and the Vala or Wise Woman of the Teutonic pagans. But when, along with the knowledge of the one true God, the idea of a purely wicked spirit, the enemy of God and man, was introduced, it was natural that all supernatural powers not proceeding directly from the true God, should be ascribed to him. This gave an entirely new aspect to such arts: they became associated with heresy; those who practised them must be in compact with the devil, and have renounced God and the true faith. Previously, if a witch was punished, it was because she had been guilty of poisoning, or at least was believed to have poisoned or wrought some other actual mischief. Now, however, such power was only the power to work evil; and merely to be a witch was in itself a sin and crime that filled the pious mind with horror. This feeling, zealously fostered, first by the Catholic clergy, and then no less by the Protestant, rose to a frenzy that for four centuries filled Europe with the most shocking bloodshed and cruelty.

Almost all the various notions and practices noticed under the heads MAGIC, DIVINATION, INCANTATION, AUGURIES, CHARM, TALISMAN, ORDEAL, FETTERING, EVIL EYE, &c., are embodied more or less prominently in the huge mass of superstitions which formed the creed of witchcraft in its full development. A reference, therefore, to those heads, and to the kindred subjects of ASTROLOGY and ALCHEMY, saves the necessity of entering into descriptive details of what witchcraft was. What was new and distinctive in the witchcraft of Christendom was the theory of magical arts which it involved. The doctrine of the Devil (q. v.), as finally elaborated in the middle ages, established in the world a rival dominion to that of the Almighty. The Arch-fiend and his legions of subordinate Demons (q. v.) exercised a sway, merely permitted, no doubt, but still vast and indefinite, not only over the elements of nature, but over the minds and bodies of men—all except those who had been admitted by baptism into the number of the 'redeemed' (see ATONEMENT), and continued to be guarded by the faith and rites of the church. The faithful could not be led into evil against their will, nor essentially injured in person; but not even they were altogether exempt from diabolic annoyance, for the immunity does not seem to have extended to

have clearly no connection with *witan* (Ger. *wissen*), to know, which is usually given as the root of the English witch; and the most probable etymology is that proposed by J. Grimm, who derives them from the Gothic *veihan* (O. H. Ger. *wihan*, modern Ger. *weihen*), which signified to consecrate, but which he infers to have meant primarily to do, make, perform (see *Deutsche Myth.*, pp. 36, 58, 408; *Deutsche Grammatik*, iii. 181). *Wicht*, or *wicht*, is evidently a derivative from this root, and signified a thing made (Lat. *factum*), a creature, a person, and, in some Teutonic dialects, a demon. A *vicca* was thus a doer of sacred or magic rites (compare the 'I'll do, I'll do, I'll do!' of Shakspeare's witches). *Wicked* is a participle from the same root, and signified primarily bewitched, accursed, hence perverse. *Wizard* is probably a masculine form of *vicca*.

Nearly corresponding to English witch were the Lat. terms *saga*, a knowing or wise woman; *strix*, *striga*, a kind of nocturnal bird, hence a witch; *venefica*, literally, a poison-maker, a concocter of drugs. The Ger. *hexe*, Old Dutch *hagetisse*, Ang.-Sax. *hægese*, or *hægese* (from which Eng. *hag*), appear to come from *hag*, cognate with Lat. *sagus*. In O. Norse, *hagr* signifies dexterous, cunning.

their belongings. As a strictly logical consequence of this assumed constitution of things, it followed, that those mortals who had the gifts of producing supernatural effects of any kind (and that such gifts had been possessed by individuals in all ages and countries, was not for a moment questioned), must derive their power from the Prince of Darkness and be acting as his agents—always excepting, of course, those miraculous powers which the church herself claimed to exercise in the name of Heaven. Moreover, as the universally coveted powers of fortune-telling, and of controlling the elements for your own benefit or the hurt of your enemies, could not be supposed to be bestowed by a being of the devil's character except as a *quid pro quo*, and as the object dearest to the devil's heart—the very aim and end, in fact, of his struggle with the kingdom of light—was to win back as many as possible of the souls that had been redeemed from his dominion by the death of Christ; it was natural to conclude that the price he would demand for his gifts would be a renunciation of Christianity and entrance into his service. Hence it came to be the established belief, that in order to acquire the powers of witchcraft, the person must formally sell his or her soul to the devil. The idea of a covenant with the Arch-enemy was not involved in the early and heathen conception of magic. Originally, magic was identical with the lowest form of religion, that is, Fetichism (q. v.). It was grounded on the idea that certain natural objects and certain rites and observances had, in themselves, a mysterious power of producing wonderful effects; and the art of the magician consisted in the knowledge of these mysterious powers, and in the skill to combine and direct them to special purposes. The effects were not conceived as being produced by the interference of any conscious being—god or devil. On the contrary, a human being could, through magical means, acquire control over supernatural beings. The Hindus carry this notion so far, that they represent some of their sages as practising austerities and performing sacrifices and other rites, until they can control the gods themselves, and even threaten their destruction along with that of the universe (see *VISVĀMITRA*). The higher kind of European magic in the middle ages was mixed up with what physical science there then was; and the most noted men of the time were addicted to the pursuit, or were at least reputed to be so. So far from deriving their power from the kingdom of darkness, the scientific magician, by the mere force of his art, could compel the occasional services of the Arch-fiend himself, and make inferior demons the involuntary slaves of his will. A belief, however, had early existed that individuals in desperate circumstances had been tempted to purchase, at the price of their souls, the help of the devil to extricate them from their difficulties (see *THEOPHILUS*); and hence a suspicion began to grow that many magicians, instead of seeking to acquire their power by the laborious studies of the regular art, had acquired it in this illegitimate way. At last, as the system of dualism above mentioned became more perfect, the art of magic was wholly diabolised, and a compact with the Evil One was thought to be the sole charter of supernatural power. See *FAUST*. This transformation took place earlier and more completely (about the 13th c.) in regard to those lower forms of the magical art which constitute witchcraft proper, and which have from ancient times been considered the special province of women. The chief cause of the prominent part assigned to the female sex in this matter is noticed in the article *MAGIC*. In addition, it may be observed, that their more excitable temperament renders them peculiarly liable to those

Ecstasies (q. v.) which have been associated with the gift of divination from the priestesses of the ancient heathen oracle down to the medium of modern spiritualism. Further, when witchcraft came to be prosecuted as heresy, the part assigned to woman in the Scripture account of the Fall led to her being looked upon as specially suited to be the tool of the devil. Founded on this circumstance, a constant element of the creed of witchcraft came to be the belief in a carnal intercourse between witches and evil spirits. The devil was supposed to tempt them in the shape of a wooer, and the unholy compact was consummated in carnal fashion.

The bargain was usually in writing, signed with the witch's own blood. She was rebaptised, receiving a new name, and had to trample on the cross and renounce God and Christ (among Roman Catholics, also the Virgin Mary) in forms parodying the renunciation of the devil in the formula of Christian baptism. A mark was impressed on some part of her body; this mark remained for ever after insensible, and was one of the means of discovery employed by the witchfinders. The powers conferred by Satan on these covenanted servants of his, were essentially the same as had always been attributed to sorcerers; the mode of exercising them was also the same, namely, by charms, incantations, concoctions, &c. The only change was in the theory. These mystic rites, instead of producing their effects by an inherent virtue, were merely symbols by which the witch conveyed her behests to the devil and his ministers, who obeyed them according to the compact. Another difference to be noted is, that the power was exclusively directed to work evil—to raise storms, blast crops, render men and beasts barren, inflict racking pain on an enemy, or make him pine away in sickness (which was usually done by making an image of wax, and sticking it full of pins, or setting it to melt away before the fire). If a witch attempted to do good, the devil was enraged, and chastised her. A remarkable circumstance is, that witches seem to have been powerless to serve their own interests, for they remained poor and miserable.

A prominent point in witchcraft was the belief in stated meetings of witches and devils by night, called *Witches' Sabbaths*. First anointing her feet and shoulders with a salve made of the fat of murdered and unbaptised children, the witch mounted a broomstick, distaff, rake, or the like, and, making her exit by the chimney, rode through the air to the place of rendezvous. If her own particular demon-lover came to fetch her, he sat on the staff before, and she behind him; or he came in the shape of a goat, and carried her off on his back. At the place of assembly, the arch-devil, in the shape of a large goat, with a black human countenance, sat on a high chair, and the witches and demons paid homage by kneeling to him, and kissing his posteriors. The feast was lighted up with torches, all kindled at a light burning between the horns of the great goat. Among the viands there was no bread or salt; and they drank out of ox-hoofs and horses' skulls; but the meal neither satisfied the appetite nor nourished. After eating and drinking, they danced to music played on a bagpipe with a horse's head for the bag, and a cat's tail for a chanter. In dancing, they turned their backs towards one another. In the intervals, they narrated to one another what mischief they had done, and planned more. The revel concluded with obscene debauchery; after which, the great goat burned himself to ashes, which were divided among the witches, to raise storms with. They returned as they came; and the husband was kept from being aware of the wife's absence by a stick being laid in the bed,

WITCHCRAFT.

which he mistook for her. The places of meeting were always such as had feelings of solemnity and awe attached to them, derived from tradition or otherwise; the more noted are known to have been places of sacrifice in heathen times (see *WAL-FURGA*).

The *prosecutions* for witchcraft form one of the most deplorable episodes in human history. They shew more strikingly than anything else has ever done, on the one hand, what relentless cruelty human nature is capable of under the influence of a fanatical delusion; and on the other, how little reliance is to be placed on the concurrence of any number of witnesses when any extensive excitement prevails on a subject involving the sentiment of wonder. Multitudes will be found testifying, and testifying honestly, to alleged facts which fall in with the prevailing belief, but have no better foundation than their own heated imaginations.

In the early laws of Rome, the Twelve Tables, there were penal enactments against him who should bewitch the fruits of the earth, or conjure away his neighbour's corn into his own field. A century and a half later, 170 Roman ladies were convicted of poisoning under the pretence of charms and incantations; which led to additional laws against such practices. But in all this, the penalties were directed against those who had done, or were believed to have done, positive injury to another; and this is probably the meaning of the Mosaic law against witchcraft. At all events, in the heathen world, the mere possessing, or being believed to possess, supernatural powers was not in itself a crime. It was feared, no doubt, as being liable to be turned to malicious purposes; but on the whole, magic was looked upon as a beneficial art, being, in fact, the only form of the healing art known, and in part also the religion of domestic life. This view of the subject continued to prevail for many centuries after the reception of Christianity. Constantine, in the 4th c., while ordaining capital punishment for those who practised noxious charms against the life or health of others, is careful to protect from prosecution all magical means used for good—such as warding off hailstorms and excessive rains (*Codex Justin.* lib. ix. tit. 18); and the distinction between *black* and *white* magic was long kept up. It was through the prosecutions directed against heresy, which were systematically organised in the 11th c. (see *INQUISITION*), that the magic arts came gradually to be all dyed black alike. Along with errors in doctrine, the heretics were almost always accused of magical practices, and their secret meetings were represented as a kind of devil-worship, attended with all kinds of abominations. Thus sorcery and heresy became synonymous; and to the dread of supernatural power was added the feeling of pious horror. White magic, no less than black, was now looked upon as the work of Satan; and the counter-charms against the malice of him and his agents were to be sought only in the rites of the church as ministered by the accredited servants of Heaven. The belief in this ecclesiastical white magic was as zealously cultivated by the Protestant clergy as by the Roman Catholic.

Fostered chiefly by the proceedings against heresy, the popular dread of witchcraft had been on the increase for several centuries; and numerous executions had taken place in various parts of Europe. At last, Innocent VIII., by his celebrated bull, *Summus Desiderantes*, issued in 1484, gave the full sanction of the church to the prevalent notions regarding sorcery, and charged the inquisitors and others to discover and put to death all practisers of these diabolical arts. Two special inquisitors, appointed for Germany (to which country the bull

was specially directed), Heinrich Institor and Jacob Sprenger, with the aid of a clergyman of Constance, Johannes Grempfer, drew up the famous *Malleus Maleficarum*, or Hammer for Witches; in which the whole doctrine of witchcraft was systematised, a regular form of trial laid down, and a course of examination appointed by which inquisitors everywhere might best discover the guilty. From this we may date the beginning of the witch-mania proper. The edict of 1484 was subsequently enforced by a bull of Alexander VI. in 1494, of Leo X. in 1521, and of Adrian VI. in 1522—each adding strength to its predecessor, and the whole serving to increase the agitation of the public mind upon the subject. The results were dreadful. A panic fear of witchcraft took possession of society; every one was at the mercy of his neighbour. If any one felt an unaccountable illness, or a peculiar pain in any part of his body, or suffered any misfortune in his family or affairs; or if a storm arose, and committed any damage by sea or land; or if any cattle died suddenly, or, in short, if any event, circumstance, or thing occurred out of the ordinary routine of daily experience—the cause of it was witchcraft. To be accused, was to be doomed; for it rarely happened that proof was wanting, or that condemnation was not followed by execution. Armed with the *Malleus Maleficarum*, the judge had no difficulty in finding reasons for sending the most innocent to the stake. If the accused did not at once confess, they were ordered to be shaved and closely examined for the discovery of devil's marks, and if any strange mark was discovered, there remained no longer any doubt of the party's guilt. Failing this kind of evidence, torture was applied, and this seldom failed to extort the desired confession from the unhappy victim. A large proportion of the accused witches, in order to avoid these preliminary horrors, confessed the crime in any terms which were dictated to them, and were forthwith led to execution. Other witches seemed to confess voluntarily, being probably either insane persons, or feeble-minded beings, whose reason had been distorted by brooding over the popular witchcraft code.

In Germany, the prosecutions were carried to a frightful extent. In the small bishopric of Bamberg, 600 fell victims to the delusion in the course of about four years; and in Würzburg, which is not much larger, 900. In the small district of Lindheim, a twentieth part of the population were sacrificed in the same space of time. Similar accounts are on record regarding the other countries of Europe. In Geneva, in three months (1515—1516), 500 persons were burned. In the district of Como, 1000 were burned in one year (1524), and 100 per annum for several years afterwards. In France, about the year 1520, fires for the execution of witches blazed in every town; and throughout the century, the provincial parliaments were incessantly occupied with witch-trials and enactments against them, especially against that form of the superstition known as Lycanthropy (q. v.; see also *WERE-WOLF*).

In England and Scotland, the witch-mania was somewhat later in setting in than on the continent; but when it did so, it was little if at all less virulent—the Reformation notwithstanding. The statute of Elizabeth, in 1562, first made witchcraft in itself a crime of the first magnitude, whether directed to the injury of others or not; and the act of James VI., in the first year of his reign in England, defines the crime still more minutely: 'Any one that shall use, practise, or exercise any invocation of any evil or wicked spirit, or consult or covenant with, entertain or employ, feed or reward any evil or wicked spirit, to or for any purpose; or take up any dead

man, &c.; such offenders, duly and lawfully convicted and attainted, shall suffer death.' Many years had not elapsed after the passing of the statute, ere the delusion, which had heretofore committed but occasional local mischief, became an epidemic frenzy, devastating every corner of England. The poor creatures who usually fell victims are thus described by an able observer: 'An old woman with a wrinkled face, a furred brow, a hairy lip, a gobber tooth, a squint eye, a squeaking voice, or a scolding tongue, having a ragged coat on her back, a spindle in her hand, and a dog by her side—a wretched, infirm, and impotent creature, pelted and persecuted by all the neighbourhood because the farmer's cart had stuck in the gateway, or some idle boy had pretended to spit needles and pins for the sake of a holiday from school or work'—such were the poor unfortunates selected to undergo the last tests and tortures sanctioned by the laws, and which tests were of a nature so severe that no one would have dreamed of inflicting them on the vilest of murderers. They were administered by a class of wretches, who, with one Matthew Hopkins at their head, sprung up in England in the middle of the 17th c., and took the professional name of *witch-finders*. The practices of the monster Hopkins, who, with his assistants, moved from place to place in the regular and authorised pursuit of his trade, will give a full idea of the tests referred to, as well as of the horrible fruits of the witchcraft frenzy in general. From each town which he visited, Hopkins exacted the stated fee of 20s., and in consideration thereof, he cleared the locality of all suspected persons, bringing them to confession and the stake in the following manner: He stripped them naked, shaved them, and thrust pins into their bodies to discover the witch's mark; he wrapped them in sheets, with the great toes and thumbs tied together, and dragged them through ponds or rivers, when, if they sank, it was held as a sign that the baptismal element did not reject them, and they were cleared; but if they floated—as they usually would do for a time—they were then set down as guilty, and doomed. He kept them fasting and awake, and sometimes incessantly walking, for 24 or 48 hours, as an inducement to confession; and, in short, practised on the accused such abominable cruelties, that they were glad to escape from life by confession. If a witch could not shed tears at command, said the further items of this wretch's creed, or if she hesitated at a single word in repeating the Lord's Prayer, she was in league with the Evil One. After he had murdered hundreds, and pursued his trade for many years—from 1644 downwards—the tide of popular opinion finally turned against Hopkins, and he was subjected, by a party of indignant experimenters, to his own favourite test of swimming. It is said that he escaped with life, but from that time forth he was never heard of again.

The era of the Long Parliament was that, perhaps, which witnessed the greatest number of executions for witchcraft. *Three thousand persons* are said to have perished during the continuance of the sittings of that body, by legal executions, independently of summary deaths at the hands of the mob. Witch-executions, however, were continued with nearly equal frequency long afterwards. One noted case occurred in 1664, when the enlightened and just Sir Matthew Hale tried and condemned two women, Amy Dunny and Rose Callender, at Bury St Edmunds, for bewitching children. It is stated that the opinion of the learned Sir Thomas Browne, who was accidentally present, had great weight against the prisoners. He declared his belief that the children were truly bewitched, and

supported the possibility of such possessions by long and learned arguments, theological and metaphysical. Yet Sir Matthew Hale was one of the wisest and best men of his time, and Sir Thomas Browne had written an able work in exposition of Popular Fallacies! Chief-justices North and Holt were the first individuals occupying high places who had at once the good sense and the courage to set their faces against the continuance of this delusion, and to expose the general absurdity of such charges (1694). Summary executions, however, continued for some years to be still common, in consequence of confessions extracted after the Hopkins fashion. In 1716, a Mrs Hicks and her daughter, aged nine, were hanged at Huntingdon for selling their souls to the devil, and raising a storm by pulling off their stockings and making a lather of soap! With this crowning atrocity, the catalogue of murders in England closes.

In Scotland, witchcraft as a crime *per se* was first made legally punishable by an act passed in the reign of Mary (1563). On coming to execute the functions of majesty, James VI. made numerous official investigations into alleged cases of witchcraft, and derived a pleasure in questioning old women respecting their dealings with Satan. In 1590, James, it is well known, made a voyage to Denmark to bring home his appointed bride, the Princess Anne. Soon after his arrival, a tremendous witch-conspiracy against the happy conclusion of his homeward voyage was discovered, in which the principal agents appeared to be persons considerably above the vulgar. The king had all the accused brought before himself for examination, and even superintended the tortures applied to them to induce confession. One of them, Mrs Agnes Sampson, declared that one great object with Satan and his agents was to destroy the king; that they had held a great witch-convention at North Berwick for no other end; and that they had endeavoured to effect their aim on many occasions, and particularly by raising a storm at sea when James came across from Denmark. The witches demanded of the devil why he bore such hatred to the king, who answered that the king was the greatest enemy he had in the world. On this occasion, 30 persons were executed on the Castle-hill of Edinburgh. These proceedings, no doubt, gave occasion to the famous work on Demonology which James VI. published shortly after. The removal of James to England moderated but did not altogether stop the prosecutions. As the spirit of Puritanism gained strength, however, they again increased. The General Assembly was the body in fault on this occasion, and from this time forward, the clergy were the great witch-finders in Scotland. The Assembly passed condemnatory acts (1640, 1643, 1644, 1645, 1649), and with every successive act the cases and convictions increased with even a deeper degree of attendant horrors than at any previous time. At a single circuit held at Glasgow, Stirling, and Ayr in 1659, 17 persons were convicted and burned for this crime. The popular frenzy seems to have exhausted itself by its own virulence in 1661—1662. After this period, the dying embers of the delusion only burst out on occasions here and there into a momentary flame. The last regular execution for the crime is said to have taken place at Dornoch in 1722, when an old woman was condemned by David Ross, sheriff of Caithness. The number of victims in Scotland from first to last has been estimated at upwards of 4000.

In the British colonies of New England, the witchcraft mania raged with peculiar intensity. As in Scotland and elsewhere, the clergy were the prime movers. Two clergymen have obtained a

special and unenviable notoriety for the part they acted in this matter. The one was the Rev. Cotton Mather (q. v.), a man who was considered a prodigy of learning and piety, but whose writings and proceedings in regard to the trial and execution of witches, of which he was the chief instigator, shew a degree of fanaticism, credulity, and blind cruelty that is almost incredible. The other, a Samuel Parris, minister of Salem, made use of the popular feeling to gratify his own spite at individuals. At last, in the 'Salem tragedy,' as it is called, in 1692, the executions, torturings, and imprisonments rose to such a height as to be no longer endurable, a complete revulsion of public feeling took place, and the delusion was broken. For details of New England witch-trials, we must refer to No. 26 of *Chambers's Repository of Tracts*.

Dr Sprenger, in his *Life of Mohammed*, computes the entire number of persons who have been burned as witches during the Christian epoch at nine millions.

Throughout the middle ages, it is doubtful if one person could have been found who doubted the reality of witchcraft; and it was not till the middle of the 16th c. that any one had courage to raise his voice against the enormities which the delusion was occasioning. The first, probably, to do so was a physician of the name of J. Weier (*De Præstigiis Dæmonum*, &c.), in Germany, in 1563. He was followed in 1584 by Reginald Scot (q. v.), 'a solid and learned person, beyond almost all the English of that age' (Hallam), who demonstrated the absurdity and impossibility of the prevalent notions. The delusion, however, was still in the ascendant, and found multitudes of defenders, who branded the sceptics as 'Sadducees.' The most prominent of these champions was James VI. of Scotland, who, through his treatise on Demonology (1597), and his activity in the inquisition of cases, is entitled to rank with Pope Innocent and the inquisitor Sprenger, as at the same time a chief enemy and chief encourager of witchcraft. At last the world began to awaken from the horrid nightmare; the feelings of the humane began to be shocked by the continued butchery, and the more intelligent to question, if not the existence of witchcraft, at least the evidence on which the accused were for the most part condemned. Advocates took courage to defend a reputed witch, and judges, like North and Holt in England, to throw cold water on the proceedings; and the frenzy gradually subsided all over Europe. Individual cases occurred later on the continent than in Britain. A man was executed at Würzburg in 1749 on a charge of sorcery; and a witch was burned at Glarus, in Switzerland, in 1782. Perhaps the latest instance of a judicial execution for witchcraft occurred in 1793, in the grand duchy of Posen. The laws against witchcraft were formally repealed in England in 1736, in Austria not till 1766.

The cessation of judicial proceedings, however, did not all at once put an end to popular outrages on supposed witches. In 1751, an aged female pauper and her husband were killed by a mob near Tring, in Staffordshire; and for the murder, one of the perpetrators was tried and executed. Not longer ago than 1863, a reputed wizard was drowned in a pond at the village of Hedingham, in Essex; and it was considered worthy of notice that nearly all the sixty or seventy persons concerned in the outrage were of the small-trade class, none of the agricultural labourers being mixed up in the affair. Besides such violent outbreaks, striking revelations are frequently made in the course of judicial proceedings, how deep-seated and general the dread of witches continues to be throughout the more ignorant strata of European society, especially in rural

places; and, concurrent with this, the faith in the skill of certain 'wise men' and 'wise women' (white witches) to counteract their malicious practices. As recently as March 1867, a man calling himself Dr Harris (S. Wales) was committed for trial at the next Radnorshire Assizes, for duping various persons, by persuading them that their ailments were caused by their being 'witched,' and pretending to cure them by giving them written charms to wear. From one man he had extorted £4, from another £6, and so on.

The belief in magic or sorcery, in fact, continues to be the most energetic belief of the ignorant and degraded all over the world, no matter what their nominal religion is. To the mass of the adherents of Buddhism in Central Asia, the lama or priest is merely a wizard who knows how to protect them from the malignity of evil spirits; and, according to Livingstone and other travellers, trials and executions for witchcraft are at this day common throughout Africa, as they were in Europe in the 17th c., and under forms ludicrously similar. See ORDEAL, MAGIC.

Of the numerous books written about witchcraft, we note the following: *Sadducismus Triumphatus, Sadducismus Vanquished, or, Considerations about Witchcraft*, a work vindicating the belief in witchcraft, by Dr Joseph Glanvil, Chaplain-in-ordinary to Charles II., who was one of the first Fellows of the Royal Society, and wrote a meritorious treatise shewing the value of scepticism in science. R. Baxter (q. v.), in his *Certainty of the World of Spirits*, upholds the same side. Balthazar Bekker, a Reformed Dutch clergyman, was the first, at the end of the 17th c., to attack the very foundation of the superstition—namely, the belief in the devil himself, or, at all events, in the possibility of his interference in the affairs of this world. A successor of Glanvil, D. F. Hutchinson, chaplain to George I., in his *Historical Essay concerning Witchcraft* (1718), writes from the sceptical point of view. Sir W. Scott, *Letters on Demonology and Witchcraft*, entertaining but superficial. Brand's *Popular Antiquities of Great Britain*, edited by Sir H. Ellis (1855), gives a collection of witch-beliefs put together without much connection or method. H. Williams's *Superstitions of Witchcraft* (1865) takes a wide historical view of the subject, and evinces extensive reading: although loosely put together, and a good deal spoiled by the ambition of fine writing and the display now and then of narrow Protestant feeling, it is on the whole one of the best books on the subject in English. C. Mackay gives a good digest of it in brief space in a section of his work on *Extraordinary Popular Delusions* (1841). Thomas Wright, *Narratives of Sorcery and Magic*, 2 vols. (1852), contains a large collection of the most interesting stories of individual cases. Soldan, *Geschichte der Hexenprocesse* (History of Witch-trials), (Stut. 1843). Garnet, *Histoire de la Magie en France*. Ennemoser, *Geschichte der Magie*, 2d ed. (Leip. 1844); translated by W. Howitt (Lond. 1854). L. F. Alfred Maury, *La Magie et l'Astrologie dans l'Antiquité et au Moyen Age* (Lond. 1860), attempts to give a philosophy or theory of all superstitious beliefs. J. Grimm, *Deutsche Mythologie*, with his wonted sagacity and prodigality of learning, traces the several elements of the witch-creed to their roots in the beliefs of pagan times.

WITCH-HAZEL (*Hamamelis Virginica*), a North American shrub of the natural order *Hamamelidaceæ*. This order contains only a very small number of species, much diffused over the world, but none of them European; shrubs or small trees, with alternate, stipulate, feather-veined leaves, and small axillary unisexual flowers. The W. is

often not more than 6 or 8 feet in height, dividing at the base into several cylindrical grayish branches. Sometimes it attains a height of 20 or 30 feet. The leaves are about four inches long, and two or three broad. The flowers are clustered, yellow and showy, with long linear petals. They appear in winter, or at the season when other trees and shrubs are parting with their leaves. The English name is derived from the supposed virtues of a forked twig as a divining-rod. The bark is much esteemed as a sedative and discutient.

WITENA-GEMOT (A.-S. *witena*, genitive plu. of *wita*, a wise man, from *witan*, to know, and *gemót*, assembly, from *metan*, to meet), the great national council of England in Anglo-Saxon times, by which the king was guided in all his main acts of government. Each kingdom had its own Witena-gemót before the union of the Heptarchy in 827, after which there was a general one for the whole country. It was composed of the chief ecclesiastics, the ealdormen (see ANGLO-SAXONS) of shires, and some of the chief proprietors of land. It would rather appear, though the matter is not quite free from doubt, that the lesser thanes, who formed part of the *scr-gemót*, or next inferior court, were not entitled to form part of the general council. In the year 934, there were present at one of these assemblies King Athelstane, four Welsh princes, two archbishops, seventeen bishops, four abbots, twelve dukes, and fifty-two thanes.

The powers of the Witena-gemót seem to have been very extensive. The king's title, however hereditarily unexceptionable, was not considered complete without its recognition, and it possessed the power of deposing him. It could make new laws and treaties; and along with the king it appointed prelates, regulated military and ecclesiastical affairs, and levied taxes. Without its consent, the king had no power to raise forces by sea or land. It was also the supreme court of justice, civil and criminal. The Witena-gemót was abolished by William the Conqueror, and its powers were only in part transmitted to parliament.—See Hallam's *Middle Ages*, c. 8; Sir F. Palgrave's *Rise and Progress of the English Commonwealth*; and Kemble's *Saxons in England*.

WITHER, GEORGE, was born on the 11th June 1588, at Bentforth, an estate in Hampshire of which his father was proprietor, and which in due course fell to the son. He was educated at the grammar-school of Colemore, and afterward at Magdalen College, Oxford, which he entered in 1604. He remained there several years, and after passing some time at home, he went to London, and entered himself at Lincoln's Inn. His bent was, however, rather to literature than law; and he shortly became known in certain circles as a writer of clever verses. In 1613, he came before the public in a volume of satire, the title of which, *Abuses Stript and Whipt*, in some sort defines its contents. Certain things in the book were considered offensive by the authorities, and he was sent to the Marshalsea prison, and kept there for some months. During his imprisonment were composed his *Satire to the Kings* and his *Shepherds' Hunting*. In 1622, appeared a collection of his poems under the title *Mistress of Philarete*, and in 1635, his *Emblems, Ancient and Modern*. Though he had very much identified himself with the party of the Puritans, among whom his writings were most popular, on the breaking out of civil disturbance, he served as a captain of cavalry in the ill-judged and abortive expedition of Charles I. against the Scotch Covenanters in 1639. When a little later, however, the general discontent deter-

mined itself into the grand struggle between the king and the English parliament, he promptly sided with the latter, and raised a troop of horse for its service by the sale of his estate. In the army of the parliament he attained the rank of major; but of his special services not much is known. On one occasion he was taken prisoner, and is said to have owed his life to a joke of Denham's, who besought the royalists to spare his life, on the ground that so long as W. lived, he (Denham) was not the worst poet in England. On the final triumph of the side with which he had ranged himself, it appears that opportunities were afforded him of feathering his nest rather comfortably by the spoil of the defeated party. With the Restoration naturally a reverse came; and as the reputed author of a pamphlet entitled *Vox Vulgi*, of a so-called seditious tendency, he was committed to the Tower, and an impeachment of him having been ordered, his life for a time seemed to be in some danger. The impeachment was not, however, proceeded with, and sooner or later—the date seems somewhat uncertain—he obtained his liberty. He died in London on 2d May 1667.

W. was an excessively voluminous writer. Upwards of 100 separate publications of his have been noted by modern bibliographers (see list and 2d vols. of Park's *British Bibliographer*), yet, after his death, his poetry fell into oblivion, or, so far as remembered, was regarded with such contempt that we find him introduced by Pope in the *Dunciad*, as 'wretched Withers.' A later time has, however, revised this decision; the grace, sweetness, fancy, and charm of natural simplicity which distinguish not little of his verse have since been sufficiently recognised; and a modest niche in the temple has been accorded him, from which he cannot now be degraded. The men to whom the resuscitation of his fame is chiefly owing are Southey, Lamb, and Sir Egerton Brydges. In his *Shepherds' Hunting*, in particular, passages occur of such rare and finished beauty, that no collection of the choicest things in English poetry could be held to be complete which should omit them. His *Hymns and Songs of the Church* were edited, with an introduction, by Mr Ed. Farr in 1856. By far the best and most complete account of W.'s life and writings is to be found in Wilmott's *Lives of the Sacred Poets* (Lond. 1834).

WITNESS, a person summoned, or capable of being summoned, by a court of law, or some officer authorised to take evidence relating to a judicial or other proceeding. All persons are liable to be witnesses, either voluntarily or involuntarily, and it is a duty which every citizen owes to his fellow-citizens, to be available whenever his testimony is deemed desirable. It is a compulsory duty, and the presence of any person can be enforced, both in civil and criminal cases. In England, the usual mode of summoning a witness in a court of law, is by serving him with a *subpœna*, i. e., a formal writ proceeding in the Queen's name, reciting that a certain action is pending in a court named, and a trial is to take place, and commanding the witness to lay aside all and singular business and excuses, and appear at the time and place before the court mentioned, under a penalty (*sub pœna*) of £100. This is called a *subpœna ad testificandum*. The corresponding term in Scotch law is Diligence (q. v.). If the witness is required to produce a document in his possession, it is called a *subpœna duces tecum*, and he is told in the writ to bring the document. If a witness do not attend at the time and place mentioned, he is liable to be punished, either by attachment, i. e., summary imprisonment for contempt, or by an action for damages at the suit of the party summoning

him. The subpoena, or notice to attend, must be served a reasonable time before the witness is wanted, and it is generally necessary to give a day's notice beforehand. During a witness's attendance on this public duty, he is privileged from arrest: thus, he cannot be taken into custody for debt while he is going to, remaining at, or returning from the court. Moreover, he is entitled, before he go to the court, to have his reasonable travelling expenses paid to him, and a sum for subsistence while he remains in attendance. He is also entitled to a reasonable allowance for his lost time while attending a civil trial, and courts of law allow 5s. per day to a labourer or journeyman, 7s. 6d. to a master-tradesman, and £1, 1s. to £3, 3s. to professional men; to females, according to their station in life. A witness may, in a civil case, but not in a criminal case, refuse to give evidence until his expenses are paid. A witness, before examination, is required to take an oath, which may be in any form which he considers most binding on his conscience; but he must at least believe in a God and a future state of rewards and punishments. When a witness is examined, he is generally asked specific questions, first, by the party calling him, and during this examination in chief, the rule is that he is not to be asked leading questions, i. e., questions which suggest the answer that is required. The opposite party is then allowed to cross-examine the witness, and in doing so, may ask leading questions, or test in every way the truth of the witness's statement. After this, the witness is re-examined. There is a technical rule that the party calling a witness is not allowed to impeach his credit, or ask anything having that effect. There are certain questions which a witness may refuse to answer. Such are questions the answer to which might render the witness liable to a criminal charge or penalty; but he cannot refuse if the effect would merely be to render him liable to a civil action, or merely to degrade him. If a witness live in a foreign country, he cannot be compelled to come to this country by any subpoena, and therefore the only way of getting his evidence is to send a commission to some person in the foreign country to take the examination there. Where, however, a witness residing in Scotland is required for a trial in England, and *vice versa*, he may now be compelled by subpoena to attend in the same way as if he had resided in England or Scotland respectively. If the witness is aged or infirm, so that his attendance at the trial would be dangerous to him, he may be examined by a commissioner or examiner before trial. In England, when a witness is sworn, a New Testament is put in his hand, and after the officer of court repeats the form, he kisses the book. The form is: 'The evidence you shall give to the court and jury, touching the matter in question, shall be the truth, the whole truth, and nothing but the truth.' When the witness is a Jew or foreigner, the form varies. In Scotland, the witness, when sworn, stands, holding up his right hand, while the judge of the court repeats this form: 'I swear by Almighty God, as I shall answer to God at the great day of judgment, that I shall tell the truth, the whole truth, and nothing but the truth, in so far as I know or shall be asked.'

WITNEY, a small market and manufacturing town of Oxfordshire, in a dreary district on the Windrush, 10 miles west-north-west of Oxford. It is a neat and well-built town, consisting principally of two streets. There is a spacious cruciform church, a blanket-hall (built 1721), a town-hall, and cross (1683). It is celebrated for its blankets, which are distinguished for their peculiar whiteness, communicated, it is said, by the sulphureous qualities of the waters of the Windrush, used in their manu-

facture. This branch of industry has, however, somewhat declined, from the introduction of machinery for blanket-making in other towns. Gloves, malt, pilot-cloths, and felting for paper are also manufactured. The Saxon form of the name is *Witaneye*, and means, 'the island of the Wise Men,' or 'the island of the parliament.' W. is connected by a branch with the Great Western Railway. Pop. (1861) 3458.

WITTEKIND, a Westphalian chieftain, the most celebrated leader of the Saxons against Charles the Great, made his first appearance as leader in the expeditions which the Saxons undertook in 774 against the fortress of Kresberg, in Westphalia, and the Frankish province of Hesse, while Charles was subduing the Lombards. When most of the Saxon nobles submitted to the Emperor Charles at the imperial diet at Paderborn in 777, W. fled to Siegfried, king of Jutland, whose sister Geva he is said to have married. In 778, he returned, and when Charles was absent in Spain, began to lay waste the Rhine country. Charles's return obliged him again to take refuge in Jutland; but in 782 he fell upon the Frankish army by surprise at the Sintelberg, and entirely annihilated it—an act for which Charles took frightful vengeance by the execution of 4500 Saxons. On this, all the Saxon tribes rose in arms, and the war was again led by W. until 785, when Charles entered into negotiations with him, the result of which was, that W. repaired to the emperor's camp at Attigny in Champagne, and received baptism. After that, he appears no more in history. According to the legend, however, that is still current among the people in Westphalia, Charles promoted W. to be Duke of the Saxons, and made over Engers to him. From his castle called Babilonia, situated in the neighbourhood of Lübeck, he is said to have ruled with gentleness and justice till 807, when he met his death in a campaign against Duke Gerold of Swabia. His bones repose in the parish church of Engers, in the duchy of Ravensberg, where Charles IV., in 1377, erected a monument to him; and on October 18, 1812, another monument in his honour was erected at Minden by the Westphalian Society. The higher of the two hills which form the Westphalian gates on the Weser, near Minden, bears the name of Wittekindsberg.

WITTENBERG, a town of Prussian Saxony, a fortress of the third rank, stands on the right bank of the Elbe, 55 miles south-west of Berlin, and 59 by railway. It is interesting as having been the capital of the electorate of Upper Saxony, as the cradle of the Reformation, and as containing the remains of the reformers Luther and Melancthon. The once famous university, in which Luther was professor, and mentioned by Shakspeare as the school where Hamlet studied, is now removed and incorporated with that of Halle. In the *Stadt-Kirche* are two remarkable but poor pictures supposed to be by their contemporary and friend Cranach, in one of which Melancthon is represented as dispensing the sacrament of baptism, and Luther as preaching to a congregation, of which the two foremost figures are his wife and son. In the *Schloes-Kirche* are the tombs of Luther and Melancthon, as well as those of Frederick the Wise (with a noble bronze statue by Vischer) and John, electors of Saxony. Upon the doors of this church—burned down by the French, but replaced by others of metal—Luther hung up his 95 theses against the papal doctrine of indulgences. The house of the great Reformer, containing his chair, table, &c., and two portraits of him by Cranach, remains almost unaltered. The houses of Melancthon and Cranach are also shewn. In the market-place is a bronze

statue of Luther by Schadow; and outside the Elster Gate, a spot is pointed out as the place where Luther burned the papal bull. Manufactures of woollen and linen goods, hosiery, and leather are carried on. Brandy is distilled, and beer brewed. Pop. (1864) 13,083.

WOAD (*Isatis*), a genus of plants of the natural order *Cruciferae*, having a 1-celled, 1-seeded, laterally compressed pouch, with the valves keeled and eventually separating.

Dyer's Woad
(*Isatis tinctoria*).

It contains only a few species, mostly natives of the countries around the Mediterranean. DYER'S W. (*I. tinctoria*) is sometimes found in cultivated fields in England, but most probably has been introduced, as it was formerly much cultivated both in England and Scotland, for the sake of a blue dye obtained from its root-leaves. The use of this dye has in great part ceased, in consequence of the more general introduction and diminished cost of indigo. Dyer's W. is a biennial plant, with oblong crenate root-leaves about a foot in length, on pretty long stalks; an upright, much branched leafy stem, about 3 feet high; small yellow flowers, and large seed-vessels, about half

an inch long and 2 inches wide, hanging from slender stalks. The leaves when cut are reduced to a paste, which is kept in heaps for about fifteen days to ferment, and then formed into balls which are dried in the sun, and which have a rather agreeable smell, and are of a violet colour within. These balls are subjected to a further fermentation before being used by the dyer. When W. is now used, it is always in union with indigo, which improves the colour. Even by itself, however, it yields a good and very permanent blue. It is supposed that W. was the dye used by the Picts for painting their persons. W. is now cultivated only to a very small extent in Britain.

WOBURN, a township of Massachusetts, U. S., 10 miles north-north-west of Boston, on the Boston and Lowell Railway, containing numerous factories supplied with water-power, country residences of wealthy Bostonians, 8 churches, academy, &c. Pop. in 1860, 6773.

WODEN. See ODIN.

WODROW, ROBERT, the second son of James Wodrow, professor of divinity in the university of Glasgow, was born at Glasgow in the year 1679. He was educated at the university of his native city, and after passing through the classes in arts, studied theology under his father. At an early age he devoted a considerable portion of his time to historical researches, and to this taste he probably owed his appointment as librarian to the university. He did not hold this office long. Having finished his theological studies, in the year 1703 he received a license to preach from the presbytery, and in the month of October of the same year was appointed minister of Eastwood, a parish in the county of Renfrew, at no great distance from Glasgow. In that parish he remained till his death, faithfully discharging the duties of his office, and declining

offers which were made to him of appointments to pastoral charges of more importance. He had been brought up in the strictest principles of presbyterianism, and he zealously adhered to the party in the Established Church, which was most strenuous in maintaining those principles, and in resisting what were deemed to be the encroachments of the secular power. Soon after his settlement at Eastwood, he began to devote his leisure hours to what became the chief object of his life—the writing of a history of the Church of Scotland from the Restoration to the Revolution. He spared no pains and no expense, so far as his limited means could afford, in collecting materials for this work. He corresponded with all persons who could give him any information, and transcribed with his own hand the civil and ecclesiastical records bearing on his subject. The work was published in two folio volumes, the first in 1721, and the second in the following year. It was dedicated to King George I., whom the author styles 'the best as well as greatest of kings;' and in the year 1725 he received an order on the Scottish exchequer for £105, as a mark of the royal bounty. It is probable that this sum was the chief pecuniary recompense of his labours; but considerations of that nature formed no part of the inducements which had led him to undertake the work. A second edition of the history, in 4 vols. 8vo, was published at Glasgow in 1828, under the editorship of Dr Robert Burns. W. contemplated other works, chiefly of a biographical character, illustrative of the ecclesiastical history of Scotland. None of these were published till the present century. Two vols. of his collections on *The Lives of the Scottish Reformers and most eminent Ministers*, and 4 vols. entitled *Analecta; or, a History of Remarkable Providences*, have been printed by the Maitland Club. Three volumes of his correspondence were published by the Wodrow Society—a literary club called after his name, and instituted in 1841 for the publication of the works of the fathers and early writers of the Reformed Church of Scotland. This correspondence, which extends from the year 1709 to the year 1731, throws much light on the ecclesiastical history of the time, and contains letters addressed to persons of some note in their day, not only in Scotland, but in England, Ireland, and North America. W.'s health was impaired by the eagerness with which he prosecuted his laborious studies. He died on the 21st of March 1734, in the 55th year of his age. His great work—the one by which his name is generally known—is the history. It is what it professes to be in the title-page, a 'History of the Sufferings' of the Presbyterian Church, rather than an ecclesiastical history of the period. This of itself implies a one-sided character, and warns its readers that they need not expect an account of events not coming within its limited range. Of its great value as a storehouse of materials to the student of Scottish history, no one who has examined its pages can have a doubt. As little hesitation will there be in regard to the absence of every grace of style. The only question will be as to the degree of credit to be given to the facts which the writer relates. So far as concerns his fidelity in transcribing records, and incorporating in the text the narratives furnished to him, there is no reason to doubt his general accuracy. But beyond this nothing can be said. His credulity was so great as to make him entirely unable to give any weight to intrinsic improbabilities or the conflict of external evidence. He could rarely admit a fault in those of his own side, and it is hardly an exaggeration to say that he could never see a virtue in his opponents. Much of his history is gathered from the records of the Privy Council of Scotland, and

an examination of these valuable and voluminous papers will make it pretty evident that W. disingenuously neglected to extract particulars which tell against his party. It is obvious, therefore, that in the perusal of his work, allowance must be made, not only for the absence of whatever does not come within its proper subject, but also for exaggerations of the virtues and sufferings of one party, and the crimes and errors of the other. The fullest memoir of W. is that which is prefixed by Dr Burns to his edition of the history. Interesting details of his domestic life and of his labours and studies will be found in the printed volumes of his correspondence.

WOJWODA (Polish, *Wojewoda*), an old Slavonic word (composed of *woi*, warrior, and *wodit*, to lead), means, literally, army-leader or general, and was from early times used by most Slavonic nations in this sense. Afterwards, it became the title of the elective princes before hereditary monarchies were formed. Thus, at one time, the princes of Walachia and Moldavia were called Wojwodas; from the Greek emperors, with whom they had been in intimate alliance from the year 1439, these princes next received the title of Despots, a title they afterwards exchanged for that of Hospodar. The name was also given to the elective princes of Transylvania, whether dependent or independent. The same title of Wojwoda was applied to the elective chiefs of the Polish government before the beginning of the Piast dynasty. Later, the name denoted office and dignity; and was given, in the former kingdom of Poland, to the governors in the districts, or Wojwodschafft, into which the kingdom was divided. They had at first only a military authority; afterwards, however, both the civil and military were united in one person, so that Wojwoda and Palatine were one and the same. The name of Wojwodschafft was preserved in Russian Poland till recent times; now the Polish Wojwodschafft are named uniformly with the other Russian 'governments.'

WOJWODSCHAF (or **WOJWODINA**) OF **SERVIA**. See **BANAT**.

WOKINGHAM, or **OAKINGHAM**, a small but improving market-town of Berks, 7 miles south-east of Reading, at the junction of the Reading and Staines and the Reading and Guildford Railways. Shoes are made, and gauze and silks woven. In the original *Rose* inn, Gay, Swift, Pope, and Arbuthnot, being detained here by wet weather, composed among them the old song of *Molly Mog*. All Saints' Church, a magnificent building, lately restored, is remarkable for its massive chalk pillars. W. is the only town in Windsor Forest. The ancient amusement of bull-baiting was continued here until within the last 25 years. Pop. (1851) 2272; (1861) 2404; (1866) 2600.

WOLCHOV, or **VOLKHOV**. See **ILMEN**, **LAKE**, and **LADOGA**, **LAKE**.

WOLCOT, **DR JOHN**, better known under the pseudonym of *Peter Pindar*, was born at Dodbrooke, in Devonshire, in 1738. He was educated at the charge of his uncle, a respectable surgeon and apothecary of Fowey, in Cornwall. After studying medicine at the London hospitals, he accompanied Sir William Trelawny to Jamaica in the capacity of medical attendant; but finding his professional income too small for his wants, he solicited and obtained a church-living in the island. His congregation consisted mostly of negroes, and Sunday being their principal holiday and market, the attendance at church was very limited. Sometimes not a single person came; and W. and his clerk—the latter being an excellent shot—used at such times, after waiting for ten minutes, to proceed to

the seaside, to enjoy the sport of shooting ring-tailed pigeons. The death of his patron, Trelawny, induced him to abandon both Jamaica and the church. Returning to England, he tried to establish himself as a physician at Truro, in Cornwall, but does not appear to have succeeded. At anyrate, he soon removed to London, where he gave himself up to writing audacious squibs and satires in verse, on all sorts of persons, from King George III down to the Liverymen of London, and even lower. W.'s line in literature is not a very respectable one, and most people would probably prefer obscurity to a reputation like his; but, to do him justice, Peter Pindar is an excessively clever writer. Unscrupulous, impudent, and coarse, he is yet a master of burlesque humour and comic caricature: his verse is easy, vigorous, and idiomatic; and his fancy rich in the production of ludicrous metaphor. Two of his raciest pieces, levelled at his sovereign, are *The Apple-dumplings and a King*, and *Whitbread's Brewery Visited by their Majesties*. Besides these, we may mention his *Lyrical Odes* on the Royal Academy Exhibition (the earliest of his London efforts, and dating from 1782); *Bozzy and Pizzy, or the British Biographers*; *Peeps at St James's*; *Epistle to a Fallen Minister*; *Odes to Mr Paine*; and the *Louisiad*, a *Heroi-comic Poem*, in five cantos; &c. The *Louisiad* has its foundation in the fact, that an obnoxious insect had been discovered in the king's plate among some green peas, which produced a solemn decree that all the servants in the royal kitchen were to have their heads shaved. Some of W.'s serious effusions actually possess considerable merit. If the matter, or rather the themes of his verse, had been less worthless, it would have stood a better chance of permanent popularity. In his own lifetime, his pieces were greedily read, and he had an annuity from the booksellers of £250 for the copyright of them. He was considered so formidable a personage, that the ministry are said to have endeavoured to bribe him into silence. W., who records this proof of his power, also asserts the incorruptibility of his patriotism. He died 14th January 1819.

WOLF, **FREDERICK AUG.**, the most gifted classical scholar and first critic of his age, was born 15th February 1759, at Haynrode, near Nordhausen. He was brought up and educated with great strictness by his father, the leader of the choir and organist of the place; but was afterwards sent to the gymnasium at Nordhausen. Here, under the training of the rector Hake, were developed in him not only that restless ardour for the thorough study of the ancient languages which actuated him throughout life, but also, what was afterwards the predominating trait of his character, the habit of inquiring and judging for himself, and of pursuing only one object at a time. Before leaving the gymnasium for the university, he had read the principal ancient authors, as well as the French, Italian, Spanish, and English; and had also perfected himself in the theory and practice of music. At the university of Göttingen, which he went to in 1777, with the intention of studying philology exclusively, he attended the lectures very irregularly, being already much given to private study. For the rest, he lived very retired, was little visited or known, and was only intimate with a few. However, he gave lessons to several students in Greek and also in English, for which he published Shakespeare's *Macbeth*, with explanatory notes (Gött. 1778). From Heyne (q. v.), who had once excluded him from hearing a course of lectures on Pindar, on account of the irregularity above noticed, he kept himself quite aloof. In order, however, to commend himself to a man who had so much influence as Heyne had, he laid before him,

shortly before his departure in 1779, a dissertation, containing some novel views regarding the Homeric poems; which, however, Heyne coldly returned. In the same year, he went as teacher to the Pædagogium at Ilfeld, and there first established his fame by an edition of the *Symposium* of Plato, with notes and introduction in German. In 1782, he was appointed to the rectorship of the High School at Osterode, in the Harz; and, in 1783, accepted an invitation to Halle, as professor of philosophy and of pedagogical science. In Halle, W. had at first difficulties to encounter, as he rather estranged than attracted students by the high tone of his teaching. However, he soon learned to adapt himself to his audience, and then the crowd of eager pupils was very great. As academical teacher, he went on the principle that classical antiquity should be looked upon chiefly as serving for a model of what is noblest and greatest in public and private life, and as such, is to be employed as a medium of education. He made it the principal duty of his office to provide able teachers and superintendents for the schools of his native country, and to deliver education, as much as possible, from the scientific pedantry of the old school of pedagogues. Literary labours and fame he looked upon more as a subordinate object; and his effectiveness as a teacher was unparalleled during the twenty-three years he lived at Halle. He nevertheless established his reputation as a scholar and critic by an edition of Demosthenes's *Oratio adversus Leptinum* (1789), which attracted much attention, and still more by his celebrated *Prolegomena ad Homerum* (1795), in which he unfolded, with prodigious learning and acuteness, his bold theory, that the *Odyssey* and *Iliad* are composed of numerous ballads or rhapsodies by different minstrels, strung together in a kind of unity by subsequent editors (see HOMER). This work made a great sensation through the whole of Europe. Some scholars gave out that they had long entertained similar notions regarding the Homeric poems; and Heyne insinuated that the *Prolegomena* were only a reproduction of what W. had heard at Göttingen. This gave rise to the spirited *Briefe an Heyne* (Letters to Heyne, Berl. 1797), of which the first three may be considered as models of scholarly polemic and fine irony. Some years afterwards W. published the text of the four orations of Cicero, whose genuineness had been called in question by Markland in England—namely, *Post reditum in Senatu, Ad Quirites post reditum, Pro domo sua ad pontifices, De haruspicum responsis*—appending the previous controversy, and adding striking observations of his own in proof of their spuriousness. He next went still further, and attacked the authenticity of the oration *Pro Marcello*, which had long been studied by the Ciceronians as a model of eloquence and style, pronouncing it to be mere inflated declamation, in a diction hardly Latin, and which Cicero never could have written. This audacious scepticism produced no little alarm. After having refused a call in 1796 to Leyden, in 1798 to Copenhagen, and in 1805 to Munich, his position was considerably improved, and he received the title of Privy-councillor. After the disasters of 1806, the university at Halle was dispersed, and W. was for a time reduced to great straits. However, he soon found a suitable position as member of the Academy of Sciences at Berlin, where he took an active part in the reorganisation of the university, and became a professor. He was taken into the Ministry of the Interior as member of the section for public instruction; but, finding that the duties interfered with his time and strength for teaching, which he considered his mission, he continued only a short time in public office. He next gave up the

work of an ordinary professor, and reserved at last only the privilege of lecturing in the university on such subjects as he chose. For the benefit of his health he took a journey to the south of France in April 1824, and died at Marseille, 8th August 1824. The multitudinous works of W. we cannot attempt to enumerate. They consist chiefly of critical editions of classical writings, with dissertations and annotations, and often with admirable translations either in German or Latin. While in Berlin he edited, along with Buttmann, the *Museum der Alterthumswissenschaften* (1807—1810), and afterwards the *Literarische Analecten* (1817—1820), which has been pronounced perhaps the best philological journal that has ever been published, and which contains, among other papers by W., a long notice of Richard Bentley. From the papers which he left, his son-in-law, Körte, published *Ideen über Erziehung, Schule und Universität* (Ideas on Education, School and University; Quedlinb. 1835).—See Hanhart, *Erinnerungen an Fr. Aug. W.* (Bas. 1825); Körte, *Leben und Studien Fr. Aug. W.'s des Philologen* (2 vols. Essen. 1833); Gottholdt, *Fr. Aug. W. die Philologen und die Gymnasien* (Königsb. 1843).

WOLF, JOHANN CHRISTIAN VON, a celebrated philosopher and mathematician, was born in 1673, at Breslau. His father, a rather poor but well-informed artisan, made it his chief object to give a good education to his son, who at an early age shewed excellent abilities. W. received the elements of his education at the gymnasium of Breslau, and went to Jena in 1699 to study theology. However, mathematics and philosophy were his favourite sciences, and to them he almost exclusively devoted himself. In particular, he studied Descartes and Tschirnhausen's writings, to whose *Medicina mentis* he wrote annotations, which brought him into connection with Leibnitz. In 1703, he delivered at Leipzig a graduation disputation, *De Philosophia Practica Universali, Methodo Mathematica Conscripta*, which made a very favourable impression, and then began to give lectures in mathematics and philosophy, which were very numerously attended. By various works which he published on special branches of mathematics, his name became celebrated even in foreign countries. When the incursion of Charles XII. into Saxony obliged him to leave Leipzig, he received, on the recommendation of Leibnitz, a call to Halle, as professor of mathematics and natural philosophy. He there acquired great celebrity by his systematical method of teaching, as well as by numerous mathematical writings. The clearness and definiteness of the ideas and propositions which he exhibited in his mathematical lectures, were something till then quite unknown. Hence it came that his system of metaphysical and moral philosophy, which he worked out according to this mathematical method, and published, met with universal approbation, and quickly spread through Germany: it became a kind of rage to treat all sorts of subjects in the mathematical method, the effect of which was often ludicrously pedantic. W., however, was violently attacked by his colleagues in Halle, especially by those theologians who favoured the pietism then coming into vogue: he was declared to be a despiser of religion, and a teacher of error; and a formal accusation was brought against him to the government. The immediate ground of the accusation was his oration *De Philosophia Sinensium Morali*, in which he spoke with approval of the morality of Confucius, besides which the basest insinuations were brought against him, derived from his doctrine of freedom, which, it was said, encouraged social anarchy. By a cabinet order of Frederick-William I., of date 15th November 1723, W. was deposed from his office, and

WOLF.

commanded, under pain of death, to quit Halle in 24 hours, and the Prussian dominions in two days. He did so on the 23d November, and met with a favourable reception in Cassel, and was appointed to a chair in the university of Marburg. The dispute about his philosophical system now became general, and nearly the whole of Germany took part either for or against him. At the same time he received from abroad many marks of honour and advantageous proposals, which last, however, he declined. In the meantime the Prussian government had begun to regret the steps it had been led to take against him, and had appointed a commission to re-examine the matter. This resulted in his entire justification; and when Frederick II., who had a great esteem for him and had studied his system, ascended the throne (1740), W. was induced to return to Halle as Professor of the Law of Nature and Nations, and with the titles of Privy-councillor and Vice-chancellor. In 1743, he became Chancellor in the place of Ludwig, and was raised to the rank of Baron of the Empire by the Elector of Bavaria during the regency. W. died in 1754. Before his death, he saw his philosophy spread over the whole of Germany and a great part of Europe; he had, however, outlived his reputation as an academical teacher. That he did great service to philosophy, cannot be denied. If he did not enrich it by great and brilliant discoveries, he at least directed attention to systematic method; and by treating scientific subjects in the mother tongue, he did much to create that wide-spread taste for philosophical speculation which has since been characteristic of Germany. W. adopted Leibnitz's hypotheses and principles, which he endeavoured to carry out into a complete system and popularise. But although the Wolfian philosophy was a great improvement on the scholastic Aristotelianism that had previously prevailed, its dogmatism could not stand the criticism of Kant, and it is now a theory of the past. By his voluminous writings, written partly in the German language, and the immense number of his pupils, W. had a wide and beneficial influence on his age, more especially as counteracting pietism and mysticism, then rampant. He also did good service to the German language. The multitude and extent of his writings is truly marvellous, even if we look at nothing else than the mechanical labour of writing them. He treated mathematics and philosophy in a double set of works; the one in full in Latin, the other shorter as German school-books, of the most of which several editions have been published. Besides these, are a great number of treatises on single subjects in physics, mathematics, and philosophy. His systematic works on all the chief branches of philosophy alone, amount to 22 vols. in quarto.—See *Christian W.'s eigene Lebensbeschreibung* (Christian W.'s Autobiography), published by Wuttke (Leip. 1841); Ludovici, *Sammlung und Auszüge der Sämmtlichen Streitchriften wegen der Wolf'schen Philosophie, u. s. w.* (Collection and Extracts of the Controversies about the Wolfian Philosophy, &c., 2 vols. Leip. 1737); by the same author, *Ausführlicher Entwurf einer vollständigen Historie der Wolf'schen Philosophie* (3 vols. Leip. 1737).

WOLF (corresponds to Lat. *vulpes*, a fox), the name of a wild animal of the same genus with the dog, and of which it is indeed doubtful if it constitutes a distinct species; whilst, as to the different kinds of wolves found in different parts of the world, it must be deemed at present wholly uncertain whether they are to be regarded as species or varieties, although they have, provisionally, received specific names. There exists among them the same close resemblance as in the different kinds of dog,

with a similarly marked distinction of characters, which, however, it is difficult to state as specific characters are generally stated. The same difficulty, therefore, occurs in the natural history of wolves as in that of dogs, although the number of different forms is not so great. In their most important characters, and those which, as least subject to variation, are generally regarded as best marking specific distinction, they agree not only with each other, but with dogs. The opinion, that the W. is the parent of the dog, or of some of the kinds of dog, is favoured by the identity of the period of gestation, a point which seems to be pretty well established, and which, in such a question, is to be regarded as of great importance. Dogs and wolves, also, intermix, but it is not yet fully ascertained that the offspring will continue fertile among themselves. It is further observed that wild races of dogs, whether originally wild, or having become wild (*feral* races), resemble wolves in many respects, in their dull uniformity of colour, in their lengthened muzzle, lengthened limbs, lank form, and gaunt aspect, and even in the bushiness of the tail. It has been alleged, as a reason against supposing the W. and the dog to be really of the same species, that the W. is incapable of domestication and of attachment to man. This, however, is not the case. Both the Common W. of the Old World and the wolves of America have been found capable of domestication, when taken young, and instances are on record of their having displayed an attachment to their master like dogs.

The COMMON W. (*Canis lupus*) inhabits Europe and the northern parts of Asia, its range extending from the Arctic regions as far south as the northern parts of Africa and of India. It is of a yellowish or tawny-gray colour, with strong coarse hair,

Common Wolf (*Canis lupus*).

which is longest on the ears, neck, shoulders, and haunches, but particularly on the throat; the muzzle is black, the upper lip and chin white. The ears are erect and pointed, the muzzle sharp; the legs rather longer than those of the Shepherd's Dog; the tail bushy, but not curling; the eyes oblique, giving a peculiar vicious expression to the countenance. The W. is swift of foot, and hunts deer and other animals, packs of wolves associating for this purpose; it also often commits great ravages among sheep, and attacks calves, but seldom full-grown oxen. It seldom attacks man, unless hard pressed by hunger, when it becomes very dangerous. The hungry wolves which sometimes descend, in severe winters, from the forests of the Alps, Pyrenees, and other mountains, are much dreaded by the inhabitants of neighbouring regions; and terrible stories are told of travellers chased by packs of wolves in the

forest-covered plains of the east of Europe and in Spain. In general, the W. is cowardly and stealthy, approaching sheepfolds and farm-buildings by night, in search of prey, and readily scared by any demonstration of watchfulness, fleeing from dogs, and not readily exposing itself within range of shot. It defends itself, however, with great vigour, when compelled to do so. It is not easily trapped, being extremely cautious, and appearing to understand the nature and purpose of a trap almost as well as those by whom it is set. Wolves have often been known even to approach a trap so skilfully as to devour the bait without harm to themselves, getting at it from below.

Diversities appear in the wolves of different countries of Europe and Asia, but not very considerable. The French wolves are generally browner, and rather smaller, than those of Germany; the wolves of Russia are larger, and have longer hair; the wolves of the Alps are brownish-gray, and not of large size; in Italy and Turkey a tawny colour predominates. In some very northern regions, wolves become white in winter; and white wolves, probably albinos, sometimes occur in more southern regions. The Black W. is the most marked European variety. It is found in the Pyrenees and in Spain, and is very large and strong. Strings of mules are often followed by these wolves in the passes of the Pyrenees, after evening comes on, and they not unfrequently succeed, notwithstanding all the care of the muleteers, in capturing some of the animals.

Wolves are still very plentiful in some parts of Europe. An official report of the Russian government concerning the district of Livonia, for the year 1822, states that the wolves in that district of about 20,000 square miles, destroyed in that year 1841 horses, 1807 oxen, 733 calves, 15,182 sheep, 726 lambs, 2545 goats, 183 kids, 4502 swine and pigs, and 703 dogs, besides geese and fowls. The W. was formerly common in Britain, and the Anglo-Saxon name for January, *Wolf-month*, is significant of this fact. Places of refuge from wolves were erected for travellers in wild and unpeopled districts, as at Flixton in Yorkshire. King Edgar commuted the punishment of criminals on their producing a certain number of wolves' tongues. Lands in Derbyshire were held on condition of killing wolves. It is not easy to say at what date wolves ceased to exist in England; it was probably about the end of the 15th c., but they continued to commit serious ravages on flocks, in Scotland, in the end of the 16th c., and the last W. in Scotland is said to have been killed by Sir Ewen Cameron of Lochiel, in 1680. They existed in Ireland at least as late as 1710.

The American wolves are very similar to those of the Old World. They have been described as forming several distinct species, but are by some included in one, doubtfully distinguished from the Common W., and to which the name *Canis occidentalis* is given. The fur is thicker, and the form more robust than in the Common W., the muzzle is less pointed, and the profile not so straight, the legs and ears are shorter, and the tail is more bushy. The GRAY W. (*Canis occidentalis*, var. *griseo-albus*, or *C. griseus*) is abundant in the northern parts of North America, except in the long-settled districts, from which it has been expelled by man. It is the only kind found in Canada. A few still remain in the mountainous and wooded parts of New England. Packs of wolves hang around the herds of buffaloes (bisons) on the western prairies, not daring to attack strong animals, but ready to seize any sickly straggler that falls behind the rest. They hunt and run down deer. The Gray W. equals the European species in cunning, and has been known to bite off

the cord close to the trigger of a set gun, and afterwards to devour in safety the bait placed before the muzzle. It has also been known to haul up fishing-lines set in a hole of the ice, and to help itself to the fish. It is frequently taken by means of pit-falls. On the prairies, the Indians kill great numbers of wolves by enclosing them in a circle gradually reduced, but originally extending over many miles. A premium of 10 to 20 dollars a head was formerly paid, in some parts of America, for the destruction of wolves, partly by the state, and partly by the county or town, because of their ravages among sheep. The range of the Gray W. extends to the coldest northern regions, as Melville Island and Banks's Land. In the north-western states, the Gray W. gives place to the DRUNK W. (*Canis nubilus* of many naturalists); and in the south is the BLACK W. (*C. ater* or *Lycæon*); whilst on the upper parts of the Missouri, the WHITE W. appears, and the RUFOUS W. in Texas. They differ little in characters and habits from the Gray Wolf.—The PRAIRIE W. (*C. latrans*, or *Lycæus latrans*), the COYOTE of the Mexicans, is a very different animal, more resembling the jackal. It is found from Mexico northwards to the Saskatchewan, abounding on the vast plains of the Missouri. It is 36 to 40 inches long, with a tail of 16 or 18 inches; the muzzle sharp and fox-like, the ears very large and erect, four toes on each foot, and on the fore-feet a sharp claw on the inside, two inches above the ground, attached to the rudimentary thumb; the colour is usually dull yellowish gray, with black cloudings, the under parts dirty white. It hunts in packs. It is an extremely fleet quadruped, excelling every other in the countries which it inhabits, except the Prong-horn. Its voice is a kind of snapping bark. The true wolves never bark, the only sound they emit being a prolonged and diurnal howl.

South America has numerous species of *Canis*, some of which are known as Aguana wolves, and are nearly allied to the Prairie Wolf.

WOLF-DOG, a kind of dog used for hunting the wolf, formerly abundant in Norway and Sweden, but now almost exclusively found in Spain, into which it is supposed to have been introduced by the Goths. It is of the same group with the Shepherd's Dog; and is of a large size, little inferior to the mastiff, with pointed nose, erect ears, long silky hair, and a very bushy tail curled over the back. In colour it is mostly white, with large clouds of tawny colour or brown.

WOLFE, THE REV. CHARLES, the son of a county gentleman of Kildare, was born on 14th December 1791, at Dublin. The family having come to England on the death of his father, which took place whilst he was yet quite young, the boy received his chief education at Winchester, where he shewed himself an apt scholar. Being transferred, in 1809, to the university of Dublin, he succeeded in securing a scholarship, and in 1814 his degree of Bachelor of Arts. During this period, he was actively employed as a tutor: at this time it was also that he composed the greater part of the poetry which he left as his legacy to the world. In 1817, his celebrated lines on *The Burial of Sir John Moore*, suggested by reading Southey's impressive account of it in the *Edinburgh Annual Register*, were written; and soon after, they found their way into the newspapers. So generally admired were they, that even whilst the name of their author remained unknown, they had won for themselves a secure place in the memory of the British people. As a singularly felicitous and touching poetical record of a noble and pathetic incident in our

national history, they are perhaps not likely to be forgotten whilst that history is patriotically read and remembered. W., after qualifying himself to take orders, became, in 1817, curate of Ballyclog, in the county of Tyrone, from which he was shortly transferred to the larger parish of Donoughmore. His devotion to his duties was extreme, and was repaid by the warm affection of all with whom they brought him in contact. But they seem somewhat to have overtaxed the strength of a constitution at no time robust; symptoms of consumption appeared; and a visit which he made to Edinburgh in May 1821, developed it. He tried in search of health, successively, England, the south of France, and finally the sheltered Cove of Cork, in which last place he died on 21st February 1823.

His literary *Remains*, consisting of sermons chiefly and poems, were given to the world, with a Memoir, in 1825, by the Rev. John A. Russell, M.A., archdeacon of Clogher, an attached friend of the deceased. The work, though containing some poetry of real merit, never made any great impression, and is now quite forgotten. The one beautiful piece which preserves for us the name of W., was attributed by guess, whilst he lived, to more than one of the most famous writers of the day—as, notably, Campbell and Byron. Since his death, several nefarious attempts have been made to filch from him the fame he continues to derive from it.

WOLFE, JAMES, the most famous English general of his time, was born at Westerham, in Kent, on 2d January 1727. His father was a lieutenant-colonel, afterwards General Wolfe, an officer of merit and distinction, who served under Marlborough and Prince Eugene. Along with his brother Edward, who was about a year younger, James received his first education at a small school in that neighbourhood. From the first, the boy had resolved to follow his father's profession of arms; and when little more than 13 years old, he started to accompany the colonel as a volunteer in the unfortunate Cartagena expedition. An attack of illness, however, made it necessary to put him ashore at Portsmouth just before the fleet sailed. In 1742, he received his commission as ensign in the 12th, or Colonel Duroure's Regiment of Foot, with which he was soon after embarked for service in Flanders. In the year following, he took part in the famous battle of Dettingen; and it is evidence of the capacity he already began to display, that we find him, though still the merest boy, acting in the responsible capacity of adjutant of his regiment. After the battle of Fontenoy in 1745—at which W., who had now become a captain in the 4th, or Barrell's Regiment of Foot, was, notwithstanding a current tradition to that effect, certainly not present—the British troops were withdrawn from Flanders to assist in the suppression of the rebellion at home. With the army in Scotland he served in the capacity of brigademajor, and was present at the battles of Falkirk and Culloden. In 1747, he was again abroad on service. At the battle of Laufeldt, he was wounded, though not seriously; and his conduct was so distinguished, that he was publicly thanked by his commander-in-chief, the Duke of Cumberland. In the beginning of the year 1749, he was appointed major of the 20th Foot, then stationed at Stirling, whither he proceeded. In the absence of the colonel, the command of the regiment devolved upon him. In this responsible position, which was rendered much more trying by the disaffection still prevalent, young as he was, W. conducted himself with admirable tact and discretion. With little interruption, he remained in Scotland till the end of 1753, when the regiment returned to England. From the tone

of his correspondence, it is evident he was not greatly delighted with Scotland or its inhabitants. In the mismanaged expedition against Rochefort in 1757, W. was appointed to act as quarter-master-general of the force. The total failure of the operations brought disgrace to nearly all concerned; but it became sufficiently known that, had W.'s prompt and daring counsels been followed, the result would have almost certainly been different; and his reputation, already a brilliant one, rose considerably in consequence. In particular, it appears that the attention of Pitt was now first decisively drawn to him as an officer of whom, in any enterprise intrusted to him, great things might be expected. As marking approval of his conduct, the full rank of colonel was conferred on him. The high opinion thus formed of him, was signally confirmed the year following, when he was intrusted with the command of a brigade in the expedition against Cape Breton, under General Amherst. A great success was obtained in the capture of Louisbourg; that it was mainly due to W.'s skill, boldness, and activity was quite clearly understood, and he became popularly known as 'the Hero of Louisbourg.' Presently came the opportunity which was to consummate his glory, in the instant of heroic death. Pitt was now organising his grand scheme for the expulsion of the French from Canada; it was his just boast that he 'sought for merit wherever it was to be found;' and the expedition, which had for its object the capture of Quebec, the enemy's capital, he confided to the care of W., allowing him, as far as possible, a *carte blanche* for the choice of his subordinate officers. On 17th February 1759, W., advanced to the rank of major-general, and commanding an army of between 8000 and 9000 men, set sail from England. At Louisbourg, he had news of the death of his father, the state of whose health had for some time been such as to prepare him for the event. On the 26th June, W. landed his forces on the Isle of Orleans, opposite Quebec, and proceeded to concert his plans for the attack upon it. This, of which he had shortly before written as likely to be found 'a very nice operation,' proved, on a closer examination, to be one of stupendous, and, indeed, nearly hopeless difficulty. The system of defence adopted by his adversary, the skilful and wary Montcalm, was such as to offer him no point of advantage. In all his attempts, though seconded most ably by Admiral Saunders, who commanded the fleet, he found himself completely foiled. The season wore fast away during which operations could be continued; and an abortive result seemed imminent of the expedition from which so much had been hoped. But at last, at day-dawn of the 13th September, he found himself at the head of his little army, on the Heights of Abraham, above the city, where Montcalm, sorely against his will, was forced to risk decision of the struggle by battle in the open field. Resolving to stake all on a final effort, W. had, during the night, succeeded in scaling the cliffs at a point insufficiently guarded—an operation of such frightful risk and difficulty, as in war has scarcely a parallel. Of victory he had no doubt; his little force, now—exclusive of detachments necessarily left behind—reduced to something like 5000 men, was indeed opposed to near 8000 of the enemy, besides Indian auxiliaries; but of these it was well known that only a part could be depended on as trained and veteran troops. The result justified his confidence; after a short struggle, the enemy was driven from the field in complete rout; the capitulation of Quebec followed some days after; and its fall decided the fate of Canada. But W. did not live to reap the fruits of his victory; he died in its very

hour. In person he led the right; twice wounded, he refused to leave the front; a third bullet prostrated him; and he was carried, plainly dying, to the rear. He lived only long enough to know that the battle was decisively won; then rallying his last strength to give one final order, and saying: 'Now God be praised! I die in peace,' he expired. The gallant Montcalm also fell, paying, with almost his last breath, the tribute of a true soldier to the valour of the troops who had beaten him: 'Since,' said he, 'it is my misfortune to be discomfited and mortally wounded, it is a *great consolation* to me, to have been vanquished by so brave an enemy. If I could survive, I would engage to beat three times the number of such forces as mine were, with a third of British troops.'

The news of the victory was received in England with a tumult of exultation, dashed with grief for the loss of the hero to whom the nation owed it. When parliament met in November, the House of Commons addressed the king, praying that his Majesty would order a monument to be erected to the memory of the dead soldier in Westminster Abbey; where, accordingly, an *effigy* of him may be seen, with allegorical adjuncts as tasteless and absurd as usual. He was buried beside his father, in the family vault under the parish church at Greenwich.

A single military achievement, however brilliant, cannot be made ground of a claim for the successful soldier to take rank as a great captain. But that W. had the true genius for command, which needed only time and farther opportunity to win for him a fame still more splendid, it is scarcely permitted us to doubt. Through the lower regimental grades he rose rapidly by sheer force of personal merit, at a time when the service was a mere hotbed of corruption; and on attaining to higher commands, he in every instance gave evidence of the higher military qualities which proved him eminently worthy of them. He had only reached the age of 33, when in his last, and properly his one great achievement, he died, seemingly cut off in the mere opening of a brilliant career. He was of warm affections, and frank and generous nature; though his temper was somewhat eager, impulsive, and irascible, few men have ever been more generally beloved; and not many men so famous have left behind them a memory in every way so pure and spotless.

Till lately, no memoir of him in the least adequate existed; but in *The Life of Major-general James Wolfe—founded on Original Documents, and illustrated by his Correspondence*, by Robert Wright (Lond. Chapman and Hall, 1864), the want is now competently supplied.

WOLFENBÜTTEL, a very old town of Brunswick, stands in a low marshy district on both banks of the Oker, 7 miles south of Brunswick by railway. Its old fortifications have been converted into promenades. There are several churches, schools, charities, and a college. In a handsome building formed after the model of the Pantheon at Rome, is the famous library placed here in 1644, of which Lessing was sometime librarian. It consists of 200,000 vols. and 5000 MSS., or, according to some authorities, 220,000 vols., and contains some of the finest missals in Europe, an immense collection of Bibles, including Luther's Bible with autograph notes. In the same institution are preserved the great Reformer's marriage-ring, spoon, drinking-glass, and portrait by Cranach. The cultivation of vegetables is carried on to a great extent, and there are manufactures of lacquered and japanned wares, paper-hangings, leather, tobacco, and liqueurs; a trade in corn, cattle, and linen-yarn. W. has five annual fairs. Pop. (1864) 9333.

WOLFENBÜTTEL FRAGMENTS. See LESSING; REIMARUS.

WOLFFIAN BODIES, important organs in the vertebrate embryo, in which they serve only a temporary purpose, except in the lowest class (the fishes), where they remain permanently. In the development of the chick, these bodies may be seen as early as the fourth day, lying along either side of the vertebral canal, from the region of the heart downwards and backwards, and consisting of a series of caecal or blind appendages, corresponding with the so-called kidneys of fishes, which in reality are true persistent Wolffian bodies. On the fifth day, the appendages become convoluted, and the body which they collectively form increases in mass. The appendages are then seen to possess a secreting property, and the fluid which they secrete is conveyed by the duct of each side into the *allantois*, a sac which, at the same time, acts as a temporary respiratory organ, and is also used as a urinary bladder. Hence these organs may be regarded in the light of temporary kidneys.

State of the Urinary and Genital Apparatus in the early embryo of the Bird: a, Corpora Wolffiana; b, their excretory ducts; c, kidneys; d, ureter; e, e, testes.

In the chick, the true kidneys begin to form from the Wolffian bodies at the fifth or sixth day, and gradually increase in size as the temporary organs diminish; and at the end of fetal life, only a shrunken rudiment of them can be observed. In man, the process is very similar, the Wolffian bodies beginning to appear towards the end of the first month; while in the seventh week, the true kidneys first present themselves. From the beginning of the third month, the Wolffian bodies begin to decrease, the kidneys increasing in a corresponding ratio, and at the time of birth, scarcely any traces of the former can be seen. It was formerly believed that the essential parts of the generative apparatus—the testes in the male and the ovaria in the female—were also developed from these bodies; but this is not the case, as they have an independent origin in a special mass of blastema peculiar to themselves, in the immediate vicinity of the Wolffian bodies.—See Carpenter's *Principles of Human Physiology*, 6th ed., p. 810.

WOLFFIAN BOTTLES, the name given to a set of apparatus employed for the distillation of Hydrochloric Acid (q. v.). It consists of a retort, *a*, in which chloride of sodium (common salt) is submitted to the action of sulphuric acid, gradually added through the funnel *b*, and the vapour evolved passes out into the first bottle (which, in the accompanying figure, is represented as half full of water), and is absorbed by the water. This process continues till the power of absorption of the water in the first bottle ceases (or, in other words, till the water becomes saturated), when the vapour collects in the neck of the retort and in the tube *c*, till it acquires sufficient tension to force its way through the water, and enter the second bottle by the tube *d*. In turn, the water in the second bottle becomes saturated, after which the gas is forced to find its way into the third bottle through the other two by means of the connecting tube *f*. After the force of reaction in the retort has become weakened,

the evolution of the gas is quickened by the application of a flame, which requires to be gradually increased. Considerable heat being generated during absorption, it is desirable that the bottles should be immersed in cold water. The tubes, e, e, admit

Wolfian Bottles.

atmospheric air to prevent the rarefaction in the retort tending to force the contents of the bottles back into it.

WOLF-FISH (*Anarrhichas*), a genus of fishes of the family *Blenniidae* (see **BLENNY**), having no ventral fins, the pectorals very large, a single dorsal fin extending from behind the head almost to the tail-fin, a long anal fin, the tail-fin rounded; the head round, smooth, and blunt; the teeth large and strong, not attached immediately to the jaws, but to bony processes connected with them by sutures.

Wolf-fish (*Anarrhichas lupus*).

The jaws are powerful, the front teeth resemble the canine teeth of mammals, whilst the vomer and palate are furnished with teeth which have the form of rounded tubercles. One species, the **COMMON W.**, also called **CAT-FISH** and **SEA-CAT** (*A. lupus*), is found on the coasts of Britain, and is plentiful in more northern seas. It is frequent on the coasts of Scotland, particularly in the north, but is more rare on the English coasts. It is of a light gray colour, brownish on the back; the lower parts exhibiting ten or twelve dark transverse stripes. The skin is covered with much slime. It attains the length of six feet, and is a creature of formidable and even repulsive appearance: it bites savagely when caught, and fishermen therefore generally despatch it as soon as possible by knocking it on the head. It preys chiefly on molluscs and crustaceans, which its jaws easily crush. It is often very destructive to nets, being an active and powerful fish. Notwithstanding its ugliness, it is in esteem for the table, and it is often brought to the Edinburgh market. It is much used in Iceland, both fresh and salted; and a kind of shagreen, used for bags and pouches, is made of its thick skin. A very similar species, *A. vomerinus*, is found on the American coast from New York to Greenland, and is not only used fresh, but also split, salted, and smoked.

WOLFRAM is a native compound of tungstate of iron and manganese, from which the metal Tungsten (q. v.) is usually obtained.

WOLF'S-BANE. See **ACONITE**.

WOLGAST, a commercial town and seaport of Prussia, in Pomerania, stands on the Peene, about 10 miles from its entrance into the Baltic, and 33 miles south-east of Stralsund. The shallowness of the water admits only the smaller class of sea-going vessels entering the harbour. There is a public dockyard and a school of navigation; and the inhabitants, who number about 6000, are occupied in shipbuilding, seafaring, and in the manufacture of candles, soap, and tobacco. The larger ships discharge and take in cargoes at Ruden, a small island and pilot-station opposite the mouth of the Peene, known as the landing-place of Gustavus Adolphus in 1630. W. is a very old town; it was strongly fortified as early as the 12th c., and was once the residence of the Dukes of Pommern-Wolgast; it was taken and retaken five times between 1628 and 1675; the Russians plundered and burned it in 1713, and the Swedes retook it in 1715.

WOLLASTON, WILLIAM HYDE, M.D., a distinguished physicist, was the second son of the Rev. Francis Wollaston, of Chiselhurst, in Kent, and was born August 6, 1766. After the usual preliminary education, he was entered of Caius College, Cambridge, where he studied for the medical profession, and took the degree of M.D. in 1793, in which year, also, he was elected a Fellow of the Royal Society. After practising as a physician at Bury St Edmunds, he removed to London; but being beaten by Dr Pemberton in a competition for the post of physician to St George's Hospital, he determined thenceforth never to write a prescription, 'were it for his own father,' but to devote himself wholly to scientific investigation. This sudden resolution proved ultimately most beneficial, leading him rapidly to wealth and fame; for unlike many eminent investigators of nature's laws and phenomena, W. combined 'the genius of the philosopher with the skill of the artist,' and succeeded in making industrial application of several of his important discoveries. His researches were prosecuted over a wide field, but were pre-eminently fruitful in the sciences of chemistry and optics. To the facts of the former science he added the discovery of new compounds connected with the production of gouty and urinary concretions, such as phosphate of lime, ammonio-magnesian phosphate (a mixture of these two forming the 'fusible' calculus), oxalate of lime, and cystic oxide; the discovery in the ore of platinum of two new metals, palladium (1804) and rhodium (1805); and the determination (1809) of the identity of the supposed new metal tantalum with columbium. He also established the important doctrine of multiple combinations of chemical substances in a paper 'On Super-acid and Sub-acid Salts,' which was printed in the *Philosophical Transactions* for 1808; and by suggesting the construction of a synoptical scale of chemical equivalents, did much to establish in Britain the theory of definite proportions. By his ingenious discovery of a mode for making platinum malleable, he is said to have gained £30,000, and his mode of hardening steel, and some other discoveries of a practically useful nature, were also very lucrative. His contributions to optics were the celebrated 'Goniometer' (q. v.), a most valuable gift to mineralogists; an apparatus for ascertaining the refractive power of solid bodies; the 'Camera Lucida' (q. v.); the discovery of invisible rays outside the violet band of the spectrum; and an immensity of valuable and interesting observations on single and double refraction. To other sciences his contributions were also of importance, for he was the first to demonstrate the identity of

galvanism and common electricity, and explain the cause of the difference in the phenomena exhibited by each; he invented a 'cryophorus' for illustrating the theory of heat; constructed a most convenient kind of blowpipe; &c. W. was elected secretary of the Royal Society, November 30, 1806; and on November 30, 1828, he was awarded one of the Royal Medals for his discovery of the mode of making platinum malleable. He died of effusion of blood on the brain on December 22 of the same year. His most important Memoirs, 38 in number, will be found in the *Philosophical Transactions* (1800—1829).

WOLSEY, THOMAS, CARDINAL, was born in 1471 at Ipswich, in the county of Suffolk, and is reputed to have been the son of a butcher of that place. Though thus of humble origin, it is certain that by some means a good education was secured him, and, at an unusually early age, he was sent to Magdalen College, Oxford, of which he became a Fellow. It is said that while at Oxford, he was brought into somewhat intimate relations with the great Erasmus, unquestionably then in England. He afterwards acted as tutor to the sons of the Marquis of Dorset, through whose favour he became, in 1500, rector of Lymington, in Somersetshire. On one occasion, he appears to have got himself into difficulties. At a fair in the neighbourhood, it was his misfortune one day, it is said, to be found drunk and disorderly; and by a certain knight of the shire, by name Sir Amias Poulet, he was put in the stocks for the misdemeanour. That he figured in the stocks, is certain; that he did so on the score of drunkenness there is no adequate evidence. When the power to retaliate came to him, he took his revenge on Sir Amias by having him imprisoned for six years.

W., who was plainly one of the most insinuating of men, in Somersetshire became intimate with a Sir John Nafant, a man of considerable mark. Through the influence at court of this gentleman, he was appointed chaplain to Henry VII., with whom he speedily ingratiated himself. Being sent by the king on a special embassy to the continent, he acquitted himself so dexterously, that he rose still higher in favour; and in 1508, the deanery of Lincoln was conferred on him. The year after, Henry VIII. succeeded to the throne left vacant by the death of his father. Nearly from this time forward, the life of W., previously noted, indeed, as a rising man, yet of no special public importance, is in effect the history of the England of which he implicitly became the ruler. From Henry he enjoyed the most unbounded favour and confidence; and the influence which he thus exerted in the conduct of affairs was such as has seldom been exerted by a subject. The most valuable ecclesiastical preferences were showered upon him; and finally, in the same year (1515), he obtained the bishopric of Lincoln, and the archbishopric of York. The year following, the dignity of cardinal was conferred on him by the pope, who, not long after, appointed him also legate. Besides these ecclesiastical honours, he was made by the king, in 1515, his Prime Minister, and Lord High Chancellor of England. From this time, up to that of his forfeiture of the royal favour, W. was one of the most important men in Europe; and at home his power was almost without limit. The revenues derived from his various offices were of princely magnitude; and they were further enlarged by subsidies from foreign potentates, eager to conciliate his favour. He did not bear his honours meekly; in his way of life he affected a sumptuous magnificence, and a state only not royal, whilst in bearing he was arrogant and imperious. He openly aspired to be

pope; and there seemed more than once ground for supposing that this crowning object of his ambition was really within his reach. He was, however, disappointed; and it has been surmised that his resentment against Charles V., to whom he attributed his failure, determined, to a considerable extent, the foreign policy of the country.

Such a man could not fail to have many enemies, eager, as occasion might offer, to discredit him with his royal master; and an occasion at length came, of which they did not fail to take advantage. To the project on which the king had set his heart, of divorcing Queen Catharine, and marrying Anne Boleyn, W. shewed himself hostile; of the latter part of the scheme he was known to disapprove; and his negotiations with a view to securing the consent of the pope to the divorce were conducted, as it seemed to the king, in a dilatory and half-hearted manner. Henry, where his passions were interested, could little brook contumacy of this kind; his displeasure was carefully fanned, and the disgrace of W. was accomplished. In 1529, he was stripped of all his honours, and driven with ignominy from the court. Symptoms of relenting shewed themselves, however, next year in the mind of the monarch, and it seemed as if W. might again be taken into favour. The prospect, as it proved, was delusive. Being at the time in Yorkshire, the archbishopric having been restored to him, along with others of his minor preferences, he was arrested on a charge of high treason, and ordered to be conveyed to London for trial. On his journey, he was attacked with dysentery, and at the monastery of Leicester, in November 1530, he died.

The faults of W.'s character are obvious; but if his pride, ambition, and rapacity were inordinate, his luxury and ostentation somewhat unbeseeming a successor of the primitive apostles, he was not without redeeming qualities. Haughty and insolent to his enemies, and those whose claims ran counter to his own, to his dependents and inferiors he was generous, affable, and humane; and not a few of them shewed their honourable sense of this by devotion to him in his misfortunes. Of learning, he was a most liberal and enlightened patron; and the endowment of Christ Church College, Oxford, survives as a monument to attest this. He was plainly a man of large and splendid capacity; and he seems, on the whole, to have been a diligent, faithful, conscientious, and salutary counsellor and servant of the monarch who so long and entirely trusted to him.

WOLUSPA—i. e., the prophecy of Wala—is the name of an old Norse poem, preserved in the older Edda, which principally contains the description of the creation and the destruction of the world. The Wala who delivers the utterances, whose name properly signifies *prophetess*, appears in it herself as a mythical being. According to Weinhold's explanation in Haupt's *Zeitschrift* (1847), the poem, as we have it now, was produced out of older popular songs by the hand of a later author at a time when Christianity had already penetrated into the north, somewhere in the first half of the 9th century. Besides being contained in the Edda, it has been separately published by Gräter (Leip. 1818), by Ettmüller (Leip. 1830), likewise by Bergmann in the *Poèmes Islandais* (Par. 1838), and by Dietrich in the old Norse *Leesbuch* (Leip. 1843).

WOLVERHAMPTON, a municipal and parliamentary borough of Staffordshire, a flourishing centre of the manufacture of iron, iron wares, and tin-plate goods, and the most populous and wealthy town of its county, 10 miles north-west of

WOLVERINE—WOMB.

Birmingham, with which it is connected by railway. Besides Roman Catholic and other Nonconformist chapels, numbering in all 25, there are also within the municipal borough 10 churches, of which that of St Peter's is a stately edifice, with a lofty embattled and pinnacled tower. In the immediate suburbs there are (1867) 3 new churches and 4 Nonconformist chapels. Of these 13 churches and 29 chapels, 11 churches and two-thirds of the chapels have been erected since 1827. Its leading public schools are—a thriving grammar-school, founded 1714; an Orphan Asylum, instituted 1850, for orphans from all parts of the kingdom, with 100 scholars, and room for 200; and a School of Practical Art, opened 1854. Among its philanthropic institutions, a General Hospital and Dispensary, opened 1849, having 100 beds, and, like the Orphan Asylum, supported by voluntary contributions, is the chief. W. sent members to parliament first in 1832, and became a municipal borough in 1847. It has Quarter Sessions of its own, a spacious cattle-market, and a market-hall. New corporation offices and police barracks are about to be erected; a system of deep sewerage is commenced; and its abundant water supply is in the hands of the corporation. There is a recently erected bronze equestrian statue of Prince Albert standing in Queen Square. The town possesses an Exchange, where iron-masters and merchants assemble; and an Agricultural Hall, for the use of farmers and corn-dealers. W. stands upon the western edge of the extensive coal and iron-mining district of South Staffordshire, and is the metropolis of that district. On the south and east, the vicinity is covered with coal mines, iron-stone pits, blast-furnaces, forges, rolling-mills, and foundries; but on the north and west it is rural and picturesque. Its chief manufactures are tinsplate and japanned goods (14 manufactories), enamelled hollow wares, locks and keys, edge-tools, iron brazery and galvanised iron goods, gas and water tubes, cables and railway fastenings, iron-foundry goods, machinery, mills, cut nails, tips, cast hinges, electro-plate and papier-mâché goods, brass castings, and finished iron. Besides the establishments engaged in the hardware manufacture, there are several flour-mills and chemical and artificial manure works. The hardware goods manufactured at W. are remarkable for beauty of finish and genuineness of workmanship. The town enjoys unusual facilities for communication and transport. For a considerable time, it has commanded canal communication; and quite recently, it has become the focus of a number of converging lines of railway, by means of which it is placed in direct relations with the important quarters of the country. Its market-day is Wednesday, under a charter by Henry III. (1258). The borough returns two members to the House of Commons. Pop. (1851) of parliamentary borough, 119,748; (1861) 147,670. Pop. (1861) of municipal borough, 60,860; (1867) 66,000.

W., a town of considerable antiquity, was originally called Hampton, and afterwards Wulfrune's Hampton (of which its present name is a corruption), from the circumstance that Wulfrune, the sister of King Edgar, founded and endowed here (996) the church and college of which St Peter's is the modern representative.

WOLVERINE. See GLUTTON.

WOMB, THE, professionally known as the *Uterus*, is a flattened, pear-shaped organ, whose position and various parts will be best understood by a

reference to fig. 1. It consists of a body (1), a base or fundus (2), a neck or cervix (3), and a mouth or *os uteri* (4). It lies in the line of the axis of the outlet of the Pelvis (q. v.), with base directed up-

Fig. 1.—The Uterus and its appendages viewed on their anterior aspect:

1, the body of the uterus; 2, its fundus; 3, its cervix; 4, the os uteri; 5, the vagina laid open; 6, the broad ligaments of the uterus on left side; 7, a convexity of the broad ligament caused by the ovary; 8, 8, the round ligaments; 9, 9, the Fallopian tubes; 10, 10, their frimbriated extremities; 11, the right ovary; 12, the utero-ovarian ligament; 13, the Fallopio-ovarian ligament in the peritoneum of the anterior surface. The membrane is removed on the right side to shew the parts embedded in its folds.—From Wilson's *Anatomist's Vade-Mecum*.

wards and forwards, and the neck directed slightly backwards. See fig. 2. In the unimpregnated condition, which we are now considering, it is about three inches in length, two in breadth, and one in thickness, and weighs about an ounce and a half. On laying it open, or exploring its interior by the introduction of an instrument through the *os uteri*,

Fig. 2.—Section of Pelvic Viscera, with the parts in position:

A, the uterus; B, the bladder; C, the rectum (the latter two being moderately distended); *aa* is a line from the lower border of the symphysis pubis to the promontory of the sacrum; *bb*, from the same spot to the lower margin of the fourth sacral vertebra; *cc*, the axis of the uterus. When prolonged, it runs three-quarters of an inch in front of promontory of sacrum, and hits the end of the coccyx.

its cavity is found to be very narrow, and to contain a little mucus. Its walls are nearly half an inch thick, and are mainly composed of muscle-cells and fibres running irregularly in all directions except round the *os*, where they make a partial sphincter. This muscular coat, which constitutes the bulk of the organ, is covered externally with a serous coat,

derived from the peritoneum, and is lined internally by a mucous coat continuous with that of the canal called the *vagina*, by which the interior of the womb communicates with the outer surface of the body. This mucous coat abounds in small mucous follicles, and is provided with ciliated Epithelium (q. v.). The neck or *cervix* of the womb is distinguished from the body by a well-marked constriction. The mouth, or *os*, projects slightly into the *vagina* (which is shewn as laid open anteriorly in the figure). This opening is nearly round in the virgin, and transverse after parturition. It is of considerable size, and is named the *orificium uteri externum*; it leads into a narrow canal which terminates at the upper end of the *cervix* in a smaller opening, the *orificium internum*, beyond which is the shallow triangular cavity of the womb, of which it forms the lower angle, while the two upper angles, which are funnel-shaped, constitute the beginning of the Fallopian Tubes (q. v.), whose apertures are so small as only to admit the passage of a fine bristle. The blood-vessels and nerves enlarge in a very remarkable way during pregnancy, so as to adapt themselves to the increased wants of the organ, which, at the ninth month of utero-gestation, weighs from two to four pounds. The term *appendages to the uterus* is given to the Fallopian Tubes and Ovaries (q. v.), which are enclosed by the lateral folds of the peritoneum called the broad ligaments. The womb is suspended in the pelvic cavity in such a way as, by its mobility, to escape rude shocks from without or disturbance from the varying conditions of the surrounding viscera, while at the same time to allow of its vastly increasing in bulk with comparatively little discomfort when pregnancy occurs. This is effected by several duplicatures of peritoneum, containing variable quantities of fibrous and muscular tissue, and known from their form or connection as the *broad*, the *round*, the *utero-sacral*, and the *utero-vesical* ligaments.

The uterus is an organ peculiar to the Mammalia, and in comparatively few of them (excepting the Apes and Cheiroptera) is it of the simple oval or triangular form which we have described. It is *two-horned* in the Ruminantia, Pachydermata, Solipedia, and Cetacea; and it is said to be *divided* where it has only a very short body, as in most of the Carnivora and Edentata, and some Rodentia, which speedily divides both externally and internally, and is continuous with the oviducts or Fallopian tubes. The uterus is actually *double* in some of the Edentata, and in most of the Rodentia, including the mouse and hare; in which each Fallopian tube passes into an intestiniform uterus, which has two completely distinct openings lying near to each other within the *vagina*. In the Marsupialia and Monotremata, the modifications of this organ are still more singular.

It is impossible to do more than name the chief offices or functions of the womb. They may be divided into those which relate to (1) Menstruation (q. v.), (2) Insemination, (3) Gestation, and (4) Parturition.—For a complete account of the anatomy, physiology, and pathology of the uterus and its appendages, we must refer to a masterly article by Dr Arthur Farre on that subject in the last volume of the *Cyclopaedia of Anatomy and Physiology*.

WOMB, DISEASES AND DERANGEMENT OF THE. In this article we shall not include the ailments of the pregnant or of the puerperal state, some of which, as *Phlegmasia Dolens* and *Puerperal Fever*, have been noticed in special articles. Many of the diseases, however, which we shall have occasion to notice may be traced to pregnancy, miscarriage, or severe delivery, that had occurred months previously. A

common result of inflammation that often succeeds miscarriage or a bad delivery is to check the process of involution by which the womb ought to be restored in a few weeks to the size and condition in which it existed previous to the occurrence of pregnancy. For a lucid description of the processes which act on the enlarged womb to restore it to its original state, we must refer to Dr West *On Diseases of Women*, 2d ed. p. 90. How inflammation acts in interrupting these processes, is not easily explained; but after it has passed away, its effects may remain in the enlarged size and altered structure of the womb, changes which render it likely to suffer from the alternation of activity and repose to which the female generative system is liable. In this condition, the enlarged and heavy uterus is very likely to become prolapsed, or to become a seat of permanent congestion or chronic inflammation; and excessive menstruation and a feeling of weight in the pelvis are almost always present. Besides this form of enlargement, there is a far less common form in which the enlargement of the womb takes place independently of previous pregnancy, and is the result of true hypertrophy. The symptoms are, according to West, 'a sense of weight in the pelvis, pain usually of a burning character, hæmorrhages having gradually come on, and forced themselves by their slowly increasing severity on the patient's notice.' The treatment is much the same in both these forms of enlargement—viz., the recumbent position on a hair or spring mattress, attention to the bowels, and local leeching every fortnight, to be continued for several months, together with the careful use of iron associated with small doses of iodide of potassium. Temporary separation from the husband's bed should also be insisted on. There is also a form of hypertrophy which is confined to the neck of the womb, which occasions great discomfort to the patient, and acts as a mechanical impediment to sexual union. In these cases, no relief can be afforded except by a surgical operation, which is described in West, *op. cit.*, p. 77.

From these results of 'simple errors of nutrition,' leading to increased growth of the organ, we pass on to the debatable and much-trodden ground of *inflammation of the womb*. *Acute inflammation* of the unimpregnated womb may arise from unaccustomed and excessive sexual intercourse, sudden suppression of the menstrual discharge, the extension of gonorrhœal inflammation, &c.; but, as it is comparatively rare, and seldom dangerous to life, we shall at once pass on to an affection which by most practitioners is regarded as one of the commonest to which woman is liable—viz., *chronic inflammation and ulceration of the neck of the womb*. It is not forty years ago since a French physician, M. Recamier, invented an instrument—the speculum—for the application of local remedies to the neck of the womb in cancer; but the light which this instrument threw upon uterine conditions generally, led, amongst other results, to the conclusion, that leucorrhœal discharges (popularly known as *the whites*) were often derived from, and associated with, various morbid appearances of the mouth of the womb, and could often be removed by remedies directed to that part. Almost ever since the speculum began to get into general use, a large number of old-fashioned practitioners raised up a cry against its employment, on the grounds of its indelicacy, its inutilty, &c., and denied the very existence of various morbid conditions, which the employers of the instrument declared they saw with its use. Hence two parties have arisen—one who believe in the speculum and its revelations; and another who reject the recent modes of investigating uterine diseases, who take small

account of the new facts regarding local disease which have been revealed, and who regard uterine ailments as resulting from constitutional derangements, and who therefore trust mainly to general treatment. Now, although the view that the local disease is everything, may not be universally true, the opposite view is certainly untenable; and Dr West and other writers on this subject have pointed out that there are reasons why the womb should more frequently than perhaps any other organ be the seat of certain forms of local ailment, and should consequently require the frequent employment of local treatment. It would be out of place in these pages to describe the characters of the ulcerations or abrasions of the mouth of the womb, which are so frequently revealed by the speculum, or to enter into any detail regarding the high pathological importance attached by some writers to them. The conclusion which Dr West draws from a prolonged investigation of this subject is, that 'the condition of so-called ulceration or abrasion of the os uteri is far from infrequent, even in cases where no uterine symptoms were complained of during life; but that it is usually unassociated with other important affections of the uterus, such as may be supposed to be the effects of inflammatory action; and, further, that such affections do not seem to be readily excited by causes acting on the neck of the womb, either when displaced, or when the organ is in its natural position.'—*Op. cit.* p. 120. Since uterine pain, disordered menstruation, and leucorrhœal discharges—the symptoms usually associated with ulceration of the mouth of the womb—are met with by impartial observers almost as frequently *without* as *with* ulceration, it may be fairly inferred that this ulceration is neither a general cause of uterine disease, nor a safe index of its progress; and although the local application of caustic to the os uteri is doubtless often successful in restoring the patient to health, it must not be considered as a general rule that the attempt, by local remedies, to remove this condition is the one and all-important point in the treatment of uterine disease. There is no doubt that, in the great majority of these cases (excepting a few of the more severe ones), temporary separation from the husband's bed, the recumbent position (which facilitates the return of blood from the womb and adjacent parts), due attention to the diet and state of the digestive organs, and the use of injections of nitrate of silver, which may be applied by the patient, are sufficient in a few weeks to effect a cure. Chronic uterine inflammation of a more general nature (as of the interior, or body of the womb), with very similar symptoms, is by no means rare. If the disease is met with in the acute form, leeches should be applied to the womb itself; in the chronic form, which is generally observed, the pain in the back is best relieved by a croton-oil liniment, composed, according to Dr West's directions, of one part of croton oil to ten of the camphor liniment (of the London Pharmacopœia), which should be applied (without rubbing it in) with a sponge twice a day on the back, at the seat of pain. Belladonna plaster or liniment also gives temporary relief. The irritability of the bladder, which is a common symptom, is usually associated with abundant phosphatic deposits in the urine, and is best relieved by a combination of ten or fifteen minims of dilute hydrochloric acid, half a drachm of tincture of henbane, and two ounces or more of decoction of Pareira-Brava (see *CISSAMPPELOS*), three times a day; and the tepid hip-bath may be used with benefit. The same general rules as to rest, diet, &c. which have been already given, must be attended to. Under the best management, a tendency to

relapse is liable to occur at each monthly period, and after several such relapses, the womb is found (on surgical examination) to be enlarged and hardened, and less movable than natural. This condition is best removed by the careful and prolonged use of bichloride of mercury in small doses, which, as it is a deadly poison, must only be taken by professional advice; but the pain in the groin which usually accompanies this change, may be relieved or removed by the application of a small blister. The profuse discharge—both menstrual and leucorrhœal—is best relieved by chalybeate preparations, of which the following is a useful and favourite compound: Take of sulphate of iron, 6 grains; sulphate of magnesia (Epsom salts), 3 drachms; dilute sulphuric acid, half a drachm; syrup of orange peel, half an ounce; caraway water, sufficient to make a mixture of 6 ounces, of which 1 ounce may be taken thrice daily, after meals; or if there be much hæmorrhage, a mixture of alum and sulphate of iron (4 grains of the former to 1 of the latter, dissolved in a small tumbler of water) may be taken three times a day. A hip-bath, containing half a pound of alum to every gallon of water, is often very useful as an astringent. It should be taken in the morning before dressing, and the patient should remain in it at least a quarter of an hour. For the first time or two, the water may have the chill just taken off. The same importance is not at present attached to vaginal injections as when it was believed that the vagina (and not the womb) was the main source of leucorrhœal discharge. In a case of leucorrhœal discharge of long standing, an excellent astringent injection may be formed by dissolving two drachms of tannin and half an ounce of alum in a quart of water. Special forms of female or vaginal syringes are sold for this purpose. Of the application of caustics to the mouth of the womb, we say nothing, as that is a matter which must be left solely to the medical attendant.

From these remarks on the diseases of this important organ, we pass on to a very brief notice of its occasional *misplacements*. The singular mobility of the womb (without which pregnancy would be almost an impossibility) exposes, it to the risk of displacement to such a degree as often to give rise to great personal discomfort. As all the causes which tend to produce displacement (such as increased weight of the organ during pregnancy, pressure of the superincumbent viscera, &c.) act in a downward direction, the obvious tendency of the womb is to be thrown downwards, or to suffer *Prolapsus* (q. v.), an affection which, in its extreme degree, when the organ is more or less protruded externally, is termed *Procidentia*. Causes sometimes come into play which incline the upper part of the uterus either backward or forward, giving rise to *retroversion* and *anteversion*, instead of mere prolapse. Prolapsus is sufficiently considered in the article bearing that title; and for a description of the symptoms and treatment of the two last-named misplacements, we must refer our readers to the standard works on the Diseases of Women.

The tendency of the womb to hypertrophy has been noticed at the beginning of this article; its individual tissues have a similar tendency to overgrowth, shewing itself at particular parts, and thus giving rise to tumours or outgrowths, which are more common in this than in any other organ. Under this head may be mentioned several varieties of *Polyppus*, which differ essentially in structure, but all of which are invested by the mucous membrane which lines the uterus, and are liable to be the source of hæmorrhage. Their removal by surgical means is generally a matter of no difficulty. Much more important than these is the *Fibrous Tumour*,

which is frequent in its occurrence, serious in its effects, and very slightly amenable to treatment. These tumours are of a spherical form and firm texture, resembling that of the womb itself, and usually occur in groups; several being frequently present, while one or two are considerably larger than the others. The symptoms to which they give rise vary extremely according as the chief tumour lies on the outer part of the womb, and grows into the abdominal cavity, or is developed within the walls of the womb, or projects into the interior. They may be of almost any size, cases being on record in which they weighed from 70 to 80 lbs. In regard to the symptoms of this affection, it must be premised that sometimes these tumours exist without exciting any disturbance, and that growths on the outer surface give rise to comparatively unimportant derangements, compared with those which are imbedded in the walls, or occupy the cavity of the womb. It will be readily understood that women who have passed the change of life (as it is popularly called) suffer less from these tumours than younger women. The diagnosis of fibrous tumour is effected partly by manual and instrumental examination (into which we shall not enter), and partly by the symptoms—such as (1) hæmorrhage occurring in about 50 per cent. of cases independently of their nature; (2) disturbance of the menstrual discharge in 62 per cent. of cases, it most commonly being excessive, and often painful; (3) pain, usually constant, and occasionally only at the menstrual period, described by some patients as a burning sensation, by others as a sense of bearing down, and by a few as occurring in paroxysms of intense agony; (4) dysuria—pain in voiding urine, or difficulty in discharging it, or frequent desire to pass it. It is usually hæmorrhage, or inability to void the urine, that first directs the attention of the patient to her malady. Its tendency to excite abortion often leads the physician to suspect its presence. Although, as we previously mentioned, this is an affection little amenable to treatment, a woman with these symptoms should at once consult a physician (if possible, the physician-accoucheur to a large hospital), who, by his advice as to the general management of the case, especially during the menstrual period, may do much to palliate her sufferings. Iodine, bromine (and certain mineral waters containing these elements), and mercury have been vaunted as specifics, but nothing positive can be said regarding their successful action; and certain surgical operations have been recommended, which are accompanied with so much danger to the patient that it is needless to refer to them. But although the action of medicines on these growths is avowedly uncertain, nature in this as in many other cases not unfrequently strives towards a more or less complete cure. For example, if the tumour is pediculated, and lies in the uterine cavity, the pedicle may finally give way, and the tumour may be expelled; or certain changes may take place in the interior of a tumour, leading either to its disintegration and elimination, or to its conversion into a chalky mass, which, though not eliminated, induces no local disturbances. These spontaneous cures are by no means rare, although we can hardly lead the patient to expect them in any special case.

We shall conclude with a few words on a disease which is the most painful and hopeless of all the disorders to which humanity is liable—*cancer of the womb*. It is a disease whose leading features are thus graphically—we may almost say, painfully—described by Dr West: 'Pain, often exceeding in intensity all that can be imagined as most intolerable, attended by accidents which render the sufferer most loathsome to herself and to those whom

strong affection still gathers round her bed; the general health broken down by the action of the same poison as produces the local suffering, and all tending surely, swiftly, to a fatal issue, which skill cannot avert, from which it can scarcely take away its bitterest anguish.' The three most constant symptoms are pain, and hæmorrhage, and discharge. From an examination of 132 cases by the above-named physician, the first symptom was found to have been,

| | |
|-------------------------------------|--|
| In 58 instances, or 43·9 per cent., | hæmorrhage without pain. |
| " 26 " | 19·6 " pain of various kinds. |
| " 18 " | 13·6 " hæmorrhage with pain. |
| " 18 " | 13·6 " leucorrhœa or other discharge without pain. |
| " 12 " | 10·3 " pain and discharge sometimes offensive. |

It is unnecessary to enter into further details regarding the symptoms of this disease, as cases of this nature must always be under medical superintendence, and for the same reason we need only say regarding the treatment, that it is divisible into the *palliative* and the *curative*, the former being directed towards the three great symptoms, and the general symptoms of the cancerous cachexia (or constitution), while in the latter are included the operation of extirpating the whole womb, or removing the neck of the womb by ligature or excision. It is difficult to speak with accuracy regarding the frequency of this disease. An approximate estimate may be formed from the fact that, in 1851, the mortality from cancer in England amounted to 1754 males and 4072 females; the excess in the latter case, amounting to 2318, must be due to cancer of the breast or womb; and according to Tanchou, a French pathologist, cancer of the womb is more frequent than that of the female breast in the rate of 26 to 10. Hence the yearly deaths from uterine cancer in England amount to about 1674. The last-named writer calculated, from ten years' observation of the French records of mortality, that this disease causes 16 per 1000 of all female deaths. The disease is very rare before the 25th year, and by far the most common period of its appearance is between the ages of 40 and 50 years. Its average duration is 16 or 17 months, but it may prove fatal in 3 or 4 months. On the subject of cancer of the womb, *Walsh On Cancer* may be consulted; and for farther information on the subject of this article generally, the reader is referred to the standard works of Churchill, Lever, Simpson, West, &c.

WOMBAT (Phascolumys), a genus of marsupial quadrupeds, constituting a distinct family, *Phascolumyidae*, and of which only one species is known, *Phascolumys Wombat*, a native of Australia, abounding chiefly in mountainous districts of New South Wales, Victoria, South Australia, and Van Diemen's Land, and in the islands of Bass's Strait. In many of its characters, it resembles the *Rodentia*. The incisors are two in each jaw, long, and chisel-like; they are hollow at the base, and continue to grow as they are worn away; there are no canine teeth; and the molars are five on each side in both jaws. There is a wide gap between the incisors and the molars. The W. is an animal of clumsy form, having stout limbs and a blunt muzzle. It is 2 or 3 feet long, plump, with a thick coat of long, grayish brown, coarse, woolly hair; the head large, flat, broad, with small eyes and ears, the upper lip cleft; the feet five-toed, the claws long, except those of the inner toes of the hind feet; the tail very short. It is plantigrade, and the soles of the feet are broad and naked. It is nocturnal in its habits, slow in its motions; feeds on vegetable substances, and digs up roots with its claws; it makes its abode in holes among rocks, or in burrows dug by itself.

It produces three or four young at a birth. It is a creature of little intelligence, but gentle, and easily domesticated to a certain extent, not seeming to care much for any change of circumstances, so long

Wombat (*Phascolomys Wombat*).

as its wants are supplied. It shows considerable snapshiness, however, if provoked. Its flesh is preferred to that of any other quadruped of Australia. It is generally fat, and the flavour is somewhat like that of pork. Wombats have frequently been brought alive to Britain.—The remains of a fossil species have been found in the caves at Wellington Valley, in Australia.

WOOD, ANTHONY, of some note as an antiquary, was born at Oxford in the year 1632. His school education he received chiefly in the place of his birth, and in 1647, he was entered at Merton College as a gentleman commoner. In 1652, he took his degree as Bachelor, and in 1655, became Master of Arts. Deriving from his father an independence, he seems at first to have aimed at being a sort of Jack-of-all-trades, as not bound in penalties of hunger to follow out any particular one. He practised the fiddle assiduously, and is said to have attained considerable skill. Painting was also one of his innocent hobbies, but none of his pictures have been preserved to enable us to test his proficiency. In addition to these accomplishments, it was his whim to concern himself with heraldry and other antiquarian pursuits. He laboured much in the libraries, and presently came to be noted for his curious turn that way. In 1656, he came upon Dugdale's *Antiquities of Warwickshire*, shortly before published, the perusal of which greatly delighted him, and awoke in him the fire of emulation. He now worked still more assiduously; and went about among the tombs, copying old inscriptions. As the fruit of these learned labours, he gave to the world, in 1669, his *History and Antiquities of Oxford*. For the copyright of this work W. received £100 from the university; and Dr Fell, Dean of Christchurch, thought so highly of it that he employed one Peers, a student, to execute a Latin translation of it. The *Historia et Antiquitates Universitatis Oxoniensis* was published at Oxford in 1674.

Subsequently, in 1691, as result of his further investigations, W. published his *Athenæ Oxonienses*, containing a full and particular account of all the authors, bishops, &c., who had adorned that seat of learning from 1500 to 1690. In this work, he attacked the character of the great Lord Clarendon, deceased; a misdemeanour for which he was prosecuted at the court of the university, and expelled. He did not long survive this disgrace, dying 29th November 1695. His books, and a selection of his manu-

scripts, he left to the university of which he had ceased to be a member, and they are preserved in the Ashmolean Museum. His life may be found at large in the edition of his *Athenæ Oxonienses* issued by Dr Bliss in 1848.

WOOD AND WOODY FIBRE. The hard and compact or tough and fibrous parts of plants are composed chiefly of a peculiar kind of Vascular Tissue (q. v.), which, when compact, is *wood*. It exists chiefly in the stems, frequently in the roots, and also in the inner bark of exogenous plants, which yields many of the most valuable fibres used in the arts, and in the midrib and veins of leaves, some very useful fibres being obtained from the leaves of endogens. See **FIBRE**. Annual plants contain little or no woody fibre, being composed chiefly of Cellular Tissue (q. v.), which also forms great part of many herbaceous perennials, and of all plants in a very young state. Woody fibre consists of elongated cells tapering to both extremities, lying close together, and overlapping one another, sometimes much elongated into tubes. Wood is entirely made up of cells of this kind, permeated in exogenous plants by medullary rays. The cells of woody fibre have their walls thickened by successive layers of cellulose and lignine, deposited in their interior, so that they acquire strength. In the inner bark of exogens, woody fibre is mixed with laticiferous vessels (see **LATEX**) and cellular tissue.

Woody fibre has generally no definite markings on the walls of its cells; but these sometimes appear as simple discs, or as discs with smaller circles in the centre. These discs are formed by concavities on the outside of the walls of contiguous cells, closely applied to each other, so as to form lenticular cavities between them, as Mr Quekett proved in fossil pine-wood, in which he separated lenticular masses of solid matter from between the discs. When the smaller circle appears in the centre of the discs, the woody tissue is described as *Punctated*. This is especially the case in *Coniferæ*, but is not absolutely distinctive of them, the same character appearing also in some other plants, as in Winter's Bark. The small circle in the centre of the disc is formed by the mouth of a canal, often funnel-shaped. These canals or pores, connecting one cell with another, are supposed to give to the wood of the *Coniferæ* its peculiar fitness for making musical instruments.

Woody fibre is not properly formed unless the leaves of plants are well exposed to the light. There is no doubt that the Cambium (q. v.) performs an important part in the formation of wood. There has been much difference of opinion among vegetable physiologists, however, as to the mode of its formation. Two principal theories have long had and still have their advocates—the *Horizontal* and *Vertical* theories. According to the former—supported by Duhamel, Decandolle, Schleiden, Mirbel, Naudin, Henfrey, &c.—the wood of trees is formed by horizontal extension from the stem or from the bark, or from both, for there is much diversity of opinion as to these particulars. According to the latter—supported by Knight, Petit-Thouars, Gaudichaud, Lindley, &c.—the wood is developed in a vertical direction from the leaves, every bud being, as the elder Darwin long ago maintained, an embryo plant sending leaves upwards and roots downwards.

Wood is not only valuable as Timber (q. v.), but for fuel, being the chief fuel used in many parts of the world. To woody fibre we are indebted also for great part of our cordage and textile fabrics, including the very finest of them, as muslin and lace. Reduced to pulp, it is used for the manufacture of paper.

A kind of factitious or artificial wood, used for

making ornamental articles, has recently been invented in France. It is called *Bois duré*. It is formed of sawdust, heated to a high temperature, and subjected to very great pressure. Its compactness and hardness exceed those of wood itself. Another kind is made by mixing blood with sawdust, and compressing. Some kinds of costly wood are also imitated by mixing their sawdust with glue, and casting the mixture into the desired shape in moulds.

WOODBINE. See HONEYSUCKLE.

WOODBRIDGE, a market-town and river-port of Suffolk, on the right bank of the Deben, which here expands into an estuary, 11 miles from the sea, and 8 miles east-north-east of Ipswich. Vessels of 120 tons can reach the town. There are a custom-house, a bonding warehouse, and docks in which shipbuilding is carried on. The church is a striking edifice of black flint and freestone, with a magnificent tower. There is also a richly endowed charity which supports an excellent and well-conducted grammar-school, commodious and extensive almshouses, a public dispensary and library. Corn, flour, and malt are exported; coals imported. In 1865, 699 vessels, of 37,720 tons, entered and cleared the port. W. is a station on the Great Eastern Railway. Pop. (1861) 4513.

WOOD-CARVING is probably the oldest branch of art. Apparently, the first weapon was a club, and the first attempt at decoration was some scratching or carving on it. Amongst the Egyptians, Greeks, and Romans it was much practised. As a branch of Christian art it was one of the earliest, and attained a high development in the 15th century. It greatly declined during the last century, but has again revived, and promises to attain great importance. The wood-carvers of Great Britain have shewn great capabilities, but hitherto have lavished too much care upon fineness of finish rather than on the artistic excellence of their designs.

WOOD-CHARCOAL is the most important, although not the purest, kind of charcoal. Wood consists of carbon, hydrogen, and oxygen, the last two being in the proportion to form water. When heated in the open air, it burns completely away, with the exception of a small white ash; but if the supply of air be limited, only the more volatile matters burn away, and most of the carbon remains. This is the principle of the process of charcoal-burning in countries where wood is abundant, as, for example, in the Harz Mountains. 'A number of billets of wood are built up vertically in two or three rows into a large conical heap, which is covered over with turf or moistened charcoal-ash, holes being left at the bottom for the air to get in. A hollow space is also left in the middle of the heap, to serve as a flue for the gaseous matters which are evolved. The heap is set on fire by throwing burning pieces of wood into the central opening, near the top of which, however, a kind of grate, made of billets of wood, is placed, to prevent the burning fuel from falling at once to the bottom. The combustion then proceeds gradually from the top to the bottom, and from the centre to the outside of the heap; and as the central portions burn away, fresh wood is continually thrown in at the top, so as to keep the heap quite full. The appearance of the smoke shews how the combustion is proceeding: when it is going on properly, the smoke is thick and white; if it becomes thin, and especially if a blue flame appears, it is a sign that the wood is burning away too fast, and the combustion must then be checked, by partially stopping up the holes at the bottom, or by heaping fresh ashes on the top and sides, and pressing them down well, so as to diminish

the draught. As soon as the combustion is completed, the heap is completely covered with turf or ashes, and left to cool for two or three days. It is then taken to pieces, and the portions still hot are cooled by throwing water or sand upon them. 100 parts of wood yield on the average from 61 to 65 parts by measure, or 24 parts by weight of charcoal.'—Watts's *Dictionary of Chemistry*, vol. i. p. 759. The charcoal thus prepared is the best suited for fuel. In England, a large quantity of charcoal is obtained in the dry distillation of wood in cast-iron cylinders, for the preparation of crude acetic acid. The charcoal thus prepared is preferable for making gunpowder, but is inferior for other purposes. A peculiar kind of charcoal of a reddish-brown colour, and hence termed *charbon roux*, is prepared in France for the manufacture of the gunpowder used for sporting purposes, by subjecting wood in iron cylinders to the action of superheated steam under a pressure of two atmospheres. Powder made with this charcoal absorbs moisture more rapidly than ordinary gunpowder.

The general properties of wood-charcoal are, that it is black and brittle, and retains the form of the wood from which it was derived; it is insoluble in water, infusible and non-volatile in the most intense heat; its power of condensing gases is noticed in the article on that subject; and from its power of destroying bad smells, it has been regarded as possessing considerable antiseptic properties. It is frequently stated that charcoal is a bad conductor of heat, but a good conductor of electricity: these properties depend upon the nature of the charcoal, the lighter wood, such as willow, yielding a porous charcoal, with little power of conducting heat or electricity; while boxwood yields a very compact charcoal, which is a good conductor of heat and electricity, and is admirably adapted for the exhibition of the electric light. Charcoal never consists entirely of pure carbon, the degree of purity varying directly with the temperature; thus, charcoal charred at 480° contains 65 per cent. of carbon, while that charred at 750° contains 80, and that charred at 2730° contains 96; but the loss of charcoal occasioned by these high temperatures is very great, the three percentages of charcoal corresponding to these temperatures being 50, 20, and 15.

The uses of wood-charcoal are numerous and extensive. It is very largely employed as a fuel, taking the same place in many countries that coal occupies here. From its being proof against all ordinary chemical agencies, 'a superficial charring is frequently resorted to, with the view to protect wood from decay, as in the case of piles which are driven into mud or into the beds of rivers to serve as foundations. For the same reason, it is a common practice to char the interior of tubs and casks destined to hold liquids.'—Miller's *Inorganic Chemistry*, 3d ed., p. 77. In a finely-divided state, it is commonly regarded, as has been already stated, as an antiseptic; and there is no doubt that the offensive effluvia from animal matter in an advanced stage of putrefaction disappear when the putrefying substance is covered with a layer of charcoal; but in reality the decay goes on, without the emission of any odour, till at length the whole of the carbon is dissipated as carbonic acid gas, and the hydrogen as water, while the nitrogen remains as nitric acid. For these explanations, we are indebted to Dr Stenhouse, who has shewn that the action consists in a rapid process of oxidation, dependent upon the power which finely-divided charcoal possesses of condensing oxygen. In a finely-divided state, charcoal not only condenses gases to a marvellous extent, but has the power of absorbing colouring matters, bitter principles, &c.; and hence it is of extensive use in

the laboratory. From the rapidity of its absorbing action, Stenhouse has proposed to use a respirator filled with charcoal to protect the mouth and nostrils in an infected atmosphere; and the employment of trays of powdered wood-charcoal in dissecting-rooms, in the wards of hospitals, and in situations where putrescent animal matter is present, is found to exert a most beneficial influence in sweetening the atmosphere, by absorbing and decomposing the offensive gases. These properties render charcoal a valuable material in the construction of filters, not only for decolorising purposes, but likewise for assisting in purifying water for domestic use. It is now also employed most successfully to prevent the escape of noxious vapours at the ventilating openings of the sewers, as it allows the free passage of air, but condenses the offensive effluvia in its pores, where they are destroyed by a process of oxidation. —Miller, *op. cit.*, p. 78. Besides its employment in the manufacture of gunpowder, it has many applications in the arts. In Medicine, it is at present chiefly used to destroy fetor; for which purpose it is applied in the form of powder or poultice to gangrenous sores, phagedenic ulcers, &c.; it is also largely employed in tooth-powders, as by its mechanical action it removes incrustations, while by its chemical action it destroys fetor of the breath. In indigestion, accompanied by much flatulence, it may be given in doses of two or three tea-spoonfuls suspended in water, or may be administered in the form of charcoal-biscuits. Very finely divided poplar charcoal is regarded as the best for medicinal uses.

WOODCHAT (*Lanius rutilus*), a bird which, notwithstanding its name, is not a species of Chat, but of Shrike (q. v.). Its whole length is about seven inches and a half. The upper parts are mostly black, the under parts white; but there is a white spot on the wing when closed, and other small portions of the wing-feathers are white, as well as the outer tail-feathers, and there is a narrow streak of white above the base of the bill on each side; the crown of the head and nape of the neck are rich chestnut red. The W. is a rare bird in Britain, but is abundant in the southern parts of Europe. It may be regarded as an African bird, being found from the Mediterranean to the Cape of Good Hope. In Europe, it appears only as a summer visitant, but in Africa it occurs at all seasons of the year.

WOODCHUCK (*Arctomys monax*), a species of Marmot (q. v.), inhabiting North America, from

Woodchuck (*Arctomys monax*).

Hudson's Bay to South Carolina. It is from fifteen to eighteen inches long, blackish or grizzled above, chestnut red below; the form thick, the head broad

and flat, with almost no apparent neck, the legs short and thick, the feet large, the tail bushy. The hair is rather soft, the whiskers long and stout. This animal digs deep holes in fields, on the sides of hills, or under rocks in woods; its burrow slants upwards, so that water may not enter, and within are several compartments. It passes the winter in the burrow, in a lethargic state. The food of the W. is vegetable, and it is particularly destructive to crops of red clover. It is easily tamed, and may be fed on bread, milk, and vegetables. It fights successfully with a dog of equal size. The name of Ground Hog is sometimes popularly given to it. Its flesh is sometimes eaten, but is rank.

WOODCOCK, the popular name of certain birds commonly regarded as of the same genus with the Snipes (q. v.), but of more bulky form than the true snipes, and having shorter and stronger legs. The COMMON W. (*Scolopax rusticola*), well known as a

Woodcock (*Scolopax rusticola*).

game-bird in Britain, and highly esteemed as a delicacy for the table, is found also in all parts of Europe and the north of Asia. It is one of the birds of Japan. It is only a winter visitant of most parts of Britain, very rarely breeding in England, but it more frequently breeds in the northern parts of Scotland. Its summer haunts are chiefly the pine-forests of the northern parts of Europe and Asia; but in summer it inhabits higher and drier ground than in winter, when it is chiefly to be found in moist woods and swamps, seeking for worms, snails, and slugs as food, boring with its long bill in the soft ground. The quantity of food which it devours is very great; a single W. has been known to consume in a night more earth-worms than half-filled a garden-pot of moderate size. The W. is about thirteen inches in length; the upper parts varied with ruddy, yellowish, and ash colour, finely intermingled, and marked by large black spots; the lower parts yellowish red, with brown zigzag lines; the quills striped with red and black on the outer edge; the tail-feathers tipped with gray above and white below. The female is rather stouter and larger than the male, and sometimes attains a weight of fourteen or fifteen ounces. A W. of twenty-seven ounces is on record. The W. makes its nest in warm dry situations, on the ground, of dead leaves loosely laid together. It lays only three or four eggs of a pale yellowish or reddish brown colour. As woodcocks usually breed in very dry situations in the recesses of thick woods, the young ones would be left to starve but for the peculiar adaptation which enables the parent to transport them to moist feeding-grounds. It was long believed that the female W. used only her feet for carrying her young from place to place; but Mr Charles St John, in his *Natural History and Sport in Moray*, says, that from close observation he found 'the old woodcock carries her young, even when

larger than a snipe, not in her claws, which seem quite incapable of holding up any weight, but by clasping the little bird tightly between her thighs, and so holding it tight towards her own body.' The W. feeds chiefly by night. Great numbers sometimes appear in some parts of Britain, in their migrations. Besides falling to the gun of the sportsman, they are sometimes caught by nets placed in the tracks or open glades in woods, by

Woodcock Trap:

The upper portion of the fig. shews the separate parts; the lower portion their arrangement when set. The part C (being only supported in its position by the pressure of B) is displaced by the weight of the bird; this relieves the spring A, and the prisoner is caught by the legs in the running noose F.

(From St John's *Natural History and Sport in Moray.*)

which they proceed from their retreats to their feeding-grounds, and by nooses or springes set about the places which they frequent.—The AMERICAN W. (*Scolopax* or *Philohela minor*) is a smaller bird than the W. of Europe, being only about eleven inches long; very similar in plumage and habits. Three transverse black bands mark the hinder part of the head. It is found in all parts of North America, and is greatly esteemed for the table.

WOOD-ENGRAVING, or XYLOGRAPHY, the art of engraving designs on wood, differs from copper and steel plate engraving by having the parts intended to print on the paper, in *relief*. While *plates* are printed from the engraved lines by a laborious and necessarily slow process (see ENGRAVING), wood-engravings, having the object to be represented on the surface, in the manner of a type, may be printed along with the matter it is intended to illustrate in the ordinary printing-machine. This, of course, is an important point in the illustration of books, on the grounds of cheapness and expedition. Another advantage wood-engravings possess is, that they can be multiplied to any extent by means of the Stereotype (q. v.) and Electrotype (q. v.) processes.

The invention of wood-engraving, like that of gunpowder, has been claimed for the Chinese, whose books have certainly been printed from engraved wood-blocks for ages. It has indeed been asserted that the art of cutting figures in relief, and printing impressions of them on paper, was known and practised by that nation as early as the reign of the renowned Emperor Wu-Wang (1120 B.C.). There is no doubt that wood-stamps were used by the ancient Egyptians and Romans for stamping bricks and other articles of clay; and that wood and metal stamps of monograms, &c., were used in various European countries, for attesting deeds and other documents, at a very early period, when the

ability to write was an extraordinary accomplishment even for princes. It is not, however, until the beginning of the 15th c. that we find any evidence of the existence of wood-engraving, as we now understand it. It appears to have been used in Germany at that time for printing playing-cards and figures of saints. The earliest print of which any certain information can be obtained is in the collection of Earl Spencer. It was discovered in one of the most ancient convents of

Fig. 1.

Germany—the Chartreuse of Buxheim, near Memmingen in Bavaria—pasted within the cover of a Latin MS.; it represents St Christopher carrying the infant Saviour across the sea, and is dated 1423. Fig. 1. is a reduced fac-simile of this curious engraving.

Fig. 2.

ing. It is a work of some merit, notwithstanding its apparent roughness; the infant Saviour and the drapery of the saint being drawn with considerable skill and vigour. The inscription at the bottom has been thus translated: 'In whichever day thou seest the likeness of St Christopher, in that same day thou

wilt, at least, from death no evil blow incur.—1423.' Shortly afterwards, a series of books, printed entirely from wood-engravings, called block-books, were issued. They consisted principally of religious subjects, with short descriptions engraved on the same block. The most important of them were the *Apocalypsis, seu Historia Sancti Johannis*; the *Historia Virginis ex Cantico Canticorum*; and the *Biblia Pauperum*, the last containing representations of some of the principal passages of the Old and New Testaments, with explanatory texts. The illustrations, of which Mr Jackson, in his treatise on the *History and Practice of Wood-engraving*, gives an elaborate account and several specimens, seem to be drawn with a supreme contempt for perspective and proportion, but bear evidence of the draperies, and hands and faces, having been carefully studied. Fig. 2 is a copy of one of the cuts in the *Apocalypsis*. It represents St John preaching to three men and a woman, with the inscription: '*Conversi ab idolis, per predicationem beati Johannis, Drusiana et ceteri*' (By the preaching of St John, Drusiana and others are withdrawn from their idols). Fig. 3, from the *Biblia Pauperum*, is curious as shewing the general manner of representing the creation of Eve during the 15th c., the same subject frequently occurring previous to 1500. Both have the appearance of careful drawings 'spoiled in the engraving.' Previous to the invention of movable types, whole books of text were also engraved on wood, and the impressions had evidently been taken

Fig. 3.

by *rubbing* on the back of the paper, instead of steady pressure, as in the printing-press, the ink used being some kind of distemper colour.

The Psalter printed by Faust and Schöffer at Mentz in 1457 (see GUTENBERG), is illustrated with initial letters engraved on wood, and printed in two colours, blue and red, which Mr Jackson considers 'the most beautiful specimens of this kind of ornament which the united efforts of the wood-engraver and the pressman have produced. They have been imitated in modern times, but not excelled.' It is worthy of note, that although printed upwards of 400 years ago, the freshness and purity of the colours remain unimpaired.

As printing spread, the publication of illustrated books became general in Germany and Italy, and

reached England in 1476; in which year Caxton (q. v.) published the second edition of the *Game and Playe of the Chesse*, with figures of the different pieces. They are very rude, compared with the earlier German works. Fig. 4 is a reduced copy of the 'Knight,' and is interesting as one of the first

Fig. 4.

wood-engravings executed in this country: several works followed, all, however, in the same rude manner. The first attempt at something finer than simple lines appears in the frontispiece to the Latin edition of Breydenbach's *Travels*, printed at Mentz by Erhard Reuwich, 1486. It is by an unknown artist, and is an elaborate and really very beautiful specimen of the art. It is also remarkable as being the first engraving introducing *cross-hatching* to represent dark shadows. The *Hyperotomachia Poliphili*, printed at Venice by Aldus, in 1499, is worthy of mention for the extreme beauty of the designs, which have been ascribed by some authorities to Raphael, and by others to Mantegna. About the beginning of the 16th c., a complete revolution in the art of wood-engraving was accomplished by the genius of Albert Dürer. His productions exhibit not only correct drawing, but a knowledge of composition and light and shade, and attention to the rules of perspective, which, with the judicious introduction of subordinate objects, elevated them to the rank of finished pictures. Dürer, however, in common with most of the German artists of his day, paid very little attention to the propriety of costume in his religious subjects; one of his drawings in the *History of the Virgin* (1511), for instance, representing the birth of the Virgin, shews the interior of a German burgomaster's house of his own day, with a number of gossips drinking from flagons, and otherwise enjoying themselves. There has been considerable discussion as to the probability of Dürer having also *engraved* his drawings. Most of the best authorities on the subject, including Bartsch, Jackson, and Firmin Didot, agree in the negative. Mr Jackson, who speaks with the experience of a practical engraver, says: 'In most of the wood-cuts supposed to have been engraved by Albert Dürer, we find *cross-hatching* freely introduced: the readiest mode of producing effect to an artist drawing on wood with a pen or a black-lead pencil, but which, to the wood-engraver, is attended with considerable labour. Had Albert Dürer engraved his own designs, I am inclined to think that he would have endeavoured to attain his object by means which were easier of execution.' The reader is referred to the article DÜRER for an account of

some of his numerous works. The best of Dürer's contemporary artists on wood were the painters, Hans Burgkmair (q. v.), Lucas Cranach (q. v.), and Hans Schüfflein. A series of works projected by the Emperor Maximilian, including *The Adventures of Sir Theurdank*, *The Wise King*, *The Triumphs of Maximilian*, &c., were illustrated by these artists; but they are not equal to those of Dürer.

During the first half of the 16th c., the publication of books illustrated with wood-engravings still increased, and prevailed to a greater extent than at any other time, with the exception of the present day. The superiority of talent, both in drawing and engraving, however, still remained with the Germans. In France, although their figure-subjects were inferior to those of their German neighbours, their ornamental borders in prayer-books, &c., of which a great number were printed at this time, were extremely beautiful. In Italy and England, the art was very far behind. The most remarkable work published at this time was the *Dance of Death* (q. v.), issued at Lyon in 1538. The original edition of this curious work contained 41 engravings, representing the struggle between Death, generally in the form of a skeleton, and different individuals, such as the Pope, the Emperor, a Judge, Monk, Doctor, Duchess, Old Man, &c. The drawings, which are characterised by great vigour and skill, are generally understood to have been executed by Hans Holbein (q. v.); but whether he also engraved them, as has been alleged, is more than doubtful. Towards the conclusion of the century, however, the art had made considerable progress in Italy, where some of the best productions of Germany were equalled, if not excelled. In England, it did not make much progress. John Daye published almost the only illustrated books of the time, notably Queen Elizabeth's Prayer-book, which contains a tolerably well executed portrait of Her Majesty. There is no certain knowledge about any of the artists or engravers, although John Daye is supposed to have engraved some of his cuts himself. At this time also, the practice of printing wood-engravings in colours from different blocks became somewhat common, although the attention of artists in that line was mostly confined to ornamental subjects. From the beginning of the 17th c., the decline of wood-engraving may be dated; Germany, the cradle of the art, being the first to forsake it; the only works worthy of notice were a series of blocks on various subjects—designed by Rubens, and engraved by Christopher Jegher of Antwerp, one of the best wood-engravers of that period—some of which are of great beauty. From this time, the art fell into a state of great neglect, not, apparently, for want of engravers, for wood-cuts of a certain kind were always produced, but for want of artists able, or willing, to make drawings worthy of preservation.

Nothing particularly deserving of notice occurred until 1766, when John Michael Papillon, an enthusiastic professor of the art in France, published an elaborate history of the subject in an unsuccessful attempt to restore it to its former importance. But it was not until the genius of Thomas Bewick (q. v.) was brought to bear on it, that wood-engraving received that impetus which has made it what it now is—one of the most important of the illustrative arts. Bewick's most important works are his *Histories of British Quadrupeds* (1790) and *British Birds* (1804); all the quadrupeds, and almost all the birds were drawn and engraved by himself. The birds, especially are executed with a truthfulness and skill which has rarely if ever been equalled. These works are also famous for their collection

of tailpieces, which display an infinite amount of humour and pathos. Fig. 5 is a reduced copy of one of them—a poor ewe, in the starvation of winter, picking at an old broom in front of a ruined cot—a scene, trifling as it seems, which tells a woeful tale of suffering. He entirely abandoned the elaborate

Fig. 5.

system of 'cross-hatching' which prevailed so much in the works of the older engravers, and produced his light and shade by the simplest possible means. The above example affords an excellent specimen of a wonderful effect being produced by a few simple lines.

Since Bewick's time, wood-engraving has continued to flourish without interruption. He left behind him several pupils, the most successful of whom were Nesbet, Clennell (who engraved some of the tailpieces in the *British Birds*), and William Harvey. Harvey, however, forsook the burin for the pencil; and his drawings illustrating Milton's *Paradise Lost*, Thomson's *Seasons*, &c., especially such as were engraved by John Thomson (perhaps the most skilful engraver that ever lived, and a pupil of Robert Branston, a self-taught engraver), still retain a first-class place as specimens of wood-engraving. The establishment of the *Illustrated London News* (1842) tended greatly to familiarise the public with the beauties of wood-engraving. In the pages of that periodical appeared the first drawings on wood of Messrs John Gilbert and Birket Foster. The spirited figure-subjects of the former, and the exquisite landscapes of the latter, have done much to raise the art to the very high place it now occupies in England.

Of late years, the art has also made very great progress in France and Germany. The style of engraving, however, is quite different from the English, so much so, that a practised eye can distinguish a French wood-cut at a single glance. The professors of the arts of drawing and engraving on wood in the present day are so numerous, and their works generally so well known, that it would be needless, even if our space permitted, to attempt even to enumerate them.

Practice of Wood-engraving.—The wood used for engraving is boxwood, which has the closest grain of any wood hitherto discovered. It is principally imported from Turkey for the purpose, as the English box is too small to be of much use. It is cut across the grain in slices, which are dressed to the same height as type, for convenience in printing. Inferior kinds of wood, such as American rock maple, pear tree, plane-tree, &c., are used for coarser purposes; and for very large and coarse subjects, such as posting-bills, common deal is used, and cut on the side of the wood with chisels and gouges. When blocks—as the pieces of wood are termed—are required of a larger size than a few inches square, it is necessary to join two or more pieces together, as the amount of sound wood to be got out of even a large slice is extremely limited.

WOOD-ENGRAVING.

There is, however, for all practical purposes, no limit to the joining process, as blocks have been printed consisting of from 50 to 100 pieces. The wood having been made very smooth on the surface, and squared to the required size, is prepared for the artist by being covered with a preparation of white (commonly water-colour (Chinese white)); this gives a very good surface for the pencil to work on. The subject is then drawn in the ordinary way, the tints being generally washed in with India-ink, and the details filled in with pencil. When the drawing is finished, it is given to the engraver, who, previous to commencing, carefully covers the block with paper, fastened round the edges with bees-wax; this is necessary, to avoid rubbing the drawing out in the process. As the engraving proceeds, he gradually tears the paper off.

The tools or gravers necessary in wood-engraving are of three kinds—viz., gravers proper (fig. 6, a); tint-tools (fig. 6, b); and scoopers, or cutting-out tools for clearing out the larger pieces (fig. 6, c).

Fig. 6.

They are arranged in different sizes, to suit the different portions of the work. Fig. 7 represents the method of using the graver.

Fig. 7.

use a glass of slight magnifying power, more for the purpose of relieving the eyes from the strain of fixing both eyes closely on a small object, than for magnifying the work. When gas or other artificial light is used, a glass globe filled with water, slightly tinted with blue (to neutralise the reddish glare of the light), is placed between the flame and the work: this serves the double purpose of concentrating the light on the block, and keeping it out of the eyes. When the drawing is in outline, or mostly so, the engraving is very simple: the process consists of engraving a line along each side of the pencil lines, which are, of course, to be left in relief, and afterwards cutting out the pieces between. It will thus be understood that every part of a woodcut which prints on the paper is the surface of the wood left untouched, and that every white part is cut or hollowed out. Fig. 8 represents a little subject *outlined*; fig. 9 is the same subject *finished*. When it is complicated with much shading, trees, &c., it becomes much more difficult, and brings into play the artistic talents of the engraver to preserve the proper shades, or colour, as it is technically termed, and texture of the different objects. Some engravers of the present day are celebrated for their power of producing

beautiful pictures altogether by 'graver-work' from drawings made entirely with the brush. Skies and flat tints are engraved with tint-tools which, from

Fig. 8.

Fig. 9.

their shape, are best adapted for cutting straight lines; and by the judicious use of the different sizes, the lines are left wider or closer, thicker or thinner, as the tint is wanted darker or lighter. As already mentioned, the tools are arranged in sizes—i. e., those for light tints are broader at the points than those for dark tints, so as to cut out more white. Trees, foregrounds, &c., are cut with *gravers*, which, as they are like a lozenge in shape, give more scope for freedom of handling.

When the drawing is all engraved, a proof is taken by inking the surface gently with printing-ink on a dabber (a ball of cotton covered with silk), and, a piece of *India-paper* being laid on it, by rubbing the paper with an instrument called a *burnisher*, until it is all printed. The engraver then sees what touching up is required—a light part to be softened here, a hard dark part to be toned down there, &c.—before it is finished and ready for the printer.

When large blocks are to be engraved, the pieces of wood are joined with screw-bolts, and the drawing prepared in the usual manner; after which the pieces can be taken separate for convenience in engraving, and also for the purpose of getting it quicker finished, by having an engraver working at each piece—a matter of some consequence in many cases, as, for example, in the large engravings in the illustrated newspapers.

As wood-engraving, however, is at the best but a slow process, it is not surprising that many attempts have been made to introduce a substitute for it. The point aimed at is to produce by some process of etching (see ENGRAVING), or otherwise, an engraving in relief, directly from the drawing of the artist, without the intervention of the engraver at all. It would occupy several pages of this work merely to enumerate all the processes which have been invented to accomplish this end. The only one which, from its being partially successful, seems deserving of mention, is called the *Graphotype Process*. The drawing is made on finely-prepared chalk, with a preparation of silice; this hardens the chalk where it is applied; the spaces between the lines remaining soft, are then carefully removed by means of a brush; a cast or stereotype is then taken, as the chalk is of course too soft itself to be printed from. A company was formed in London some time ago to work out the patent, but, so far as we have seen, they have not yet produced much more than specimens.

See Jackson and Chatto's *History and Practice of Wood-engraving* (new ed., Lond. 1861); Papillon's *Traité de la Gravure en Bois* (Paris, 1768); Bartsch's *Peintre-graveur*; Ottley's *Inquiry into the History of*

Engraving on Copper and Wood; Firmin Didot, Essai sur l'Histoire de la Gravure sur Bois (Paris, 1863).

WOOD-LOUSE (*Oniscus*), a Linnæan genus of Crustacea, now forming the family *Oniscidae*, of the order *Isopoda*. The antennæ are four in number, but two of them are very short, consisting of two joints at most; the other two are long and slender. The tail is very short, but is composed of six segments. Wood-lice are terrestrial, and the respiratory organs are completely enfolded by plates developed from the abdominal members; the anterior plates being perforated by a row of small holes, through which the air has access to the gills. They frequent damp situations, and are generally found in dark and concealed places, under stones, in holes of walls, under the decaying bark of trees, &c.

Wood-louse
(*Oniscus murarius*).

They feed on decaying animal and vegetable matter. They run with some celerity when apprehensive of danger, and sometimes also roll themselves up into a ball, so as to exhibit only the plates of the back. The eggs are enclosed in a pectoral pouch. The Common W. (*Oniscus murarius*) is very abundant in Britain, and is to be found in almost every locality suitable for it. It is popularly known in Scotland by the name of *Slater*.

WOOD-OIL, the name commonly given by Europeans in India to a balsamic fluid, not really an oil, obtained from the trunks of trees chiefly of the order *Dipteraceæ* (q. v.). The wood-oils of Indian commerce are generally named from the countries or places from which they are brought, and it is not yet known what trees yield particular kinds, although it is certain that most of them are produced by species of *Dipterocarpus*. The name *Gurgina Balsam*, or *Goorjun Balsam*, is frequently given to one of the most common kinds, the produce of the Goorjun tree, *Dipterocarpus turbinatus*, and other species of *Dipterocarpus*. Wood-oil is produced chiefly on the Burmese coast, and in the more southern and eastern regions. It is obtained by tapping the tree, and applying heat to the incision; or by felling the tree, cutting a hole in the trunk, and kindling a fire in it, a groove being made for the exuded fluid to flow into pots placed to receive it. The trees which produce it being often very large, a single tree sometimes yields seven tons of oil. Wood-oil is used in medicine as a substitute for *Copaiva* (q. v.), and in the arts as a varnish, often in combination with coloured pigments, and even as a substitute for tar in paying the seams of shipping. It is very effectual in preserving timber from the attacks of white ants. It is sometimes used in making lithographic inks. Wood-oil has a fine aromatic odour, resembling that of cedar. When allowed to remain at rest for some time, it separates into two layers, the upper consisting of a clear chestnut-coloured liquid balsam, and the lower a kind of resin in flakes. It is, of course, this resinous part only which remains when it is used as a varnish, and the varnish has dried.

WOODPECKER (*Picus*), a Linnæan genus of birds, now divided into a number of genera, and belonging to the family *Picidae*, of the order *Scansores*. The toes are in pairs, two before and two behind, with sharp strong claws; the bill is rather long, straight, and wedge-shaped, with a hard tip, the tip and sides compressed; the tail is usually

lengthened and rigid, although in some it is short and rounded; the vertebrae of the neck are greatly developed, and the last of the caudal vertebrae is very large, with a long ridge-like spinous process; the whole structure adapting these birds to run and climb with the greatest facility on the stems and branches of trees, in which they aid themselves by the tail, like Creepers (q. v.), and to seek their food, which consists chiefly of insects and their larvæ, by digging in the bark and wood of trees with their bill. In addition to the particulars already noticed, they have the tongue fitted to serve as an important instrument in obtaining their food; the branches of the hyoid bone being greatly elongated backwards, and in front moving as in a sheath; a peculiar arrangement and development of muscles enabling them to extend the tongue far beyond the bill; its tip being horny, and furnished with barbed filaments, whilst its surface is covered with a glutinous saliva, secreted by two large glands. Their powers of flight are very moderate, and the keel of the breast-bone is small. The Barbets (q. v.) and Wrynecks (q. v.) are referred to the family *Picidae*. Woodpeckers are diffused over almost all parts of the globe, but abound chiefly in warm countries. The species are very numerous. They are mostly solitary in their habits, and live in the depths of forests. They feed in part on fruits and seeds as well as on insects; but much of their time is spent

Green Woodpecker (*Picus viridis*).

in pursuit of these, and they may be heard at a considerable distance, tapping the wood of trees with their bill, to discover the place where an insect is lodged, and to get at it when discovered. The common notion, that they are very injurious to trees, is erroneous, as they do more good by preventing the ravages of insects than harm by their pecking. They strike out chips of wood with their strong bill, and in this way enlarge holes in decayed parts of trees for a roosting-place or a nest, carrying away the chips to a distance, especially in the case of a nest, as if for precaution that it may not be discovered. The nest consists of a mere hole in a tree, perhaps with a few chips in the bottom of it, but with no other lining. The plumage of woodpeckers is generally of strongly contrasted colours, black and white, or green and yellow, with red marks about the head. There are several well-marked groups of woodpeckers, differing in form, plumage, and habits, which also are of different geographic distribution, some of them being entirely, and some chiefly confined to particular parts of the world.

Only four species are found in Britain, and one of them, the GREAT BLACK W. (*Picus* or *Dryocopus martius*), is of rare occurrence. It is about sixteen inches long; black, with a red cap on the head. It is found in the pine-forests of many parts of Europe.—The GREAT SPOTTED W. (*P. major*), also called FRENCH PIE and WOOD PIE, is not uncommon in some parts of England, but is rare in Scotland. It is found on the continent of Europe from Norway to the Mediterranean. It is about nine inches and a half in length. The colour is black, varied with white, the under parts grayish white; the back of the head in the male bright scarlet. The LESSER SPOTTED W. (*P. minor*) is not uncommon in the south of England. Its whole length is about five inches and three-quarters. It is widely distributed in Europe and the north of Asia. Its colours are similar to those of the last species, but differently arranged. It is frequently to be seen searching for insects on the moss-covered branches of orchard trees.—The most plentiful of all the British species of W. is the GREEN W. (*Picus* or *Gecinus viridis*). It is found in the wooded parts of Scotland as well as in England, but is rare in Ireland. It is common on the continent of Europe from Scandinavia to the furthest south. It is about thirteen inches in length; and is mostly of a dark-green colour, tinged with yellow; the feathers over the nostrils and round the eye, black; the crown and back of the head, bright scarlet, a black moustache extending backwards and downwards from the base of the lower mandible, with a brilliant scarlet patch along the middle of it; the edges and tips of the wings spotted, black and white. It chiefly inhabits elm and ash trees, making its roosting-place and nest in them in the manner already described. Among its popular English names are *Woodspite*, *Yaffle*, *Whet-ile*, and *Woodwall*. The Green W. belongs to a group or section of woodpeckers entirely confined to the Old Continent, and which are more frequently to be seen seeking their food on the ground than the more typical species. The American species of W. are very numerous, and some of them, which want of space prevents us from describing, are amongst the best-known birds of the United States and Canada; as the HAIRY W. (*Picus villosus*), which is to be found at all seasons in woods, orchards, fields, and even in the midst of cities, visiting farm-yards in winter to pick up grain—a lively, noisy, and active bird; the IVORY-BILLED W. (*Picus* or *Campelophilus principalis*), which inhabits the southern parts of the United States and Mexico; is called *Carpentero* by the Spaniards, from the great quantity of chips which it makes; and is valued by the Indians for its ivory-like bill and scarlet crest, which they use as ornaments. The RED-HEADED W. (*Picus* or *Melanerpes erythrocephalus*) is very common in most parts of North America, and feeds much upon fruits and upon young heads of Indian corn, so that a reward is given for killing it. The largest species in the northern parts of America is the BLACK W., or LOGCOCK (*Picus* or *Dryolomus pileatus*), which is about eighteen inches long, the general colour greenish black, with stripes of white from the eyes along the neck and sides.—The genus *Picumnus* is the type of a group of *Picidæ* called *Piculets*, very small birds, with bill hard at the tip, broad rounded wings, and a short tail with broad rounded feathers, not used for support, departing from the typical characters of the family. They inhabit the warm parts of South America, India, and the Eastern Archipelago.

WOOD-PRESERVING. Several processes have been employed of late years for the purpose of preventing the decay of wood from damp, atmospheric

action, or the destructive operations of animals and parasitic plants. The principle in all has been the same—viz., the injection into the vessels of the wood of some mineral material, which, by combining with the albumen of the woody tissue, prevents its decomposition, or gives it a poisonous character. The chief of the methods in use are that called *Kyanising* (q. v.), *creosoting*, in which the preserving material is the so-called creosote, or crude carbolic acid of coal-tar, and the *Boncherie* process, chiefly used on the continent. In this last, a solution of sulphate of copper is used. Whilst the tree is still growing, the head of the tree is cut off, and the top of the bare stem is hollowed into the form of a bowl, which is then filled with the solution, which is afterwards supplied as required. The liquid penetrates downwards, killing the tree as it goes, but giving to the wood a most remarkable degree of durability, particularly when applied to such purposes as railway sleepers, &c.

WOODRUFF (*Asperula*), a genus of plants of the natural order *Rubiaceæ*, containing a number of annual and perennial species, with whorled leaves, natives of the northern parts of the Old World, and distinguished by a funnel-shaped or bell-shaped corolla, a bifid style, capitate stigma, and dry didymous fruit. The SWEET W. (*A. odorata*) is common in shady woods in Britain and all parts of Europe. It has a creeping root, a stem 5—10 inches long, weak and suberect, four or five whorls of lanceolate leaves, 6—8 in the whorl, rough at the edge and keel, and small white flowers. The plant, when dried, has a very agreeable fragrance, similar to that of *Anthoxanthum odoratum* (see VERNAL GRASS) under similar circumstances. It forms an agreeable herb-tea, and enters into the composition of the popular *May-drink* of the Germans.—DYER'S W. (*A. tinctoria*) is a native of the continent of Europe and of Siberia, a perennial, with reclining stems about a foot in length, whorls of six or four linear leaves, the upper leaves opposite, the flowers whitish. The root is used in Dalmatia and elsewhere instead of madder; but the crop obtained from a field is inferior in quantity to that of madder.

Woodruff
(*Asperula odorata*).

WOODS AND FORESTS, AND LAND REVENUES, COMMISSIONERS OF. In ancient times, the principal part of the royal revenues of England consisted of the rents and profits of the crown-lands, which were composed of numerous lordships and honours, with forests and chases. The demesne lands reserved to the crown at the Conquest were at one time very extensive; but while they were often added to by forfeitures, they were also so largely encroached on by grants to subjects, that from the 12th to the 14th c., parliament had often to interpose to compel the resumption of grants thus made. The confiscation of the property of the monasteries under Henry VIII., greatly

increased the real estate of the crown; and, notwithstanding alienations by that monarch and by Queen Elizabeth, who disposed of part of the royal domains, to avoid application to parliament for supplies, the crown, at the accession of James VI., owned very extensive estates all over England. The profusion, however, of James and his successors reduced the royal estates to insignificance, and no effectual restraint was imposed on their dilapidation until statute 1 Anne, c. 1, prohibiting all alienations of the crown-lands, except by leases not exceeding 31 years, or three lives. From the reign of Henry VIII. to that of George III., the crown revenues were subjected to repeated changes of management; and under George III., the system was first introduced of surrendering the greater part of them to be consolidated with the rest of the public revenue, out of which the royal civil list is paid. The modern administration of the land revenues of the crown is founded on a statute of 1810, establishing a Board of not less than two, or more than three Commissioners, called 'The Commissioners of his Majesty's Woods, Forests, and Land Revenues.' The law relating to the management of the crown-lands was consolidated by act 10 Geo. IV. c. 50, which, repealing a number of previous enactments on the subject, placed the whole hereditaments of the crown in England, Wales, and Ireland, except advowsons and vicarages, under the management of the Commissioners of Woods and Forests, with large power of selling and leasing them; and provided that the annual land revenues should, subject to certain deductions, be carried to the Consolidated Fund during the king's life. This transfer to the Consolidated Fund, the result of a special agreement terminating with the life of the sovereign, has been renewed with his successors. Act 2 and 3 Will. IV. c. 112, empowered the Treasury to transfer to the Commissioners of Woods and Forests the management of the crown-lands of Scotland.

A large addition was made to the duties of the Commissioners of Woods and Forests by 2 Will. IV. c. 1, which, abolishing the office of Surveyor-general of his Majesty's Public Works and Buildings, intrusted to them the management of the public works. This union, however, was afterwards considered inexpedient, and act 14 and 15 Vict. c. 42, removed the department of Public Works from the Woods and Forests, and placed it under separate control. A recent act, 29 and 30 Vict. c. 62, has introduced various alterations in the details of management. The Commissioners of Woods and Forests act under the control of the Treasury, and are required to transmit annual accounts of the receipt and expenditure of their department, to be audited by the Commissioners for auditing Public Accounts. The yearly receipts from this source amount to about £320,000. See WORKS, BOARD OF.

WOOD-SORREL. See OXALIDEÆ.

WOODSTOCK, a small town and parliamentary borough, Oxfordshire, 8 miles north-north-west of the city of Oxford. The pop. of the borough (which includes several adjacent villages and hamlets) is 7827, and is much larger than that of the town, which contains only 1200 inhabitants. The manufacture of fawn-skin gloves gives employment to about 1200 persons, residing in the town and neighbouring villages. W., or rather Old W., a little to the north of the present town, was a residence of the early English kings; but no remains of the ancient palace exist. Edward, the Black Prince, was born here; Elizabeth was held prisoner by her sister Mary; and Chaucer resided here for some time. W. is also famous in connection with Fair Rosamond, the

celebrated mistress of Henry II. It is now doubted, however, if the labyrinth or maze which Henry is said to have constructed for her behoof ever existed. In the immediate vicinity is Blenheim Park, the seat of the Duke of Marlborough. W. returns one member to the House of Commons.

WOOD-SWALLOW (*Artamus*), a genus of birds, resembling swallows in many of their habits, but differing in the structure of their bills and feet, and belonging to the family of *Ampelidæ*, or Chatterers (q. v.). The bill is very broad at the base, and arched; the upper mandible thick, but not ridged; the gape furnished with bristles; the nostrils wide apart, naked; the feet short and strong; the wings very long and pointed; the tail short. Their flight is rapid. Their food consists chiefly of seeds. They are natives of the East Indies and of Australia. An Australian species (*A. sordidus*) is sometimes seen in great numbers, and is remarkable for the habit of suspending itself in clusters on dead branches, like a swarm of bees, one bird clinging to another, so that as many thus hang together as would fill a bushel.

WOOL is a variety of Hair (q. v.). The term hair is applied, in ordinary language, to a smooth, straight-edged filament like human or horse hair, without serrations of any kind on its surface. Wool, on the other hand, is always more or less waved, as in fig. 1; besides which, externally each woolly filament is seen under the microscope to be covered with scales overlying each other, and projecting wherever a bend occurs in the fibre; fig. 2, in which one of the leading varieties of wool is shewn, both in its

Fig. 1.

Fig. 2.

natural state (a in outline, and b complete) and after it has undergone the process of carding (c in outline, and d complete), in each condition both as a transparent and as an opaque object. Upon the minute points of difference here shewn, the value of wool chiefly depends, especially with regard to the great variety of its applications. If each fibre were straight and smooth, as in the case of hair, it would not retain the twisted state given to it by spinning, but would rapidly untwist when relieved from the force of the spinning-wheel; but the wavy condition causes the fibres to become entangled with each other, and the little projecting points of the scales hook into each other, and hold the fibres in close contact. Moreover, the deeper these scales fit into one another, the closer becomes the structure of the thread, and consequently of the cloth made of it. This gives to wool the quality of *Feling* (q. v.). By combing, or drawing the wool through combs with angular metal teeth, some of the scales are removed, and the points of many more are broken off, so that wool which has been combed has less of the felting property, and is consequently better adapted for light fabrics; and yarn made of such wool is called *worsted*, and the cloths made of it *worsted goods*. But such is the variety of wools obtained by careful breeding and selection, that these differences can be

got without combing, some wools being found to have naturally fewer serratures, and a less wavy structure, than others. These are consequently kept separate, and are called *combing-wools*; whilst those which are much waved, and have many serratures, are called *carding-wools*, from their being simply prepared for spinning by carding-machines. The serratures or points of the scales are exceedingly small, and require the aid of a good microscope to see them. They vary from 1200 up to 3000 to an inch.

Wool is the most important of all animal substances used in manufactures, and ranks next to cotton as a raw material for textile fabrics. Its use as a substance for clothing is almost universal in the temperate regions of the globe.

Previous to 1791, British woollen cloths were made almost wholly of native-grown wools. At that time, the whole supply of the country could not have much exceeded 100,000,000 lbs. The merino wool of Spain then began to displace them in the best kind of goods, and the imports from that country reached their maximum in 1805, being in that year 7,000,000 lbs. Before 1820, the German wool had begun to supersede the Spanish, and was imported largely till 1841. After that, the cheaper wool of the British colonies to a great extent took the place of the German, and the latter is now chiefly used for only the finest cloths.

Wool varies in character according to the peculiar breed of sheep which yields it, and also with the nature of the soil, food, shelter, and climate. In a wool of first-rate quality, the fibres are fine, soft, elastic, sound, of good colour, and free from deleterious or troublesome impurities: the commercial value of any sample depends, therefore, upon the extent to which it possesses these properties. If it be a combing wool, it will also depend upon its length of staple.

For technical purposes, shorn fleeces are divided into two classes, one called *hogs* or *legs*, the other *wethers* or *ewes*. The former are the first fleeces shorn from the sheep, the latter are those of the second and succeeding years; but the meaning of these terms varies a little in different districts. The fleeces of yearlings are, as a rule, longer in the staple, and otherwise of superior quality to the wool of older animals. In the south of England, it is customary to clip lambs, and the wool so obtained is called *shorn lamb's wool*. Wool taken from the skins of slaughtered sheep is called *skin-wool* or *pell-wool*, and is of a more variable quality than fleece-wool, on account of its being obtained in all stages of growth.

As long-stapled wools are used for worsted goods, and short-stapled for woollen goods, the various breeds which yield these two leading kinds are naturally divided into the long-woolled and short-woolled classes of sheep. The Lincoln, the Leicester, and the Cotswold breeds are considered good types of the former; and the Down, the Welsh, and the Shetland breeds, of the latter.

The following brief notice of the characteristic properties of the various native wools, is founded upon the description given of them in the Jury Report of the International Exhibition of 1862, Class IV.

Of the 'long wools,' the *Lincoln* has greatly risen in value of late years. It is coarse, of great length, and silky in appearance, so that it is well adapted for 'lustre' goods, in imitation of alpaca fabrics. *Leicester* wool is highly esteemed for combing. It is rather finer in the hair, but not usually so soft and silky in the staple as the last. *Cotswold* wool is similar to the Leicester, but somewhat harsher. It is not suited for lustre goods. *Highland* wool is

long stapled, and of coarse quality, but known to be susceptible of great improvements. The practice of 'smearing' greatly depreciates its value. It is chiefly used for the coarsest kinds of woollen fabrics, as carpets, rugs, and similar articles. It is also used for Scotch blankets.

Of the 'short wools,' the different breeds of Downs partake very much of the same characters, but soil and climate so far affect them. The *South Down* is a short-stapled, small-haired wool, the longer qualities of which are put aside for combing purposes, and the shorter for the manufacture of light woollen goods, such as flannel. The *Hampshire Down* differs from it in being coarser, and in having the staple usually longer. The *Oxford Down*, again, exceeds the last in length and coarseness of staple. The *Norfolk Down*, on the other hand, when clean, is of a very fine and valuable character. The *Shropshire Down* is a breed increasing in importance, and is longer in the staple, and has more lustre than any of the other Down breeds. *Ryeland* wool is fine and short, but the breed is nearly extinct. The *Welsh* and *Shetland* wools have a hair-like texture, deficient in the spiral form, upon which depends the relative value of high-class wools. They are only suited for goods where the properties of shrinking and felting are not required. Shetland wool is obtained of various natural tints, which enables it to be used for producing different patterns without dyeing.

Of the intermediate wools, *Dorset* is clean, soft, and rather longer, and not quite so fine in the staple as the Down breeds. The *Cheviot* has increased very much of late years in public estimation. It is a small, fine-haired wool, of medium length, and is suitable for woollen and worsted purposes, for which it is largely used.

Some of the British colonies are very important wool-producing countries, Australia in this respect standing far in advance of all other countries whatever. The Australian wool has in general a beautiful, short, silky staple, well adapted for the manufacture of soft, pliable, and elastic fabrics. All the settled districts of this continent have been found well adapted to the growth of fine-woolled sheep, and the extraordinary increase in the flocks forms one of the most remarkable features of the colony. The breed has sprung from three merino rams and five ewes taken out by Captain M'Arthur in 1797. The alpaca wool grown in Australia since the creature was introduced some years ago is of inferior quality; but this is supposed to have arisen from rearing the animals too near the coast, and hopes are now entertained of succeeding better with it inland.

The wool of Cape Colony has of late years been greatly improved by the introduction of merinos, and, as will be seen from the table below, the exports from it are increasing very rapidly.

Among the imports from India, wool has of late become an important article, the quantity having risen from about 2,500,000 lbs. in 1840, to 20,000,000 lbs. in 1860; but the supply has fallen off a little since. A great deal of the Indian wool is coarse and hairy, and can only be used for low-class goods. We may state here that the most costly of all wools is obtained from the Tibetan goat, and is found next the skin, under the thick hair of the animal. From it, the far-famed Cashmere shawls are made. The highest price of any quality which is sold is from 6s. to 7s. per lb. in the native markets, but the Maharajah of Cashmere keeps a strict monopoly over the best kind.

Turning now to European countries, it is somewhat sad to think that Spain, the native country of the merino, which not so long ago sent all the wool

WOOL—WOOLLEN AND WORSTED MANUFACTURES.

for the best English cloths, has allowed its quality to degenerate, and its once large supply to dwindle away. The wool of Saxony, Silesia, and some parts of Austria, which is obtained from sheep of the merino breed, is the finest produced in any country; and notwithstanding the lower price and nearly equal quality of the Australian, German wool is still employed for the finest broadcloths, some kinds of ladies' shawls, and a few other purposes. Great attention is paid to the breeding and rearing of sheep in Germany, and large flocks are reared for their wool alone. In Austria, the number of sheep is estimated at 30,000,000, and occasionally a fleece is obtained so fine that twelve hairs of it will only equal in thickness one hair from a Leicester sheep. France produces a large quantity both of fine and coarse wool. In Italy, the production of wool from mixed merino breeds has become a source of great wealth. Russia, as might be expected from its great extent, rears many qualities, from the finest merino to a very coarse kind. The wools of the remaining countries of Europe are of minor importance.

We must not omit to mention that the wools of South America are now attaining great importance, as will be seen by the table below, but it is necessary to state that of the 18,000,000 lbs. imported in 1865, nearly 3,000,000 lbs. were of alpaca (including llama and vicuna) wool. See ALPACA. The wool of the alpaca is very fine, from 6 to 12 inches long, of various colours, and well suited for certain kinds of goods, which are noticed under WOOLLEN AND WORSTED MANUFACTURES. South American sheep's wool is of an inferior quality.

Much finer wool would be produced in Britain than is at present, if it were not that the demand for mutton, and the unfitness of the merino sheep for supplying that article of good quality, lead our farmers to choose breeds which are primarily mutton-producing.

The following table will shew at a glance the remarkable changes which have taken place in the sources from which Great Britain has derived its supplies of wool, and also the steady increase in the aggregate quantity imported:

IMPORTS OF WOOL FROM THE PRINCIPAL COUNTRIES.

| Year. | Spain. | Germany. | Australia. | South Africa. | East Indies. | South America. |
|-------|-----------|------------|-------------|---------------|--------------|---|
| | lbs. | lbs. | lbs. | lbs. | lbs. | lbs. |
| 1810 | 5,952,407 | 775,335 | 167 | | | } Insignificant
previous to
1833. |
| 1816 | 2,968,607 | 2,816,555 | 13,611 | 9,623 | | |
| 1820 | 2,536,299 | 5,113,442 | 99,415 | 29,717 | | |
| 1830 | 1,643,515 | 26,073,382 | 1,967,379 | 83,407 | | |
| 1834 | 2,343,915 | 22,634,616 | 3,558,091 | 141,707 | 67,763 | |
| 1840 | 1,266,905 | 21,812,099 | 9,721,243 | 751,741 | 2,441,370 | 4,378,274 |
| 1860 | 440,751 | 9,166,731 | 39,018,221 | 5,709,529 | 3,473,262 | 5,296,648 |
| 1865 | 68,000 | 6,128,000 | 49,142,000 | 11,075,000 | 14,283,000 | 7,106,000 |
| 1860 | 1,000,000 | 9,292,000 | 59,166,000 | 16,574,000 | 20,214,000 | 8,350,000 |
| 1865 | 115,000 | 6,858,000 | 109,734,000 | 29,220,000 | 17,105,000 | 17,867,000 |

To get the total imports for each year, we would require to add the amounts from countries of lesser importance, which are not given; but in the annexed statement we give the total annual imports and exports for the three years 1855, 1860, 1865:

| | 1855 (lbs.). | 1860 (lbs.). | 1865 (lbs.). |
|-----------------------|--------------|--------------|--------------|
| Total Imports, | 99,300,000 | 148,396,000 | 212,206,000 |
| " Exports, | 29,453,000 | 30,761,000 | 82,445,000 |
| Left for Consumption, | 69,847,000 | 117,635,000 | 129,761,000 |

There are no very reliable statistics of the amount of wool annually produced in Great Britain. In 1858, Mr E. Baines of Leeds estimated it at 175,000,000 lbs., the value of which he computed to be £10,937,500, taking it at the average price for the previous thirty years—viz., 1s. 3d. per lb. Another estimate of the yield in 1864, makes it out to be nearly the same quantity. The price of the best Australian wool during the last ten years has probably averaged about 2s. 6d. per lb., and the best German wool, for the same period, about 3s. 6d. per lb. Some very fine qualities of the latter have sold at nearly 6s. per lb.

To get at the total raw material used in the woollen manufactures, we require to take in the startling amount of woollen rags, waste, and 'extract' of wool now used in the 'shoddy' trade. For the year 1865, the estimated amount of these materials was: shoddy (chiefly rags), home-made, 52,000,000 lbs.; shoddy (chiefly rags), imported, 22,000,000 lbs.; wool 'extract', 5,000,000 lbs.—total, 79,000,000 lbs. 'Extract' is the wool recovered from worn mixed fabrics where the cotton has been destroyed by a chemical process.

With respect to the wool, or woolly hair, of animals other than the sheep, which we have not already mentioned, the only one of much importance is mohair, or the wool of the Angora Goat (q. v.). Of this material, there were 5,402,000 lbs. imported in 1865. It is a white silky wool, with an average length of staple of from 5 to 6 inches. The demand for it is only of recent origin, and, as will be noticed in our next article, it is chiefly used for certain kinds of ladies' dresses. The hair of camels, bullocks, common goats, and several furs are also used to some extent for manufacturing purposes.

The grand total of wool, shoddy, and goats' hair employed in the woollen industries of Great Britain in 1865, cannot, therefore, be far short of 380,000,000 lbs. The total import of raw cotton in the same year was nearly 1,000,000,000 lbs.; but of this, more than 300,000,000 lbs. were re-exported.

WOOLLEN AND WORSTED MANUFACTURES. The spinning and weaving of wool was practised from an early period in Asia Minor, Greece, Italy, and some other countries. It is very probable that the first lessons which our ancestors received in this art were got from the Romans after the Conquest; but the origin of the manufacture as a great staple is generally supposed to date from the time of William the Conqueror, when some Flemish weavers came to England, and obtained the patronage of the queen. The trade, however, fell off during the troubles of succeeding reigns. In 1331, it revived again by another supply of Dutch weavers brought over by Edward III. In 1530, the introduction of the spinning-wheel gave a new impetus to the trade. French workmen, driven to England by the revocation of the Edict of Nantes in 1685, still further aided it by their skill in the making of fine cloth, and from that time to the

present it has steadily prospered. It is hardly necessary to state that the woollen trade has shared, in common with other leading textile manufactures, the great advancement they have received from the spinning-jenny, the mule, and the power-loom.

There are two great classes of manufactures using wool as a raw material: in the one where carded wool is employed, the goods are called 'woollen fabrics;' in the other, where combed wool is used, the goods are called 'worsted fabrics.' We shall first treat of the *Woollen Manufacture*.

As our articles on SPINNING and WEAVING are general, we shall here briefly state the chief stages in these processes, as applied to the manufacture of woollen cloth. A fleece of wool is first sorted by experienced sorters into several qualities, as first sort, or 'pick-locks;' second sort or quality; third sort or quality; and so on. Sometimes, it is only divided into three, sometimes into as many as six kinds. The 'scouring' is the next step, and consists in immersing the wool in an alkaline lye, which forms a soap with the natural grease of the fleece. This of course acts as a detergent, and cleans the wool thoroughly when it is washed in water. Upon the perfection with which the scouring is performed, depends in great part the beauty of the dye. It is often dyed at this stage, and is then said to be *wool-dyed*; if not dyed till it is woven, the cloth is said to be *piece-dyed*. For some purposes, it is dyed in the yarn.

Scoured wool, whether dyed or not, next undergoes the operation of 'wilying.' The 'willy' is a machine used to cleanse the wool from dust and other loose impurities. In many cases, seeds with hooked scales like burs are so thickly entangled in the wool, that it requires to be passed through a 'burring'-machine, and afterwards examined by 'pickers.' This is especially the case with South American wool, including that of the alpaca. After this, the wool is sprinkled with olive oil, which renders the fibres soft, flexible, and better fitted for later operations. The next process consists in tearing open the matted portions, and separating the wool into small tufts by means of a machine called a *teaser*, *tuicker*, or *devil*. It has a large cylinder studded over with iron pikes, which performs from 1000 to 2000 revolutions per minute, teasing the wool as it revolves, and throwing it out like flakes of snow.

The two next operations are called *scribbling* and *carding*, and are performed by two somewhat similar machines, the essential parts of which will be understood by referring to figs. 6, 7, and 8 in the article SPINNING. Each machine consists of a large cylinder surrounded by several small rollers, all covered with wire cards or brushes. These, acting like fine toothed combs, open out, mix, and blend the fibres into a uniform and continuous sheet or lap, in which state it leaves the *scribbler*; but in the *carder*, the sheet is at length converted into small rolls, say from a quarter to half an inch in diameter, which are afterwards joined together, and form the basis of the thread. In the next machine, called the *slubbing-billy*, these rolls are drawn out, slightly twisted, and, in short, half converted into yarn. The spindles upon which these *slubbs* or *slubbings* are wound pass them to the *spinning-mule*, where they are converted into finished yarn.

Comparatively recent improvements have made the operations of scribbling, carding, and slubbing continuous, mainly through the introduction of Apperly's patent feeder, and of a modification of the carding-machine called a *condenser*, which does away with the use of the slubbing-billy; so that what with the older machines is three separate pro-

cesses, with the newer may be said to be only one. Each of the foregoing operations occasions a certain amount of 'waste' wool, which is worked up again into inferior goods. It was, in fact, to such waste that the name *shoddy* was originally applied. In the spinning process, the warp yarns, having to bear the strain of the loom, are made in a different way from those for the weft, and they are besides hardened with size.

The difference between woollen and worsted fabrics is owing in great part to the way the yarn for each is spun. Yarn for woollen cloth is very slightly twisted, so as to leave the fibres as free as possible for the felting process; worsted yarn, on the contrary, is hard spun, and made into a much stronger thread. On account of the feebleness of woollen yarn, it is more difficult to weave it by power-looms than either worsted, cotton, linen, or silk.

Woollen cloth is now woven chiefly by power-looms. See LOOM and WEAVING. When the cloth is taken from the loom, it has a bare look, and is called the *raw thread*. It first requires to be *brayed* or *scoured*, to remove the oil added to the wool before spinning, and the size added to the warp. This is done by immersing it in some ammoniacal detergent liquid, such as urine and hog's dung, and squeezing it between rollers, or beating it in the fulling-stocks, and then rinsing it in clean water. The cloth then passes to the *burler*, who removes any knots or burls, and helps any imperfections. The next process to which it is subjected is the *milling* or *fulling*, and it is a very important one. In some mills, this is still done by beating the cloth in the *fulling-stocks*, which are heavy wooden mallets, raised by wheels with projecting cams; but a newer *fulling-machine* has come into use, in which the cloth is felted by passing it in a confined space between heavy rollers. With either machine, a thick solution of soap is used, and in the fulling-stocks an ordinary broadcloth will take 60 hours to mill, but a considerably shorter time suffices in the fulling-machine. The result of the operation is, that the fibres of wool become so interlocked—so thoroughly felted—as to leave no appearance of thread. The shrinkage of the cloth in the milling is sometimes nearly a half in the width, and about a fourth in the length. Another scouring follows the milling, and after that the nap or pile of the cloth is *raised* by Teasels (q. v.). These curious thistle-like heads are set in frames, which are arranged upon a large cylinder—the whole apparatus being called a *gig-mill*. As the cylinder revolves, the spines of the teasels raise the nap, which is afterwards cut by a process termed *shearing*. For this purpose, a cutting-machine with spiral blades arranged round an iron cylinder, is used; and when it revolves, the spiral cutters, acting against a straight steel blade, shear off the nap of the fabric like scissors. The cloth is then boiled, or 'scalded,' to impart a lustre to it, and to prevent spotting with rain. After this it is dyed (if this is not previously done in the wool), and finally it is pressed between polished iron plates in a powerful hydraulic press. With respect to the dyeing of black cloth, it may be as well to explain that the term *woaded colours*, so commonly used in the trade, originally meant that Woad (q. v.) was used in conjunction with indigo as the basis of the colour—a combination which produces the best and most durable colour. Of late years, however, the name has been applied to the colour of the fabric when indigo itself has been used as its basis. It is only the finest cloths that are now dyed in either of these ways—logwood, a salt of iron, and galls being much more generally employed to produce a black.

WOOLLEN AND WORSTED MANUFACTURES.

Names are given to various kinds of woollen cloths according to the style in which they are finished, the special material of which they are made, and the purpose for which they are intended. *Broadcloths* are classed into 'superfines,' running from 56 to 60 inches wide; 'mediums' from 54 to 58 inches; 'double milled' from 54 to 56 inches; and Venetians, which are twilled fabrics, from 54 to 58 inches. The general term broadcloth also includes the following varieties, which, for the most part, have less highly-finished surfaces—viz. meltons, beavers, pilots, cloakings, china striped cloths, India cloths, elastic glove cloths, and union cloths which have cotton warps and woollen wefts. *Narrow cloths*, which average about 27 inches wide, include cassimeres, a thin, fine, twilled fabric; doeskin, also twilled, a strong, smooth-finished, sometimes treble-milled cloth, now usually dyed black for trouserings; Tweeds (q. v.), which have very much taken the place of fancy doeskins; and several other varieties. Then there are special kinds both broad and narrow—such as army cloths, rifle cloths, police cloth, upholstery cloth, carriage cloth, coffin cloths, and many more. Flannels, blankets, and some kinds of shawls, are also included among woollen goods.

The public taste has changed very much of late years with respect to the finish of woollen cloths. Formerly, a firm, close, and hard fabric, with a highly-dressed or glossy surface, was in demand; now, a softer and more pliable finish, without gloss, is in favour. Foreign manufacturers think, however, that a soft, rich, elastic cloth is apt to lose in strength what it gains in appearance, and do not finish so highly as the English. The desire for fancy woollens is another marked feature of the taste of the present day, and compels manufacturers to expend considerable sums in the preparation of designs and colours. It has also led to the enlargement of old, and the establishment of new art-schools in both the woollen and worsted centres in Yorkshire.

Of all the changes, however, which the present generation has witnessed in this trade, the most remarkable is doubtless the production of cheap cloths by the use of shoddy; although cotton warps have also done much in the same direction. Prepared shoddy is obtained, for the most part, by tearing up woollen rags by a *swift*, with ten or twelve thousand iron spikes upon it, revolving inside an iron cylinder. Shoddy now enters to a greater or less extent into the composition of all but the very finest woollen cloths. It began to be used about 50 years ago, but the prejudice against it is scarcely yet overcome. In spite of this feeling, it has become so necessary, that to stop the supply, would be to shut one-third of the woollen mills in the kingdom. The excellent finish now given to woollen cloths containing a large proportion of shoddy, and also cloths with cotton warps, is quite surprising; and, moreover, their cheapness has brought comfortable clothing within the reach of the humblest classes. Cloths with too large an amount of shoddy in them are easily torn; but if a judicious admixture of pure wool has been employed, they wear comparatively well. Formerly, the only use of woollen rags was to make flocks for wall-papers, for saddlers' stuffing, and some minor purposes—the greater part being used as manure.

In the British Islands, the various branches of the woollen manufacture are very extensively diffused. According to a factory return made a few years ago, it was carried on in 22 counties of England, 10 of Wales, 24 of Scotland, and 6 of Ireland. The principal seat of the manufacture of superfine broadcloth is the west of England—Gloucestershire and

Wiltshire especially—where it has existed for centuries. But Yorkshire is the great seat of the woollen manufacture, if we take in all the kinds, Leeds and Huddersfield being the great centres. One-half of all the operatives in the woollen factories of the kingdom are employed in Yorkshire, and here, too, the trade has increased most rapidly, both in the last and in the present century, owing mainly, it is believed, to the success of the manufacturers in producing cheap goods. Blankets are made chiefly at Witney, in Oxfordshire; at Dewbury, in Yorkshire; and some places in the south of Scotland, & Halifax and the surrounding district is the chief centre for flannels, but they are also made largely in Wales. In Scotland, the woollen manufacture is a very extensive one, but it has, for the most part, been already described under TWEEDS.

The most recent authentic statistics of the woollen industry of the United Kingdom are for the year 1861, and are as under:

NUMBER AND SIZE OF FACTORIES.

| Divisions and Counties. | Number of Woollen Factories. | Number of Spindles. | Number of Power-looms. |
|----------------------------------|------------------------------|---------------------|------------------------|

| Total, Males and Females, | 76,309 | 9,812 | 862 | 86,983 |

The number of spindles and looms, as well as the number of persons employed, have considerably increased since 1861, partly owing, no doubt, to the rise in the price of cotton goods during the cotton famine.

At Huddersfield, in 1866, the following wages were earned, per week of 60 hours: *Males*—Spinners, 18s. to 30s.; weavers, 18s. to 23s. 6d.; pattern-weavers, 16s. to 30s.; pattern-designers, 30s. to 50s. The imports of woollen and worsted yarns (not distinguished in the returns) have increased from 1861 to 1865 as follows: In 1861, 1,577,000 lbs.; in

WOOLLEN AND WORSTED MANUFACTURES.

1865, 4,392,000 lbs. The value of woollen cloths imported in the same years was—in 1861, £119,854; in 1865, £190,221. In the annexed table, the

exports of woollen goods are given for 1860 and 1865, and shew the prosperous state of the trade:

| | QUANTITIES. | | VALUE. | |
|--|-------------|------------|------------|-----------|
| | In 1860. | In 1865. | In 1860. | In 1865. |
| Woollen yarns (lbs.), | not stated | 298,929 | not stated | £35,694 |
| Woolens : Cloths, coatings, &c. (yards), . . | 23,968,000 | 25,616,000 | £2,996,000 | 4,094,000 |
| Flannels, blankets, and baizes (yards), . . | 12,641,000 | 14,769,000 | 848,000 | 1,203,000 |

Although steadily advancing, yet the progress of the woollen manufacture has been less rapid and extensive than that of other textile fabrics, which is believed to be owing to its processes being more numerous and complex, to the greater variety of machines and of workpeople required, and to the high price of the raw material.

Worsted Manufacture.—Worsted yarn, as has been already said, is spun in a different way from woollen yarn. In the former, the fibres are arranged as parallel as possible; in the latter, they are crossed in every direction, so as to assist the felting or milling of the cloth. For worsted, the wool is first combed, which is still done by hand as well as by machinery. When done by hand, the wool-comber performs his work with a pair of combs, each containing two or three rows of steel teeth (fig 1), which he uses in a heated state. The wool, after being previously oiled, is stuck on one comb, and the teeth of the other are then drawn through it, till the second comb transfers most of the wool to itself. The process is alternately repeated with each comb until the fibres are quite parallel. The dressed wool is then withdrawn, and is called the *top*; but there remains in the teeth of the comb some short

Fig. 1.

wool, called the *noil*, which is sold to the cloth-makers. In this first combing, the wool is in a heated state, and requires to be combed a second time at a lower temperature.

The introduction of machines for combing wool has formed quite an epoch in the worsted trade. Previous to 1846, all the machines invented for this purpose were imitations of the hand process, and had the defect of producing too much short and too little long wool. In that year, Heilmann patented in England an ingenious machine, which was not, however, introduced till 1849. Lister's machine, introduced in 1851, was an improvement upon it; but the close resemblance led to a protracted litigation, which ended in the latter purchasing Heilmann's patent for £30,000. With the aid of the annexed diagram (fig. 2), Heilmann's machine will be understood by a brief description. The prepared wool is supplied to it at W, and passes down till a pair of nippers seize it at N, leaving a portion of the wool hanging down. A revolving drum or cylinder, D, then moves round till that portion of it shewn with teeth enters the overhanging wool, and combs it. The plain portion of the cylinder follows, and as it reaches the drawing-rollers at R', turns them by friction. These rollers lay hold of the combed wool, and then the nippers open, and press the uncombed portion up into the teeth of combs at C, C'. The drawing-rollers, still holding the tuft of wool, then pass, by a peculiar arrangement, from their position

at R' to a lower one at R. Here the partially-combed wool gets a second combing from the cylinder, and passes off by rollers at S in a continuous sliver, which is accomplished by making one

Fig. 2.

tuft of wool slightly overlap the one before it. Two card-rollers at Z remove the noils, or short wool, from the teeth of the cylinder.

Most of the later combing-machines are also patented, and descriptions of them will be found in the specifications of patents. We are not aware that a very decided preference has been given to any special one; and to describe them all, even in the briefest way, would lead us beyond our limits.

The remaining processes in worsted spinning closely resemble those for cotton, and are sufficiently described under SPINNING; but the following table, which merely enumerates the products of the various stages, may not be uninteresting: 1. Fleece (Lincoln wool). 2. Combed 'top.' 3. Noils, or short wool. 4. Sliver from first drawing-frame. 5, 6, 7, 8, 9, and 10. Slubbings from second, third, fourth, fifth, sixth, and seventh drawing-frames. 11. Roving from roving-frame. 12. Yarn No. 24 for the fancy trade, 10 $\frac{1}{2}$ drs. per 560 yards. 13. Yarn No. 36 for de laines, &c., 7 $\frac{1}{2}$ drs. per 560 yards. 14. Yarn for Coburgs, &c., 6 $\frac{1}{2}$ drs. per 560 yards. Alpaca and mohair are combed and spun in a similar way to the worsted yarns from sheep's wool.

Those cloths manufactured from worsted yarns which are figured, are of course woven by various kinds of looms (see JACQUARD LOOM and LOOM); plain kinds are woven in looms similar to those used for woollens. When worsted goods leave the loom, they require only a superficial dressing, and in this respect differ much from woollen cloths, which we have seen require elaborate finishing processes.

Worsted stuffs are usually classified according to the materials of which they are composed, viz.: 1. Fabrics composed entirely of wool. 2. Fabrics

WOOLLETT—WOOLSACK.

composed of wool and cotton. 3. Fabrics composed of wool and silk. 4. Fabrics composed of wool, silk, and cotton. 5. Fabrics composed of alpaca and mohair mixed with cotton or silk. The first of these classes includes the fabrics so well known under the name of 'merinos,' and so called because they were first made of Spanish wool: for the 'double-twilled' kinds, the French still maintain their superiority; but for the 'single-twilled,' the Yorkshire makers are considered the best. This class also comprises shalloons, says, serges, lastings—all stout and heavy fabrics—besides durants, buntings, mo-reens, damasks, reps, Russells, camlets, and many others, both for dress and furniture. Mousseline de laine was, as its name implies, originally all wool, but it is now more generally mixed with cotton, and printed.

The second class includes two fabrics, of which the consumption for female dresses has been immense—viz., Coburg and Orleans cloths, the former being twilled, and the latter plain. Many of the names used in the all-wool class are retained in this, with the addition of the word 'union,' as union merino, union shalloon, union damask, &c. Winceys, now so popular for ladies' winter dresses, on account of their warmth, are made of wool and cotton, from yarns of a heavier and coarser kind than those used for cloths like Coburgs. Winceys are largely made at Aberdeen, Perth, Glasgow, and other places in Scotland, as well as in Yorkshire.

The third class includes the rich Poplins (q. v.) and Tabinets (q. v.), made chiefly in Dublin, and giving employment there to about 1200 hands. Paramatta or Henrietta cloth, Canton cloth, and others, are made both of silk and wool, and cotton and wool. Some Coburgs, Orleans, Russells, and Damasks are likewise made with silk warps.

The fourth class—viz., mixed goods, in which silk, wool, cotton, and sometimes linen are used—includes peculiar kinds of some of the fabrics named above, and also vestings, linings, cravats, shawls, scarfs, quiltings, boot and shoe cloths, barèges, &c.

The fifth class includes alpaca lustras and mixtures—plain, twilled, and figured; alpaca poplins, umbrella and parasol cloth; mohair lustras, glacés, Verona serges, barèges, &c.

The term 'worsted' is said to have derived its origin from a village of that name in Norfolk, where this manufacture was first carried on. Up to the end of last century, worsted goods were a staple trade of Norwich; but the neglect of the factory system there led to its being transferred to Bradford, which has become renowned as the metropolis of the worsted manufacture. It is also extensively carried on at Halifax and other places in Yorkshire.

Like the woollen, some of the statistics of the worsted manufacture are not more recent than 1861, to which year the first two tables apply:

NUMBER OF OPERATIVES OF BOTH SEXES EMPLOYED.

| | England and Wales. | Scotland. | Ireland. | United Kingdom. |
|-------------------|--------------------|-----------|----------|-----------------|
| Males—under 13, | 6,268 | | | 6,268 |
| " 13 to 15, | 6,434 | 178 | 12 | 6,614 |
| " above 15, | 17,700 | 895 | 24 | 18,619 |
| Total, . . . | 30,392 | 1,073 | 36 | 31,501 |
| Females—under 13, | 6,906 | 4 | | 6,910 |
| " above 13, . | 45,674 | 1,839 | 139 | 47,653 |
| Total, . . . | 52,580 | 1,843 | 139 | 54,562 |
| Total, . . . | 82,972 | 2,916 | 175 | 86,063 |

Nearly 90 per cent. of all the operatives engaged in the worsted industry were employed in the Yorkshire factories. In 1866, the average rate of wages earned by them were, at Bradford: *Spinners*—Women, 7s. to 10s. per week of 55 hours: *Weavers*—Men, 18s. per week of 60 hours; women, 12s. per week of 55 hours. At Halifax: *Spinners*—Men, 30s. per week of 60 hours; women, 7s. 6d. to 8s. 6d.: *Weavers*—Men, 16s. to 24s.; women, 8s. to 12s. The importations of worsted yarns being included along with woollen in the returns, cannot be given separately (see page 286). In 1865, the imports of worsted stuffs amounted to 154,000 pieces, valued at £334,000, and came chiefly from France.

With respect to the exports, the following will show the vast increase which has taken place from 1860 to 1865: 1860—Worsted yarn, 26,455,000 lbs. (£3,578,000); worsted stuffs, 148,685,000 yards (£7,013,000). 1865—Worsted yarn, 30,221,000 lbs. (£5,074,000); worsted stuffs, 233,078,000 yards (£13,361,000). A very large trade has been carried on in these goods with France since the conclusion of the commercial treaty with that country a few years ago. In 1865, it amounted in value to £1,332,000.

The rapid increase of the worsted manufacture as compared with the woollen, is no doubt to be ascribed to the greater simplicity of the processes, to the recent introduction of combing-machines, but most of all to the introduction of cotton-warps in 1835, which not only cheapened the goods, but vastly increased their variety.

Information regarding such special branches of the woollen and worsted industries as carpets, shawls, hosiery, tartans, bonnets, &c. will be found under their separate heads. We may state here that the Scotch bonnet-trade, carried on at Kilmarnock and Stewarston, employs from 2000 to 3000 hands, and sends out about 500,000 bonnets annually.

WOOLLETT, WILLIAM, one of the most eminent of English engravers, was born in the year 1735 at Maidstone. He went early to London; studied his art under a practitioner of the name of Tinney, now only remembered as having taught him little or nothing; taught himself, however, a good deal, notwithstanding the aid of Tinney, and developing a manner of his own, soon became known as one of the most accomplished engravers of his time. In recognition of his merit, he was ere long appointed engraver to George III. As to his life, except as he is proved to have existed by his works, familiar at this day to every one, nothing is known. He died in London, in the year 1785, after a life of continuous and conscientious labour, as reward of which, a monument was erected to him in Westminster Abbey. His works, more especially in landscape, continue to be much prized by connoisseurs.

WOOLSACK, the name given to the seat of the Lord Chancellor of England in the House of Lords,

NUMBER AND SIZE OF FACTORIES.

| Divisions. | Number of Factories. | Number of Spindles. | Number of Power-looms. |
|-------------------------|----------------------|---------------------|------------------------|
| England and Wales— | | | |
| Yorkshire, . . . | 443 | 1,149,072 | 40,577 |
| Other Counties, . . . | 69 | 96,484 | 2,391 |
| Total, . . . | 512 | 1,245,556 | 42,968 |
| Scotland, . . . | 17 | 38,946 | 80 |
| Ireland, . . . | 3 | 4,700 | ... |
| Total—United Kingdom, } | 532 | 1,289,172 | 43,048 |

which is composed of a large square bag of wool without either back or arms, and covered with red cloth. The woolsack was first introduced in the House of Lords as the Chancellor's seat in the time of Elizabeth, as a memento of an act which was passed against the exportation of wool, that commodity being then the main source of the national wealth of England.

WOOLSTON, THOMAS, a heterodox divine of the English Church, equally remarkable for ingenuity and learning, and for the singularity of his opinions, was born at Northampton in 1689. He was educated at Sidney Sussex College, Cambridge; was elected a Fellow of his college; entered into holy orders, and in due course proceeded to the degree of Bachelor of Divinity. Gifted with a lively fancy, he became a diligent and appreciative student of the works of Origen, and by them seems to have been first imbued with a taste for the allegorical interpretation of the Scriptures. That he was disposed to carry this principle of interpretation much too far for his contemporaries, appeared at once from his first work, published in 1705. This was, *The Old Apology for the Truth of the Christian Religion against the Jews and Gentiles revived*. In this work, W. maintained that Moses was only an allegorical person, and all his history typical of that of Christ; that the miracles of the Pentateuch were allegorical, and the miracles attributed to Christ and the apostles pure allegory too; and he stigmatised as atheists and apostates all who received the Scripture narratives as literally, historically true. In subsequent publications, he went further in the same direction; also maintaining that the Quakers approached more nearly in doctrine and organisation to the primitive church than any other religious body; and denouncing clergymen, because they made a profession of the pastorate, as 'hireling priests,' worshippers of the Beast, and ministers of Antichrist. In 1721, he published *The Moderator between the Infidel and the Apostate*, dialogues tending to shew that the gospel miracles, by themselves, could not prove Christ to be the Messiah. This work occasioned great scandal: it abounded in expressions considered indecent and blasphemous; and it was only through the intervention of Whiston, who was friendly to him, and in favour of toleration in matters of opinion, that the author escaped a prosecution. Up to 1720, W. had continued to live in his college, leading a studious and blameless life, and shewing great kindness to the poor. In 1720, he went to live in London; and in 1721, his college, upon some pretext—really on account of the scandal made by his writings—deprived him of his Fellowship. The views set forth in the last-mentioned work, W. developed more fully in a series of six discourses during the years 1727, 1728, 1729, republished under the title *Discourses on the Miracles of Christ*. He maintained—representing himself, as in all his works, as the defender of true Christian doctrine—that Christ's miracles, in themselves, were open to the gravest doubts; that, in fact, the gospel narratives, if they were to be taken literally, were only a tissue of absurdities; and that the authority of the ancient church was against the literal, and in favour of an allegorical acceptance of them. These views were supported with a good deal of warmth, and mixed up with them were fierce denunciations of the order of clergy. The free-thinkers, both in England and on the continent, were now triumphantly quoting W. in their favour; and people who had previously been disposed to treat him as a maniac, whose rhapsodies were too wild to call for refutation, began to think it time to rescue the Christian faith from so dangerous and dubious a defender. No less than sixty answers were made to

the *Discourses*. Now, too—Whiston no longer intervening—an indictment, at the instance of the Attorney-general, was brought against W., on account of the blasphemous and irreligious character attributed to his works. He was tried before Chief-justice Raymond at Guildhall, found guilty, and sentenced to be imprisoned for a year, and to pay a fine of £100, and ordered to find securities to the amount of £2000 that he would not repeat his offence. He was imprisoned in the Queen's Bench Prison; and being unable to pay the fine, and both unable and unwilling to provide the requisite securities, the remainder of his life was spent within the rules of the prison. It was not long protracted. He died on the 27th January 1731. His death-bed scene has often been described as if it supported the supposition that W. was insane, but surely without good reason. It is stated that as he felt death approaching, he closed his eyes with his own fingers, saying to the turnkey who attended him, that he desired to die decently; and his last words were: 'This is a struggle which all men must go through, and which I bear not only patiently, but willingly.' His body was interred in the churchyard of St George's, Southwark.

WOOLWICH, a market-town and parish of Kent, the seat of the chief government arsenal of Great Britain, stands on the south bank of the Thames, about nine miles east of London. It stretches along the bank of the river for two miles, and reaches back from the river for half-a-mile, as far as the brow of the hill, where are the Royal Artillery Barracks and Hospital. The general appearance of the town has little to recommend it; but the southern suburbs are handsome and regular. There are numerous places of worship—established, Roman Catholic, and dissenting, and there are numerous schools, a theatre, &c. Its dockyard, its government manufacturing establishments for the production of matériel of war of every description (except gunpowder), and the fact that it is a great dépôt for naval and military stores, and also the headquarters of the great corps of Royal Artillery, combine to render W. a place of great importance. A royal dockyard existed here as early as 1515, and the *Henry Grace de Dieu*, which conveyed Henry VIII. to the Field of the Cloth of Gold, is said to have been built here, though this statement has been disputed. The *Royal George* (q. v.) was built here in 1751; and latterly, some of the largest ships in the navy have been launched from it. The yard comprises large dry docks, and a basin 400 feet long by 300 feet wide, and is furnished in every respect with the newest and most efficient apparatus. The Royal Arsenal, the largest in Britain, contains not only the largest stores of all kinds—shot, shells, cannon, &c.—which are required for our armies, navies, and forts, but it comprises also establishments for manufacturing them, and for constructing gun-carriages and preparing ammunition for cannon and small-arms. These works are carried on in the three departments called respectively the Gun Factories, Carriage Department, and Laboratory. On the common south of the town is the Royal Military Academy, for the education of cadets destined for the Artillery and Engineers. Pop. of parish (1861) 41,695.

WOONSOCKET, a township of Rhode Island, U. S., on both sides of the Blackstone River, 16 miles north-by-west of Providence, on Providence and Worcester Railway, containing a central and several smaller villages, 20 cotton-mills, 5 woollen-mills, 8 machine-shops, iron-foundries, sash, blind, and planing mills, factories of thread, silk, gold pencil-cases, jewellery, musical instruments, tin-ware, marble works, &c., 7 churches, high school,

2 newspapers, and numerous handsome residences. Pop. about 8000.

WOORALI POISON. Since the publication of the article *CURARI*, which is one of the synonyms of this substance, the physiological action of this fearful poison has been carefully studied by Drs Weir Mitchell and Hammond of the United States; and the Essay in which their joint labours are recorded is published in Hammond's *Physiological Memoirs* (1863). This Essay is so valuable, and contains so much original matter regarding two other allied poisons whose native names are *Corroval* and *Vao*, that we shall give a brief abstract of its contents; premising that, for the best account of the history of this remarkable poison, the reader should consult Bernard's *Leçons sur les Effets des Substances Toxicques* (1857, p. 238). We shall notice the physical and chemical properties of this poison before describing its physiological action. The best of the earlier investigations of the poison is that of Roulin and Boussingault in 1828, who obtained from the crude 'woorali' an alcoholic extract, to which they gave the name of *curarin*. This curarin was a solid transparent mass, of an excessively bitter taste, and possessed in an eminent degree of all the virulence of the woorali. Heintz has subsequently examined the precipitate which tannic acid throws down from the watery solution of the

Woorali or Curari Plant (*Strychnos toxifera*).

poison, but only found that it contained no nitrogen, and was composed of apparently inert substances, as sugar, gum, resin, extractive matter, tannic and gallic acids, &c. He sought in vain for strychnine in it. Amongst the chief experimenters on the subject may be mentioned De la Condamine (*Mem. de l'Académie des Sciences*, 1745, t. 62, p. 391); Brocklesby (*Philosophical Transactions*, 1747, vol. xlv. p. 408); Herissant (*Philosophical Transactions*, 1751—1752, vol. xlvii. p. 75), who killed a bear with a poisoned arrow in less than five minutes; and nearly killed himself and a small boy who was evaporating an aqueous solution of the poison; both, however, recovered under the influence of fresh air, a pint of wine, and a quantity of sugar; Fontana (1781), who shewed that (notwithstanding the above experiment) the vapour is not deleterious, and that the state of the stomach at the time when the poison was inhaled modified the result, an animal with a full stomach being able to resist the action of a dose that would prove fatal to one of the same size when fasting; Brodie (*Philosophical Transactions*, 1811—1812); Virchow and Münter (published in vol. i. of Schomburgk's *Reisen in Britisch Guiana*), who, inter-

alia, shewed that the poison, even after being kept dry for five years, is still intensely active—that its physiological action corresponds with the result of analysis in shewing the absence of strychnine, and that it rather belongs to narcotic than to tetanic poisons—and that death takes place not from any direct result of the poison, but indirectly, by causing the cessation of the respiratory process; Bernard and Pelouze (*Compt. Rend.*, 1850, t. xxxi. p. 534); Vulpian (*Compt. Rend.*, 1854, t. i., 2d series, p. 73); and Kölliker (*Proceedings of the Royal Society*, 1857), who, amongst other important conclusions, arrives at the following: (1) That the *urari* (as he terms it) causes death very rapidly when injected into the blood or inserted into a wound; and that when introduced by way of the mucous membrane, its effects are slow, and require a large dose for their production; when applied to the skin of frogs, it is inoperative—(2) it acts through the blood, and destroys the excitability of the motor nerves, while the sensory nerves are hardly at all affected—(3) when artificial respiration is carried on in animals under its influence, many of the secretions are increased, owing to the paralysis of the vascular nerves, and the consequent dilatation of the vessels—(4) that in mammals, the poison causes death by the paralysis of the respiratory nerves and suppression of the respiration, which brings on convulsions as a collateral effect.

The late researches of Weir Mitchell and Hammond on the two hitherto undescribed varieties of the poison, named *Woorara*, variety *Corroval*, and *Woorara*, variety *Vao*, lead to the following results. The *corroval*, which is asserted to be the strongest arrow-poison, but of whose mode of manufacture they could learn nothing, was in large lumps of a brownish black colour, resembling vegetable extracts of that tint. From its aqueous solution they obtained a substance possessing all the qualities of an alkaloid, and in an eminent degree the poisonous properties of the *corroval*, to which they assign the name *Corrovalia*. Hence it differs materially in its chemical composition from ordinary woorali. From a large number of experiments on living birds, mice, cats, frogs, and alligators, they find (1) that *corroval* differs essentially from any variety of woorali hitherto described in its physiological results; (2) that it acts primarily on the heart through the medium of the blood, producing an arrest of the heart's action; (3) that the annihilation of voluntary and reflex movements is a secondary result of its action, depending primarily on the cessation of the heart's action; (4) that it acts upon the nerves from the surface to the centre, and abolishes both the sensory and motor functions; (5) that it destroys muscular irritability; (6) that it paralyzes the sympathetic nerve, this being one of its primary effects; (7) that it is absorbed both from the intestinal canal and skin of frogs; and (8) that its poisonous effects are due to an alkaloid hitherto undescribed. The authors devote 42 pages to a history of their experiments on *Vao* or *Bao*; but as they are of opinion that *vao* is only a weaker variety of *corroval*, it is unnecessary to follow their researches in this direction. It is obvious that in *corroval* and *vao* we have a fearful poison, quite distinct from ordinary woorali; and we have entered into further detail on this subject than we should otherwise have done, because, so far as we know, they have not yet been noticed by any English author.

WOOTZ is a finely damasked hard cast steel, which is obtained from India. Faraday found aluminium in a sample which he analysed, and referred its peculiar properties to the presence of this metal; but other chemists have failed in finding aluminium in wootz.

WORCESTERSHIRE, one of the west-midland counties of England. The conterminous counties are those of Warwick and Stafford on the N., Warwick and Oxford on the E., Gloucester on the S., and Hereford and Salop on the W. Area, 472,165 acres, whereof about 400,000 are cultivated. Its greatest length is 38 miles, and greatest breadth, 26. The surface is undulating, and there are depressed valleys and hilly ranges; two of the latter are of considerable extent, and adorn its eastern and western sides. On the west, the range terminates in the Malvern Hills, the highest point of which is the Worcester-shire Beacon, about 1100 feet above the level of the sea. Its name is derived from its shape, a cone towering beacon-like above the lesser eminences of the chain; but the highest peak of the range is named the Herefordshire Beacon, which is slightly more elevated than the other Beacon, and stands in the county of Hereford. The eastern range is the Bredon Hills, which form part of a chain extending from Bromsgrove Lickey, near Birmingham, to the Cotswold Hills, beyond Gloucester. The county is well watered, and finely timbered, especially with fruit-trees. The elm grows very luxuriantly, and indeed is so common in every corner as to have obtained the name of 'the weed of Worcestershire.' The oak, beech, and other timber trees thrive well, and of late the larch has been much planted. The principal rivers are the Severn, the Teme, and the Avon. Other streams there are, such as the Stour, the Salwarp, &c., but except in flood-times, these are mere brooks, and scarcely deserve the name of river. The Severn is navigable from the sea at Gloucester as high up as Shrewsbury; but from an intermediate place called Stourport, 14 miles above Worcester, the navigation is uncertain, except for barges of very light draught. There are three canals communicating with the Severn—viz. the Staffordshire and Worcestershire at Stourport; the Droitwich, a little way above Worcester; and the Birmingham and Worcester, in the immediate neighbourhood of the city. The W. portion of the Vale of Severn is about 30 miles long; the climate is mild and healthy; but the rainfall is comparatively small, and nearly the minimum of England. The soil consists of almost every variety suitable for vegetation, from strong deep clay and rich vegetable mould, to light friable sandy ryeland, with tracts of alluvial deposit, marl, and loam. The Vale of Evesham is dependent on the Avon for its fertility, which has long gained for it the reputation of being the garden of the mid-west. It produces abundance of table-fruit, and vegetables of the finest quality, and the rental of its kitchen-garden ground is nowhere excelled by cultivated land anywhere, unless in the immediate neighbourhood of London. The agriculture of W. has been greatly improved during these last twenty-five years, and high farming is now much in vogue. Excellent crops of wheat and other grains, turnips, and potatoes are raised; a large portion of the land remains in the form of meadow, and much of it ancient pasture.

Hop-gardens are plentiful in the western division of the county, and their produce ranks, in the estimation of brewers, next to that of East Kent. W. is *par excellence* a perry county, as Herefordshire and Devonshire are cider counties. Its pear orchards are very beautiful in the time of blossom; and there is a splendid variety, called the 'black pear of Worcester,' which attains a great size, and is supposed to be the traditional pear blazoned on the county's shield of arms.

There is no distinctive local breed of stock, either cattle or sheep. The cattle most thought of are Herefords and Shorthorns; and among sheep, the

favourite varieties are Shropshire Downs, Leicesters, Cotswolds, and cross-breeds. Pigs are abundantly bred and fed. The markets are well supplied with butcher-meat, bred and fed in the county; and London, Birmingham, and the 'Black Country' draw large supplies from Worcestershire. Poultry are raised in considerable quantity, and the W. farmers' wives have deservedly obtained a good name for the condition and neatness in which they are sent to market. The county possesses great mineral wealth in coal, iron, salt, lime: the first three are found in the north-eastern quarter of W., but lime is very generally distributed. In 1861, the pop. was 307,397; in 1867, it is estimated at 325,000. Coal and iron mines are largely worked in the neighbourhood of the populous borough of Dudley. Iron-works abound between it and Stourbridge, where glass manufactures of an ornamental character, on a large scale, have taken root; and there are abundance of coal-mines in the neighbourhood.

The textile fabric manufactures are nearly confined to carpet-weaving, which has long been carried on successfully at Kidderminster; and at present (1867), this branch of industry having suffered a transition from the hand-loom stage to power-working, has just emerged from the usual uncertainty which attends all manufactures submitted to that trial, and appears to be thriving with a vigour commensurate to the enlarged capability of its new powers. At Redditch, the needle and fish-hook manufacture is carried on to a greater extent than in any other place in England; nail-making has been practised for centuries at Bromsgrove; and at Droitwich, about six miles from Worcester, salt has been manufactured from an inexhaustible supply of brine for many centuries. The specific gravity of the Droitwich brine is considerable, and the supply seems inexhaustible. Of the pop., about 100,000 are connected with mines and manufactures, and the remainder are engaged in agriculture, or dependent on trade. W. possesses a county regiment of militia, consisting of 850 officers and privates; also the Queen's Own Regiment of Worcestershire Yeomanry Cavalry, 726 sabres; and the Worcestershire Regiment of Rifle Volunteers, comprising two battalions, each 800 strong. The county sends four knights of the shire to parliament, and six members for the boroughs of Evesham, Kidderminster, Droitwich, Dudley, Bewdley (and Stourport united), besides two for the city—making a total of twelve members from Worcestershire.

WORCESTER, a city, capital town of the county of the same name, and a county of itself, stands almost in the centre of the Severn Valley, and is situated principally on the eastern bank of the river, about 26 miles south-west from Birmingham. W. is of great antiquity; there are abundant traces of ancient iron-smelting works on the banks of the river, adjudged by antiquaries to belong to the times of the Roman occupation; and the discovery of other remains at intervals, proves that the city was a Roman station. The chief object of antiquity now existing is the cathedral, which is beautifully placed on a gentle elevation on the west bank of the river, and stands within its own precinct, but which, since the passing of the act abolishing the isolation of 'peculiar' and 'non-parochial places,' has been incorporated in the city parish of St Michael. A cathedral, dedicated to St Peter, was founded here as early as the 7th c.; but in 983, St Oswald built the church and monastery of St Mary, near the cathedral of St Peter. In 1084, Bishop Wulstan laid the foundation of a new cathedral, many portions of

which remain in the present structure, such as the crypt (one of the oldest and most interesting in England), the bases of and fragments in many of the walls, chapter-house, refectory, and cloisters. In the Civil Wars, much damage was done to the building, but none of its leading features were destroyed. It is now distinguished by the simplicity, if not plainness, of the exterior, but which is amply compensated by the fine perspective, the lofty roof, and generally charming effect of the interior. A thorough restoration, now approaching completion, was commenced some years ago, at an estimated cost of not less than £60,000 when completed. The Episcopal Palace in the city has been transformed into the Deanery; and the Bishop of W., since the ecclesiastical commissioners assumed the management of the episcopal and caputular estates, has his residence at Hartlebury Castle. The Bishop of W.'s revenue has been fixed by the ecclesiastical commissioners at £5000; and the livings in his gift are numerous, and of considerable value. Worcester chapter consists of the dean, 4 canons, 24 honorary canons, and 4 minor canons, including the precentor. Besides 10 chorister boys, there are 40 other boys on the foundation at the College or Cathedral School, who receive gratuitous education, and are paid £2, 13s. 4d. a year. There are six teachers in the school—three of whom are on the foundation, and three are paid by the head-master out of the fees received by him from the non-foundation boys, of whom he may receive as many as present themselves. Altogether, the College School at present is attended by more than 100 scholars; and the branches taught include the elements of a classical and commercial education. The parish churches of the city are poor specimens of architecture. The city does not shine in public buildings; and probably, next to the cathedral, the most important and appropriate in construction is the county prison. The pop. of the city and its suburbs, without reference to the census divisions into union and non-union districts, was, in 1861, about 32,000, and is now estimated to be 36,000. The people are employed in glove-making, including leather-dressing and staining; in porcelain factories; iron-works, including locomotive-engine factories; tanning and currying, horse-hair weaving, vinegar, British wine and sauce making, and coach-building. Chemical manures and agricultural implements are also manufactured on a considerable scale. Glove-making is still considered the staple manufacture of the city; but one large factory has absorbed a large portion of the business, and now there are not above two dozen of master-tradesmen in the glove-way, great and little, whereas 40 years ago there were nearly 100 in the trade. The porcelain factories are two, and the number of hands employed by them in all departments is about 400. The Royal Porcelain Works are celebrated for fine taste in designing and the beauty of execution of the highest class of productions; while the speciality of the other factory, Messrs Grainger & Co.'s, is utility, combined with purity of design and excellence in workmanship. They are celebrated for their semi-porcelain, which is so excellently glazed as to resist the strongest acids. The city sends two members to parliament, and is governed by a corporation consisting of a mayor, sheriff, 12 aldermen, and 36 town-councillors.

WORCESTER, a city of Massachusetts, U. S., the centre of a fine agricultural district, 45 miles west-south-west of Boston, with six diverging railways, in a valley surrounded by beautiful hills, with delightful sites for residences, broad shaded streets, and famed for its political and philanthropical conventions. Among its institutions

are, the American Antiquarian Society, with a library of 12,000 volumes, and cabinet; the State Lunatic Asylum, which, in 13 years, out of 2306 patients, discharged 1000 cured; Oread Institute, for young ladies; high, grammar, intermediate, and primary schools, considered the model-schools of New England; also, manufactories of cotton, woolen, carpets, hollow-ware, pistols, wire, paper, saddles, locks, musical instruments, &c. There are 19 churches, 12 periodicals, 3 daily. Pop. (1860) 24,960.

WORCESTER COLLEGE, OXFORD, was founded, like Trinity and St John's, on the site of an old monastic college. The ancient institution was known by the name of Gloucester College, because it belonged to the Benedictine Monks of that city. After the dissolution of the monasteries, it passed through various hands; and latterly, was a Hall attached to St John's College. In 1701, however, Sir Thomas Cookes left £10,000 for the purpose of endowing some existing College or Hall. This bequest led to the erection of Gloucester Hall into a College, for a provost, six fellows, and six scholars, by letters-patent of Queen Anne, 1714. Various fellowships and scholarships were afterwards added, until the number of fellows became 21, of scholars 16, but almost all restricted to certain counties, or to founders' kin. The Commissioners under 17 and 18 Vict. c. 81 reduced the number of fellowships to 15, open without restriction, except that candidates for a fellowship on the Eaton foundation must be sons of clergymen of the Church of England and Ireland, and must not be possessed of property or income exceeding £150 a year. The scholarships are now 15 in number—six on the foundation of Sir Thomas Cookes, for persons educated at Bromsgrove School; one on the foundation of Dr Finney, for natives of Staffordshire; five on the foundation of Mrs Sarah Eaton, for sons of clergymen of the Church of England and Ireland; and three on the foundation of Dr Clarke, which are entirely open. The Cookes' scholarships are tenable for six years, the others for 24 terms. The scholarships are said to be of the value of £70 per annum. There are also some exhibitions—four on the foundation of Sir Thomas Cookes, value £42 a year, for persons educated at Bromsgrove School. There are nine benefices in the gift of this College.

WORD, in time of peace, a signal notified in the orders of the day, in virtue of a knowledge of which a sentry will allow the utterer to pass. In the field, the officer commanding fixes daily upon a word and countersign (for which any arbitrary terms are taken), and communicates them to the sentries on guard, and to such other persons only as he may choose to permit to pass through the lines. Any person then approaching a sentry without knowing the word, has a fair chance of being shot; if he knows not the countersign, the sentry will take him into custody, and deliver him to the officer of the guard. Care has to be taken that the 'word' should not suggest the 'countersign.' Any arbitrary combination is therefore adopted.

WORDSWORTH, WILLIAM, a distinguished English poet, was born on the 7th April 1770, at Cocker-mouth, in Cumberland. He was the second son of John Wordsworth, attorney, and agent on the estates of the first Earl of Lonsdale. He was sent to school at Penrith, where his parents had gone to reside; and after the death of his mother in 1778, was transferred to Hawkshead, in Lancashire, at the public school of which his earlier education was completed. In 1783, his father died, leaving his family in some difficulty. By Lord Lonsdale, a considerable sum was due to them; but his Lordship, a man of most eccentric character, saw fit to

resist the claim, with all the vexatious impediments which the law so plentifully affords. Enough, however, remained, with some little assistance from relatives, to carry forward the education of the children. W. remained at Hawkshead till 1787, in which year he was entered at St John's College, Cambridge. Here he remained four years. In the studies proper to the place, his interest was slight; but in his own fashion he was a diligent student; and poetry became more and more his favourite pursuit. In January 1791, he left Cambridge, after taking his degree as Bachelor. During the autumn of the previous year, he had, along with a fellow-student, made a pedestrian tour through France, then in the early fervours of its great Revolution; and thither, after leaving college, he returned. His sympathy with the aims of the Revolution was passionate; and with the party of the Gironde he seems to have cultivated relations of a somewhat intimate kind, which, in the end, might have seriously compromised him, had not circumstances, probably of the pecuniary sort, determined his return to England some little time before his friends were sent in a body to the scaffold. The republican principles which at this time he held, he lived to renounce in favour of a reasoned conservatism; and opposed as he was, in its earlier stages, to the war waged against France, no one more patriotically urged it, when the struggle became in effect a life and death grapple on the part of England with the military despotism of Napoleon.

In 1793, W. came before the public as an author, in two poems, entitled *An Evening Walk*, addressed to a *Young Lady*; and *Descriptive Sketches*, taken during a *Pedestrian Tour among the Alps*. These pieces abound in touches of refined and original observation of nature, but otherwise are not in themselves specially remarkable; and they failed to make any impression, except on a few minds, such as that of Coleridge, then at Cambridge, who afterwards professed to have discerned in them the seeds of a great undeveloped genius. W. was now in a position of much perplexity; his little finances were almost entirely exhausted: for the church, which his friends would fain have had him enter, he had at this time an obstinate aversion; poetry had become with him a passion, to which he longed to wholly dedicate himself; and unhappily it appeared that his poetry would not in the least pay. As a poet cannot live like a singing-bird by pecking about the hedgerows, it became necessary for him to bethink himself of some means of support; and he was on the point of proceeding to London, to do liberal politics for the newspapers, when unexpected relief came to him in the shape of a legacy. The name of Raisley Calvert deserves to be remembered with that of Wordsworth. An intimate friend of the poet, he had formed a high opinion of his genius; and at his early death in 1795, he was found to have bequeathed to W. the sum of £900, expressly that leisure might for some years be allowed for the undisturbed development of his powers. Seldom has money been better bestowed; and small as the sum may seem, to a man of the poet's simple tastes and entire singleness of aim, it could suffice over a term of years. With his only sister, Dorothy, his attached companion through life, and always a devout believer in the brother, no little of whose genius she shared, he now settled himself at Racedown Lodge, in Dorsetshire, removing in 1797 to Alfoxden, in Somersetshire, in order to be near Coleridge, who had established himself some three miles off at Nether-Stowey. Out of the intimacy thus begun, came the famous *Lyrical Ballads*, published in 1798 by Cottle of Bristol, as a joint adventure of the two poets. The volume had

no success; but probably no man ever lived more serenely self-appreciative than W.; and he did not allow himself to be disheartened by the neglect meantime of the world. After a short tour in Germany, along with his sister and friend, he returned to his native Cumberland, which he never again permanently left. He settled himself first at Grasmere; in 1808, he removed to Allan Bank, in the vicinity; and in 1813, he transferred his household to Rydal Mount, the place which, of all others, remains specially associated with his memory. On the death of the old Lord Lonsdale, the justice of the claim of the Wordsworths against the estates was admitted; and in 1802, a sum of about £8000 was by his successor made over to the family. To W. and his sister, their moiety of the money may have been acceptable, as by this time, one should say, they must needs have been seeing pretty nigh to the end of Raisley Calvert's convenient £900. Henceforth, a modest competence was secure to them; and W. was wedded within the year to Mary Hutchinson, a cousin of his own, with whom he had been intimate from his childhood. In 1813, by the kindness of Lord Lonsdale, he was appointed Distributor of Stamps for the county of Westmoreland, a situation which brought him, without much to do for it, a salary of £500 a year. When, the year after, he published his great poem, *The Excursion*, he dedicated it to Lord Lonsdale, in a sonnet, expressive of 'high respect and gratitude sincere' for this comfortable increase to an income sufficient, perhaps, but certainly not excessive, for a man who had now a family growing up round him. Meantime, and pending the appearance of this elaborate work, the reputation of the poet had been surely, if slowly rising. In 1800, he had published, in two volumes, a second edition of the *Lyrical Ballads*, disjoining his own from those of Coleridge, and adding a quantity of new matter; and in 1802 and 1805, further editions had been issued. To these succeeded, in 1807, a new collection, under the title of *Poems, in Two Volumes*. In these earlier writings, there was a good deal which almost wilfully seemed to invite ridicule; and for a good while, W. was merely the laughing-stock of reviewers, more particularly of Jeffrey, who, as editor of the great *Edinburgh*, at this time figured as chief Aristarchus of the day. The more to popularise the ridicule, a nickname was invented; and 'the Lake School,' as it was called, which, with W., included Coleridge and Southey, who chanced to reside in the same district, passed current as an easy name of scorn. It could not be long concealed, however, that these volumes of W., despite an occasional eccentricity in the choice of mean and impracticable subjects, contained a large body of true poetry of a singularly fresh and original kind. A select circle of passionate admirers, including men like Leigh Hunt, De Quincey, and Wilson, eagerly pressed the true claims of the poet; and after the publication of the *Excursion*, a volume of high and serious verse, gravely defective in plan, and at times heavy and tedious, but with little or no trace in it of the earlier oddities of the writer, it came more and more to be felt that the laughers were getting the worst of it, and that W., however he might now and then indulge himself in whimsical tricks, was really a man of true and lofty genius, against whom ridicule could not permanently avail. Their occupation was not yet, indeed, quite gone; and the subsequent appearance, in 1819, of *Peter Bell*, a poem not without profound merits, but unhappily with a donkey for the hero of it, allowed them to resume their advantage a little. But, on the whole, the day of idle jeer was over; the tide of genuine

appreciation had set in, and it continued to flow steadily, till, long before his death, W. found himself recognised almost *nem. con.* as at the head of the poetical literature of his country. His later days were passed serenely in honour. In 1839, the university of Oxford conferred on him its honorary degree of D.C.L. In 1842, a pension of £300 per annum was assigned him by government; on receipt of which he ceded, in favour of his son, his situation as Distributor of Stamps; and on the death of his friend Southey, in 1843, he succeeded to the vacant laureateship. On the 23d April 1850, he peacefully closed a life so pure, serene, and priest-like in its consecration to a lofty purpose, that we must go back to Milton in order to find its parallel. It remains only to enumerate the publications of W. not included above. In 1815, appeared *The White Doe of Rylstone*, which was followed by *The Waggoner*, and a series of *Sonnets on the River Duddon*. In 1822, he published a volume entitled *Memoirs of a Tour on the Continent*; some years after, his *Ecclesiastical Sonnets*; and in 1835, *Yarrow Revisited, and Other Poems*, the fruit of a tour to Scotland, memorable by his mournful parting, at Abbotsford, with the dying Scott, which he records in a beautiful sonnet. In 1842, he issued a collected edition of his works, rearranged as we now have them, in a somewhat fanciful fashion of his own. Shortly after his death, a long autobiographical poem, in blank verse, was published, entitled *The Prelude*.

By remanding it to truth and simplicity of natural feeling as its basis, W. did more than perhaps any other writer of his time to forward the great revival of English poetry which distinguished the opening of the century. But he was scarcely the originator of the movement; the new influence was, so to speak, 'in the air;' already Cowper in England, as in Scotland Burns, had preluded to the melodious outburst which was to follow; and to the last of these more particularly, as his early guide and exemplar, W. has expressly recorded his obligations in a stanza which, so far as we are aware, has hitherto escaped quotation:

'I mourned with thousands, but as one
More deeply grieved, for he was gone
Whose light I hailed when first it shone,
And shewed my youth
How verse may build a princely throne
On humble truth.'

With the charm of natural simplicity of manner, common to him with these his predecessors, W., however, combined a depth of philosophic meditation peculiarly his own; there was born with him, moreover, a passionate susceptibility to effects of beauty in the material world, such as few men can ever have been gifted with; and out of these blended elements arose that mystical communion with Nature which pervades the whole body of his poetry, and constitutes its truest claim to originality. By diffusion of this, and otherwise, his influence on our subsequent poetry has perhaps been as profound as any of the kind ever exercised, and it has been almost wholly beneficial. Yet we need not admire all we find in him. The early ridicule directed against him, though it sinned by excess and disproportion, was really to a great extent deserved. Had he gone on writing nothing but the 'Betty Foy's' and 'Alice Fells' which Jeffrey laughed at, we should not have had in this place to do a biography of him. It is despite of a good deal of this kind of perverse drivel, besides indifferent matter otherwise, and not in the least because of it, that he continues, and must long continue, to be remembered.—See *Memoirs of*

William Wordsworth, by Christ. Wordsworth, D.D.

WORK. To do work is to overcome resistance. If we try to lift a ton-weight, however we may fatigue ourselves, we cannot move it, and therefore we do no work. But we can lift with ease a hundred-weight, and then we do more work in proportion as we raise it higher. In lifting coals from a pit, the work done is evidently in proportion to the depth of the pit, and to the weight of the coals raised. This and numberless other instances are too well known to need further description. We may therefore at once define the *work done by a force* as the *product of the force into the space through which it moves its point of application in its own direction*, and it is usually measured by engineers and others who do not require absolute accuracy, in *foot-pounds*, the work required to raise a pound one foot high. If the motion of the point of application be in the *opposite* direction to that of the force, the work is done against the force. If the motion be perpendicular to the direction of the force, no work is done by or against the force. Thus, the work spent in projecting a curling-stone, in opening a massive gate, or in turning a large fly-wheel or grind-stone, has nothing whatever to do with the force of gravity—the body moved, in all these cases, is, as a whole, neither raised nor lowered as regards its distance above the earth's surface. If the direction of the force be oblique to the direction in which the point of application moves, we must resolve the force, by the law of the Parallelogram of Forces (see COMPOSITION OF FORCES), into two components, one in the direction of motion, the other perpendicular to it. The former is the working component; the latter, as we have just seen, does no work. A good illustration of this is found in the case of raising stones from a quarry by carting them up a series of inclined planes, as contrasted with hauling them up vertically. The work done in either case is measured by the product of the weight of the stones, and the height through which they have been raised; and thus, for the same load of stones, it will be the same whichever process is adopted. This is evident from the property of the inclined plane—viz., that the force required to support a body resting on the plane (which is the force that has to be overcome when we haul it up the plane) is to the weight of the body as the *height* of the plane to its *length*. Hence, this force, multiplied into the length of the plane, gives the same product as the whole weight into the height of the plane; and these are the two quantities of work we are comparing.

When work is done upon a body, there is always an increase of velocity, unless other forces act on the body, so that it does an equal amount of work against them. Thus, if we push a movable body, such as a cart, along a road, the velocity gradually increases, and would increase indefinitely were there no friction and no resistance of the air (forces against which work has to be done), and could we move fast enough to keep continually pushing it, however great its velocity may become. If, on the other hand, by means of a rope and pulley, we raise a stone, if once started, it will ascend uniformly, so long as we pull with a force just equal to its weight, because, then, as much work is done on the stone by the hand as it does against gravity. If we pull with a force greater than its weight, we do more work on the stone than it does against gravity, and the upward velocity increases; if with a force less than the weight, the stone has to do more work against gravity than is done on it by the rope, and its velocity upwards becomes less. The measure of the excess of work done on a body over that which

WORK.

it does against resistance is *the increase of the product of half the mass into the square of the velocity*—i. e., of what was formerly called the *Vis-viva* of the body, what is now called its *Actual*, or preferably, its *Kinetic Energy*. See FORCE. Hence, as it is evident that if a body, or system, be acted on by a set of forces which are in equilibrium, it will have no tendency to lose or to acquire velocity, its kinetic energy will remain unchanged, and therefore *as much work must be done upon it by some of the applied forces, as it does against the rest, in any displacement so slight as not to change the circumstances of the particular arrangement*. That is, when forces are in equilibrium on a body, if the body be slightly displaced, the sum of the products of each force by the effective component of the displacement of its point of application is zero—the product being positive when the force does work, negative when work is done against it. This is the celebrated principle of *Virtual Velocities*, the term virtual velocity having been, very inconveniently, applied to what we have called above the effective component of the displacement of the point of application of a force. It was often employed as the basis of the whole of Statics, and very curious attempts

have been made to give proofs of it (independent of the laws of composition of forces), especially by Lagrange. But the principle of Work, or Energy, of which that of Virtual Velocities is a mere particular case, and which is at once applicable to the whole range of Dynamical Science, is distinctly enunciated by Newton in a Scholium to his Third Law of Motion. See MOTION, LAWS OF. His words are memorable, and should be universally known—*Si aestimetur agentis actio ex ejus vi et velocitate conjunctim; et similiter resistantis reactio aestimetur conjunctim ex ejus partium singularum velocitatibus et viribus resistendi ab earum attritione, cohesione, pondere, et acceleratione oriundis; erunt actio et reactio, in omni instrumentorum usu, sibi invicem semper aequales*. Newton has defined what he means by the velocity of an agent—viz., the component of the velocity of its point of application which is in the direction of the agent. He has also shewn what is the measure of resistance arising from acceleration (see VELOCITY); so that, merely using modern terms instead of those employed by Newton, but in nowise altering the scope of the above remarkable passage, we have the following version of it: *Work done upon any system of bodies (literally, the parts of any*

| DESCRIPTION OF WORK. | Weight raised. | Velocity per Second. | Unit of Work per Second. | Length of Working Day. | Total Work in a Day. |
|---|----------------|----------------------|--------------------------|------------------------|----------------------|
| | Lbs. | Feet. | Lbs. × feet. | | Hours. |
| A man mounting an easy staircase, or an incline, without a load, his work consisting simply in moving the weight of his own body, | 143 | 0.5 | 71.5 | 8 | 2,059,200 |
| A man raising weights by means of a cord and pulley, which renders necessary the return of the cord without a load, | 39.6 | { 0.66
say 0.67 } | { 26.53
24.64 } | 6 | 578,048 |
| A man raising weights by his hands, | 44 | 0.56 | 24.64 | 6 | 832,324 |
| A man carrying a weight on his back up an easy incline, and returning without a load, | 143 | 0.18 | 18.59 | 6 | 401,544 |
| A man raising materials by a wheel-barrow, on an incline of 1 in 12, returning unloaded, | 132 | 0.065 | 8.58 | 10 | 308,880 |
| A man throwing earth by a spade a height of 5 feet 4 inches, | 5.94 | { 0.66
say 0.67 } | { 3.98 | 10 | 143,280 |
| A man working a pin-wheel or a drum—
1st, at the level of the axle, | 132 | 0.5 | 66 | 8 | 1,900,800 |
| 2d, at bottom of wheel, | 26.2 | 2.34 | 61.8 | 8 | 1,779,840 |
| A man walking and pushing, or drawing horizontally, in a continuous manner, | 26.4 | 2 | 52.8 | 8 | 1,520,640 |
| A workman acting upon a winch, | 17.6 | 2.5 | 44 | 8 | 1,267,200 |
| A workman pushing and pulling alternately in a vertical direction, | 13.2 | 2.5 | 29 | 10 | 1,044,000 |
| A horse harnessed to a carriage going at a walking pace, | 154 | 3 | 462 | 10 | 16,632,000 |
| at a trot, | 96.8 | 7.22 | 699 | 4.5 | 11,823,800 |
| A horse in a mill, at a walking pace, | 99.0 | 3 | 297 | 8 | 8,558,800 |
| at a trot, | 66.0 | 6.56 | 433 | 4.5 | 7,014,600 |
| An ox in a mill, at a walking pace, | 132 | 2 | 264 | 8 | 7,602,800 |
| Mule " | 66 | 3 | 198 | 8 | 5,702,400 |
| Donkey " | 30.8 | 2.67 | 82.24 | 8 | 2,368,512 |

machine) has its equivalent in work done against friction, molecular forces, or gravity, if there be no acceleration; but if there be acceleration, part of the work is expended in overcoming the resistance to acceleration, and the additional kinetic energy developed is equivalent to the work so spent.

When work is expended in overcoming the resistance to acceleration, i. e., the *Inertia* of a body, we have its equivalent in additional kinetic energy. When it is expended against gravity, as in raising a weight or bending a spring, we have it stored up in a dormant form as *Potential Energy*. See FORCE. When it is expended in overcoming friction, there appears at first sight to be no equivalent—but the comparatively recent researches of Joule (q. v.) and others have satisfactorily accounted for its disappearance, by proving its quantitative transformation usually into heat, sometimes into other forms of molecular energy. But to pursue this point would lead us again to questions already treated at some length in the article FORCE. There is one remark, however, which it is important to make. In

compressing a gas, in the receiver of an air-gun for instance, we can never recover as useful effect all the work expended. The reason is, that a gas is heated by compression, so that part of the work spent is converted into this heat, conducted through the metal, and by the principle of *Dissipation of Energy* lost, at least in part, to man. Had we a gas which could not be heated by compression (take the imperfect analogy of a space filled with fine spiral springs), we should recover, by allowing it to expand, all the work expended in the compression.

One other remark remains to be made. It will be noticed that Newton speaks of the action of an agent as the product of the agent and the component velocity of its point of application. This is what we now call *Rate of doing Work, or Horse-power*. Watt estimated a horse-power at 33,000 foot-pounds per minute, or 550 foot-pounds per second. This is probably too high; but it is constantly employed in engineering calculations. A curious quantity, sometimes employed as regards

steam-engines, especially those employed for pumping mines, is the *duty*, which is measured by the number of foot-pounds of work done by a hundred-weight of coals supplied to the furnace. A similar mode of comparison is now applied to steam-engines for agricultural purposes, &c.

The quantity of work which can be got out of any machine, human, animal, or other, depends in many cases on the rate at which it is done, or the horse-power actually exerted. An average man can easily work at the rate of a horse-power for a few minutes at a time; but if he were to work at no other rate, he would do very little work in a day. Various singular investigations have been made, both theoretically and experimentally, as to the most profitable rate of doing work, and their results are highly interesting. But to discuss them properly would require more space than we can afford. The table on preceding page, due to Poncelet, gives at least approximate notions of the horse-power employed, and the whole work done, in a working-day, by men and animals variously applying their exertions.

WORKHOUSE, the name given to municipal institutions, in England, in which paupers are supported and maintained. The earliest mention of them is to be found in stat. 13 and 14 Car. II. c. 12, authorising workhouses to be erected in the cities of London and Westminster, to which rogues and vagabonds might be committed, by any two members of the 'Workhouse Corporation,' a Board created by the act, with the view of restraining them from predatory habits, and compelling them to work for their living. The provisions of this act were, for the first time, carried into effect in the reign of William and Mary, when a corporation, headed by the Lord Mayor of London, fitted up a house in Bishopsgate Street as a workhouse, one part of which, called the Keeper's Side, was devoted to the purposes contemplated by the act of Charles II.—viz., the reception of vagrants and disorderly persons, committed by two governors; while, in the other part, called the Steward's Side, poor children were lodged, and taught various employments and branches of education. A very few workhouses were afterwards erected by local acts; but their general adoption throughout England was first provided for by act 9 Geo. I. c. 7, by which the churchwardens and overseers of the poor, in any parish or town, were empowered, with consent of the majority of the inhabitants, to establish a workhouse, where the poor were to be lodged and maintained. Two or more parishes might unite in having one workhouse, and one parish might contract for the maintenance of its poor in the workhouse of another. Under this statute, buildings began to be erected and hired all over the country, with great zeal for workhouses, in which the whole poor were housed, industrious and profligate alike. Out-door relief, which had been prohibited by the above statute, was reintroduced by 36 Geo. III. c. 23, and before long, became the rule under a variety of systems, by which assistance was carried so far as to be a bounty on indolence. The poor-rates rose immensely, and it became the subject of general complaint, that the able-bodied out-door pauper enjoyed a degree of comfort which destroyed all stimulus to exertion. The result was the passing of statute 4 and 5 Will. IV. c. 76, which has remodelled the whole administration of the poor-law, and greatly extended the workhouse system. The Commissioners appointed by that act, and the public Board substituted for these Commissioners in 1848, have been empowered, under certain restrictions as to consents, to order workhouses to be built, altered, or enlarged as they

see fit, and may make by-laws for their government, which the justices are to enforce. The various workhouse officers, including master, matron, schoolmaster, schoolmistress, nurse, porter, and superintendent of out-door labour, have all their proper functions assigned them. Persons having an order, either from the Board of Guardians, the relieving officers, or the overseers, are at all times entitled to admission; and in cases of necessity, applicants must be admitted without an order. If the house be full, the master is bound to refer the applicant to the relieving officer, whose duty it is to find him relief elsewhere. Casual poor wayfarers, admitted by the master or matron, are to be kept in a separate ward. There are various statutory enactments regulating the discipline of workhouses. Refusal to work at any suitable employment, intoxication, or other misconduct, is punished with imprisonment and hard labour, not exceeding 41 days. A pauper absconding with clothes, or other property belonging to a workhouse, is liable, under 7 Vict. c. 101, and 13 and 14 Vict. c. 101, to imprisonment and hard labour. The separation of man and wife, which is the usual rule, is, by 10 and 11 Vict. c. 109, relaxed when they are above 60 years of age. By 11 and 12 Vict. c. 110, persons professing to be wayfarers or wanderers are to be searched on admission, and any money found on their persons is to be applied to the common fund of the Union; and an applicant for relief concealing such money, is to be punished as a disorderly person. In every workhouse, a register is to be kept of young persons under 16 hired as servants or bound apprentices, and the relieving officer is bound to visit them twice a year, and inquire into their food and treatment.

Workhouses are of various sizes. One of ordinary dimensions comprehends accommodation for 450 to 700 inmates of both sexes and different ages; others, in populous neighbourhoods, as near Manchester, will accommodate 1500 inmates. Classification as regards sex and age is an important particular, and is usually well attended to. In some situations, the able-bodied inmates work at field-labour within boundary walls. There is no going in and out at pleasure. A workhouse is a sort of prison under stern, though not unkind discipline, and the leading principle always held in view is, that the offer of being accommodated shall act as a terror to idly-disposed persons, who are inclined to seek parish relief. The establishment of a workhouse really has this salutary effect; where there is no workhouse, the pressure on the poor-rates is generally excessive. A half-empty workhouse is thought a proof of good poor-law management. The administration of the workhouses of London and some other large towns has recently been the subject of unfavourable comment on the part of a large portion of the press and public; it being asserted that the regulations of the Commissioners are habitually transgressed, and the comfort and health of the pauper are sacrificed out of consideration to the ratepayers' pockets. The subject is expected to be shortly made matter of legislation.

In Ireland, each of the unions of town-lands or parishes into which the country is divided has its separate workhouse, under the management of a Board of Guardians chosen by the ratepayers, and relief is administered almost entirely in the workhouse.

In Scotland, the name workhouse is sometimes given to institutions for the support of paupers, but their correct legal designation is **POORHOUSE**. Previous to act 8 and 9 Vict. c. 83, establishments for the reception of paupers had been erected in many of the larger towns of Scotland, and the expense connected with their maintenance was considered

a proper charge on the funds. Admission to these almshouses was granted, as a matter of favour, to the more deserving of the aged, infirm, and friendless poor. No system of discipline was enforced, as any improper conduct could at once be checked by expulsion of the delinquent.

Act 8 and 9 Vict. c. 83, which made a complete change in the poor-law system of Scotland, affords powers for the erection of new poorhouses, and for the enlargement and greater efficiency of those that previously existed. The classes of poor for whom they are designed are described as 'the aged and other friendless and impotent poor,' and 'those poor persons who, from weakness or facility of mind, or by reason of dissipated or improvident habits, are unable to take charge of their own affairs.' The Parochial Board of any parish, or combination of parishes, which contains above 5000 inhabitants, may erect a poorhouse as soon as a resolution to that effect has been approved by the Board of Supervision. Two or more contiguous parishes, with the concurrence of the Board of Supervision, may build a poorhouse for their common use; but no poorhouse can be built, nor any existing poorhouse enlarged or altered, until the plans have been approved by the Board of Supervision. The Parochial Boards of parishes, or combinations of parishes, in which there is a poorhouse, may receive poor persons from other parishes at rates approved by the Board of Supervision. When two or more parishes unite to build a joint poorhouse, the expense of its erection and maintenance is apportioned as determined by the parishes; and for the purpose of erecting, altering, or enlarging a poorhouse, power is given on certain conditions to borrow money on the security of the future assessments of the parish or combination.

Parochial Boards were empowered by the above act, under the sanction of the Board of Supervision, to frame regulations for the management and discipline of poorhouses. But the Board of Supervision has found it expedient, for the sake of greater efficiency and uniformity of management, to frame a general code of regulations, which, with a few modifications for peculiarly circumstanced parishes, now form the existing rules by which the Scottish poorhouses are administered. The management of each poorhouse is committed to a house-governor and a matron, subject to the orders of a committee of the Parochial Board or Boards of the parish or parishes to which the poorhouse belongs. There are minute provisions for the classification of inmates according to age and sex, the discipline, medical attendance, religious instruction, diet of the inmates, and the duties of the different officers. Each poorhouse is to be visited at least once a week by a committee of two or more members of the Parochial Board, who are to institute an inquiry regarding a number of specified particulars, the answers to which inquiries, are to be submitted to the House Committee at each meeting. There are at present about 40 poorhouses in Scotland in connection with 190 parishes.

WORKING-DRAWINGS are the large plans prepared by engineers and architects to guide the workmen in executing the design. Many of these are on a large scale, all mouldings and ornamental work having to be drawn out of the actual size of the work.

WORKING-PARTY, a body of soldiers told off, by command, to perform certain work or labour foreign to their ordinary duties. A small extra pay, called 'working-pay,' is allowed, averaging about 4*d.* a day.

WORKINGTON, a market-town and seaport of

Cumberland, about a mile from the mouth of the Derwent, 7 miles direct north of Whitehaven, and the same distance by railway. Its harbour, furnished with a breakwater and several quays, is safe and commodious. To the coal-mines in the vicinity the town chiefly owes its prosperity—great quantities of coals being exported—but iron-foundries, malt-kilns, flour-mills, shipbuilding yards, rope and sail-cloth factories, breweries, and chemical works are in operation. Salmon fishery is carried on in the river. Railways run north, south, and east from W., establishing communication in all directions. In 1865, 1444 vessels, of 128,663 tons, entered and cleared the port. Besides coals, the exports are pig and malleable iron, and the imports timber, &c. Pop. (1861) 6467.

WORKS, BOARD OF. By 46 Geo. III. c. 142 (altered by 50 Geo. III. c. 52), the management and control of public works and buildings, of which the expenses are defrayed from the crown revenues or parliamentary grants, were intrusted to an officer called the Surveyor of his Majesty's Works and Public Buildings, whose duties included the superintendence of the erection and repair of royal palaces, and buildings used for the various branches of government, and the management of public museums and parks. In 1832, the duties of this officer were transferred to the Commissioners of Woods, Forests, and Land Revenues (see **WOODS AND FORESTS**); but this arrangement eventually resulted in a complaint that the crown revenue was applied too easily to the execution of public works and improvements, by which means the Exchequer was deprived of the funds which were due to it in exchange for the Civil List, and parliament was unable to exercise the proper control over an important branch of public expenditure. The department of Public Works was therefore again separated, in 1851, from that of the Woods and Forests, and placed under the management of a new Board, called the Board of Works and Public Buildings, composed of a First Commissioner, specially appointed, who is a political officer, and has a seat in the cabinet, together with the Secretaries of State, and the President and the Vice-president of the Board of Trade, who are *ex-officio* commissioners. In addition to the control over public works and buildings, possessed by the former united Board, the Board of Works has also the management of the parks in the metropolis, including the public parks formed under recent acts, and of Richmond, Greenwich, Bushy, Phoenix, and Holyrood Parks, and the public gardens at Kensington, Kew, and Hampton Court. Among the duties of the Board are, the providing of public walks, and access to the national buildings and collections—a branch of administration which has, of late years, assumed a prominence which it did not formerly possess. The Board is also charged with many arrangements and responsibilities connected with the making of new streets and roads, in London and elsewhere, and the erection and repair of public statues. The Board of Works is under control of the Treasury, to whose sanction all large estimates for public works must be submitted. The Treasury appoint the secretary, clerks, and other officers of the establishment; and with the sanction of the Treasury, the Commissioners appoint or employ such architects, surveyors, &c. as may be necessary. The salaries and expenses of the department, and the charges for all her Majesty's public works, are annually voted by parliament. The accounts of receipt and expenditure are annually transmitted, to be audited by the Commissioners for auditing Public Accounts.

WORM FEVER is a popular name for the

affection more scientifically known as *Infantile Remittent Fever*. Although it is a disease which presents great differences in its course and symptoms, according to the circumstances which have given rise to it, its characteristic symptoms will be found to point (as Sir Henry Marsh, the eminent Dublin physician, long ago observed) to the mucous membrane as the original seat of morbid action. The disease seldom occurs during the first year of life; but from the second to the twelfth year, it is an affection often met with. Premonitory symptoms usually occur, and may last for some days. These symptoms are thus described by Dr Evanson: The child looks ill, and loses his colour; he is languid or fretful; complaints of pain in the head or belly, is drowsy, but rests badly, starting in his sleep, or grinding his teeth. The appetite fails, the tongue becomes loaded, and the breath offensive. Fever now sets in; or the attack may commence with high febrile symptoms, and be ushered in by a cold fit. When once established, the fever is remarkable for the distinctness of the exacerbations, the daily number of which varies in different cases. There is, however, usually one well-marked exacerbation, occurring in the evening, and lasting till morning, and followed by a profuse sweat. Three is a common number—namely, one in the morning, one in the afternoon, and a third at night. However cool and lively the child may at other times be, it becomes fretful, hot, and heavy, as the exacerbation approaches. During the febrile period, all the symptoms become aggravated. As the period of remission approaches, these symptoms gradually become less severe, and more or less perspiration appears. As the general disease declines, the intermissions become lengthened, while the exacerbations diminish in duration and in intensity. Worms are often present in remittent fever, and give rise to many of the above-named symptoms; but as the symptoms often remain after worms have ceased to be expelled, the latter cannot be regarded as being always the sole cause of this disease.

With regard to the treatment of remittent fever, the first point is to improve the condition of the intestinal canal, and to correct the morbid secretions poured into it. 'From the deranged state of the secretions,' says Dr Evanson, 'the occasional use of a mercurial is often very beneficial; and it may be given combined with an aperient or a diaphoretic, according to the circumstances. The powder of jalap, simple or compound, is that which we prefer, and the addition of some ipecacuanha increases the effect.' He recommends the following formula: Powdered jalap, 30 grains; powdered ipecacuanha, 5 grains; calomel, 5 grains; white sugar, 10 grains. From 2 to 5 grains of this powder may be given every three hours, till the bowels are freely moved. He adds that, to give cold drinks, and keep the body cool by light clothing and the use of an airy apartment (while we enjoy quietness, and occasionally exclude the light), is essential to recovery. When the bowels are not irritable, a solution of crystals of tartar (bitartrate of potash) given cold, in the form of *Imperial* (see TARTARIC ACID), possesses many advantages, as it acts on the kidneys, while it allays thirst, and tends to keep the bowels open. In the more advanced stages, when debility sets in, we have found the mineral acids useful. They can be employed much sooner than quinine; but the latter may occasionally be prescribed at the close of the complaint. If there are decided signs of intestinal inflammation, leeches must be applied to the abdomen; when there is mere intestinal irritability, Dover's Powder and the warm bath will give relief.

If diarrhoea cannot be checked by other means, turpentine, in doses of one or two drops, rubbed up with gum-water, may be tried. In relation to diet, the great point is to avoid giving such food as leaves a bulky, indigestible residue. When convalescence begins, change of air often affords remarkable benefit.

WORM-GRASS. See SPIGELIA.

WORMS, or VERMES (COMPARATIVE ANATOMY). Most zoologists regard the worms as constituting a subdivision of the ARTICULATA; but one of our latest and best writers on classification, Professor Huxley, confines the synonymous terms ARTICULATA and ARTERIOPODA to the Insects, Myriapoda, Arachnids, and Crustaceans; and places the higher worms, or *Annelids*, with the above classes, in a primary division, or sub-kingdom, of ANNULOSEA; and the less highly organised worms, *Scolecids* (in which he includes the *Rotifera* or wheel-animalcules, the *Trematoda* or flukes, the *Taniada* or tapeworms, the *Nematoidea* or thread-worms, the *Acanthocephala* and the *Gordiacea*), in a sub-kingdom, to which he applies the term ANNULOIDA. The main reasons of his placing the worms under two great subdivisions are—(1) that the Annelids resemble the Arthropoda in the arrangement of the nervous system, which constitutes a ganglionated double chain, traversed at one point by the oesophagus; (2) none of the Scolecids possess any characters in common with the Arthropoda generally, or the Annelids, other than those which they have in common with all animals. No scolecid has a definitely segmented body, or bilaterally disposed successive pairs of appendages, nor has it a longitudinal chain of ganglia. These grounds of difference outweigh, in his opinion, the many points of resemblance between the Annelids and the Scolecids—as (1) the resemblance between the ciliated larvæ in many cases; (2) the resemblance between the forms of the mature bodies of many Scolecids with that of one of the most familiar of Annelids, which is so close as to have acquired for the Scolecids the popular name of 'worms;' and (3) the fact, that in the Annelids we see the representatives of that singular system of vessels which attains a perfect development in the 'water-vascular' apparatus of many Scolecids. The final settlement of the classification of these animals must be decided by further investigation.

With regard to the general characters of worms, it is well known that they are usually of a very elongated form. In the higher groups, the division of the body into a number of segments is very distinct; while in some of the lower forms no segmentation can be detected. The segments, when present, are usually homonomous, or, in other words, are mere repetitions of one another. The soft and contractile body may be cylindrical or slightly compressed, or it may be flat and broad, and usually presents a distinct dorsal and abdominal surface. The lateral region is often provided, in the higher forms, with special appendages, resembling minute stumps, which take part in the respiratory process. Amongst the cuticular appendages must be mentioned the bristles (*setæ*), hairs, hooks, &c., which are often seen. The nervous system of the highest worms—the Annelids—has been already sufficiently described in our notice of Professor Huxley's views. From this condition it appears in the Scolecids to become more and more rudimentary, till in the parasitic worms it totally disappears. The mouth is absent in the lower forms, but in the higher lies in the mesial line of the abdominal surface, in close approximation to the chief nervous (pre-oral) ganglion, from which most of the organs of the senses derive their nerves, as the eye, the auditory apparatus,

and the organs of touch (especially the lips). Some of the parasitic worms, as the tapeworms, &c., are totally devoid of an intestinal canal; others, as the Turbellaria (with few exceptions), and the Trematoda, have an intestine, but no anal aperture; while the rest have an intestine provided with both mouth and anus. The latter, when present, lies on the posterior part of the body, and sometimes (as in many Turbellaria) on the dorsal surface. Except in the Gephyrea or Sipunculacea, the intestine, when present, is simple, and devoid of convolutions, but is often, as in the leech, provided with lateral blind sacs. The vascular system in the most highly organised worms consists of a closed system of arteries and veins, presenting modifications in different genera. A large vessel which runs beneath the dorsal integument may be seen under a microscope to contract and propel the blood forward, thus fulfilling the functions of a heart, and being the homologue of the dorsal vasiform heart of insects; while a corresponding venous trunk conveys the blood in an opposite direction, and runs along the under surface of the body. These great trunks are united at each segment by transverse vessels, which carry the blood from the ventral vein to the dorsal artery. In the Nematelmia, or parasitic round-worms, the system is much simpler; and in the lowest worms, no trace of true blood-vessels is discernible. None but the Annelida (q. v.), or highest worms, possess special respiratory organs. These occur in various forms. Thus, in the leech and earthworm, a series of pores on each side of the body lead to as many simple sacculi formed by an inward folding of the integument. In the tubicolous Annelida, such as the *Serpula* (a common inhabitant in the aquarium), the respiratory organs are in the form of long flattened branchia, radiating from the head, and generally disposed in a spiral form. When not filled by the red circulating fluid, which the Annelida generally possess, they are often beautifully tinted with purple, green, and yellow colours, and form a gorgeous crown. In the *Arenicola piscatorum* (figured in the article ANNELIDA), the respiratory organs are seen lying as lateral tufts in the middle part of the body (fourteen or sixteen in number on each side). In the lower worms, there are no definite respiratory organs, the process being carried on partly by the surface of the skin generally, and partly by the water-canals noticed in the article TAPEWORM. As a general rule, the worms are hermaphrodites, only one of the five classes into which they are divided—viz., the *Nematelmia*, having the sexes separate. A large number of the lower kinds are parasitical; the others are inhabitants of sea and fresh water, mud, earth, &c.

The worms are arranged by V. Carus into the five following classes: (1.) *Annulata*, corresponding to the *Annelids* of Owen, and described in the article ANNELIDA. (2.) *Gephyrea*, including the Sipunculus and its allies. (The term is derived from the Greek *gephyra*, a bridge, because the animals included in it form a connecting link or bridge between the Echinoderms and the true articulate animals.) In the article SIPUNCULUS (q. v.), in which, according to the old view, that animal is regarded as an echinoderm, there is a figure of a British species, the *Sipunculus Bernhardus*. (3.) *Chaetognatha* (signifying *shaggy-jawed*, from the Greek *chaiteis*, shaggy, and *gnathos*, a jaw), including the single genus *Sagitta*, which was formerly erroneously placed among the Nucleo-branchiated Molluscs. As the *Sagitta* is not elsewhere described in this work, we may notice that it is a little fish-like animal with a distinct head, the mouth armed with several pairs of lateral hook-like jaws, with an

elongated body furnished with one or two pairs of fin-like organs, and with a broad and usually bilobed caudal fin. The *sagitta* (so called from its arrow-like appearance) is of small size, swims with great

Sagitta.

rapidity, and is common in the Mediterranean and in the North Sea. (4.) *Nematelmia* (from the Greek *nema*, a thread, and *helmins*, a worm), which are described in a special article. (5.) *Platyelmia* (from the Greek *platys*, flat, and *helmins*, a worm), or *Flat-worms*, which are divisible into the three orders: (1) *Turbellaria*, including the Planarias, &c.; (2) *Trematoda*, including the Flukes; and (3) *Cestodea*, including the Tapeworms. These orders are described in special articles.

For further information on the subject of this article, the reader is referred to the various works and Memoirs of Milne-Edwards, Grube, De Quatre-fages (especially his *Rambles of a Naturalist*), Schmarda, Blanchard, Leuckart, Williams of Swansea (in the Reports of the British Association), &c. The British worms have not yet been fully described by any competent naturalist, although the labours of Williams of Swansea and Johnston of Berwick (both too early lost to science), are excellent as far as they go. Dr Johnston's *Catalogue of the British Non-parasitical Worms in the Collection of the British Museum* (Lond. 1865, pp. 366), with 20 plates, must be consulted by all who take an interest in this subject, although, in consequence of the delay in its publication, much of it is out of date. It is understood that Dr Mackintosh, one of the most distinguished of the younger generation of Scottish naturalists, is preparing a work on the British Worms for the Ray Society.

WORMS, AS A DISEASE OF INFANCY. As we have elsewhere (see ASCARIS, ENTOZOA, TAPEWORM, and VERMIFUGES) treated of the natural history of the worms infesting the human subject, and of the remedies to be employed for their expulsion, we shall mainly confine ourselves in this article to the symptoms which are usually considered to be indicative of the presence of worms in children. These symptoms are, however, in reality, only evidence of irritation of the mucous membrane of the intestinal canal, which may be due to other causes than worms, as, for instance, the presence of indigestible matter, unhealthy secretions, or the existence of a morbid condition of the membrane itself. 'Indeed, the latter,' says Dr Evanson, 'would seem necessary, in many instances, for the production of any symptoms, although worms were present; as they have been passed by children in perfect health, who experienced no inconvenience on their account. Even the evacuation of worms does not prove that the symptoms present were caused by them, though doubtless they are likely to have been aggravated thereby. The worm may have been but an accidental accompaniment—a morbid condition of the mucous membrane being the true source of the symptoms.'—*On the Diseases of Children*, 4th ed. p. 345. Although all the symptoms commonly referred to the presence of worms may exist without them, yet there is a group of symptoms which pretty certainly indicate their presence, and which, when occurring together, should, at all events, excite our suspicions. These symptoms are divisible into (1) those dependent directly on the presence of worms in the intestines; and (2) those connected with the

sympathetic relations of the digestive organs, and due to some form of reflex nervous action.

(1.) 'Worms,' says Dr Evanson, 'may be suspected to be present when a child looks pale and grows emaciated, while his belly swells and becomes hard—a gnawing, pungent, or twisting pain being felt in the stomach or about the navel. The appetite is usually precarious, at times voracious; the breath is fetid; and the bowels often deranged, being alternately purged or costive, and much mucus passed in the stools. There is commonly picking of the nose, or irritation (often excessive itching) is felt in the lower part of the bowels; and when a child is old enough, he may complain of a sense of sinking or fainting, which seems to attend particularly on the irritation caused by worms. When symptoms are present, and cannot be accounted for by the existence of disease of the mucous membrane or of the mesenteric glands, we have good reason for believing that worms are their cause.—*Op. cit.*, p. 347.

(2.) Amongst the most marked sympathetic symptoms are those of the head. The sleep becomes unquiet, and the little patient is liable to start up suddenly from slumber; grinding of the teeth is common; the pupils are often dilated, and there may be headache, and sometimes convulsions—symptoms painfully like those of Hydrocephalus (q. v.), but often disappearing on the expulsion of worms. A dry cough, unaccompanied by any signs of disease of the thoracic organs, is regarded as a sympathetic or reflex symptom of worms; and vomiting, hiccough, diarrhoea, tenesmus, and bloody stools often accompany their presence. The Round-worm (*Ascaris lumbricoides*) may be present in the small intestine (its ordinary seat) in large numbers without occasioning any disturbance; but when it does give rise to symptoms, the most prominent are sharp colicky pains about the navel, faintness, great emaciation, and voracious appetite. The Thread-worm (*Ascaris* or *Oxyuris vermicularis*) chiefly occurs in the rectum, where it often exists in large numbers, looking like bits of cut thread. In a recently voided stool, they are seen to be in rapid motion; hence they are called *Ascarides* (from the Greek *askaridzein*, to jump), and hence also, in all probability, the great distress which they occasion as compared with the quiet round-worms. The characteristic sign of the presence of these thread-worms is the itching and irritation felt in the rectum.

WORMS, an ancient and interesting but decayed town of Hesse-Darmstadt, in a highly fruitful district on the left bank of the Rhine, twenty miles south-east of the town of Darmstadt, and communicating with Mainz and Mannheim by railway. Pop. 10,325. Among its churches, the chief is the cathedral, a massive building in the Byzantine style, with four towers, founded in the 8th, and completed in the 12th century. On a hill near the church called the *Liebfrauenkirche*, a highly esteemed wine, called *Liebfrauenmilch*, is grown. The manufacture of polished leather employs 2000 hands; tobacco is also manufactured, and a trade in the wines and the agricultural produce of the vicinity is carried on. W. is one of the oldest cities of Germany, and is the scene of the *Nibelungen-Lied* (q. v.). It was occupied by the Romans, destroyed by Attila, and afterwards rebuilt by Clovis. It was frequently the residence of Charlemagne and his Carolingian successors, was the place of convocation of many German diets, and was erected into a free imperial city by the Emperor Henry V. The most famous diet held here was that at which Luther defended his position as a Reformer before Charles V. and the assembled princes and statesmen of the empire. See REFORMATION. The industry and commerce of W. were great during the

middle ages, and its pop., as far back as the time of the Hohenstaufens, averaged 60,000, and even amounted to 30,000 at the close of the Thirty Years' War, but it was almost wholly destroyed by the French in the destructive war of 1689; and though soon after it was rebuilt on a smaller scale, it has never recovered its former prosperity. The site of the old town is only partially occupied by the present one, the rest being laid out in gardens. Here, in 1743, an offensive and defensive alliance was entered into by Great Britain and Austria with Sardinia.

WORMS, an island with an area of about 36 sq. m., belonging to the Russian government of Esthonia, and lying to the east of Dagö. It is flat and generally well-wooded in the interior, and throws out numerous steep promontories, round which strong currents run, so that, often for months together, it is cut off from all intercourse with the neighbouring islands of Oesel, Dagö, Runö, &c., as well as with the mainland; and thus the inhabitants, who are of Swedish origin, have remained unmixed with foreign elements. A stranger is a rare and astonishing phenomenon on this island; and he, in his turn, is not less surprised at the peculiar old Swedish dialect, the architecture, and the manners and customs of this small, poor, but happy insular people.

WORM-SEED is the popular name for *santonica*, from which Santonin (q. v.) is extracted.

WORMWOOD is the popular name for *Artemisia absinthium*. It not only acts as an anthelmintic, as its name implies, but it likewise possesses tonic and stimulant properties, which

Wormwood (*Artemisia absinthium*).

prevent the reproduction of worms after their expulsion. An *Infusion of Wormwood*, made by pouring a pint of boiling water over an ounce and a half of the dried plant, letting it stand for an hour, and straining, taken in doses of a couple of ounces once or twice a day, is a very good domestic tonic, and may be prescribed with advantage even in cases where worms are not suspected.

WORSAAE, JENS JACOB ASMUSSEN, a distinguished Danish archæologist, was born in 1821 at Veile, in Jutland, where his father held the post of *justitierraad*, or councillor of justice. W. received

the rudiments of his education at the Gymnasium of Horsens, from whence he proceeded, in 1833, to Copenhagen, with the intention of studying theology. Having, however, soon exchanged his theological studies for law, and again as speedily relinquished the latter, he turned his whole attention to the history and archaeology of the north, which had from an early age presented special attractions to his mind; and in 1838 he obtained the place of assistant in the Royal Museum of Northern Antiquities at Copenhagen, which was then under the direction of the able Danish archaeologist, C. J. Thomson, to whom this most valuable collection owes its origin and its present state of excellence. In 1844, appeared W.'s important work, entitled *Runamo og Bravalla Slaget*, in which he, with consummate skill and profound erudition, definitely settled the long-pending doubts as to the authenticity and character of the Bleking rock inscriptions, and satisfactorily shewed, that the supposed runes were no runes at all, but the mere weatherings of the rock; and consequently, that the interpretation given by the great Icelandic scholar, Finn Magnussen (q. v.), had no existence but in the mind of its author. This bold but conclusive solution of a long-pending problem, which, from the days of the great Danish historian, Saxo Grammaticus, had occupied the attention of the most learned men of the north, at once placed W. in the foremost rank of northern archaeologists; and the numerous works and monographs which have appeared from his pen since then, have fully justified the high promise given by his early labours. During the ten years intervening between this period and his nomination in 1854 to the honorary rank of Professor in the university of Copenhagen, W. made repeated visits to the other Scandinavian lands, to Great Britain, Germany, France, and other parts of Central Europe, which retained traces of the former presence of the Northmen. The Danish government defrayed the expenses of several of these journeys, the results of which have been the publication of numerous works and papers of interest, among which we may instance his *Minder om de Danske og Nordmændene i England, Skotland og Irland* (Copenhagen, 1851); or *Memorials of the Danes and Norwegians in England, &c.*, of which an English translation appeared the following year; and his treatise *Om en forhistorisk taalalder tyk Befolkning i Danmark* (Copen. 1849); &c. Some of the most important of his works on the archaeology of his native country are his *Danmarks Oldtid oplyst ved Oldsager* (Copen. 1843); *Blekingeske Mindesmærker fra Hedenold*, 1846; *Danvirke*, 1848; and his *Afbildninger fra det Kongelige Museum for Nordiske Oldsager*, 1854. W. has always shewn himself a warm patriot, and a strenuous opponent of the spread of German tendencies in the duchies, and his views in this direction were forcibly enounced in his *Jylland's Danishhed*, a treatise published in 1850, and especially directed against Jacob Grimm's exposition of the question of German national law. W.'s merits have been fully recognised by his countrymen; and the Danish government has constantly shewn its sense of the estimation in which he was held, by placing him at the head of all important commissions connected with the archaeology of the country, appointing him to important posts in connection with the University and Antiquarian Museums, and bestowing upon him various other marks of confidence and respect.

WORSTED. Besides the application of this term, explained under **WOOL** and **WOOLLEN MANUFACTURES** (q. v.), it is also applied to the thick loose woollen yarn used for knitting stockings, &c., known in trade as *fingering yarn*.

WORT. See **BEER**.

WORTHING, a fashionable and rapidly-rising watering-place on the Sussex coast, ten miles west of Brighton. The pop., in 1866, was about 8000. Its importance began with the century, as, prior to that date, it was merely a small unvisited fishing-village. The climate is much milder than that of Brighton, the town and its immediate neighbourhood being encircled on the north and north-east by almost an amphitheatre of hills, which greatly shelter it from northerly winds, and render it one of the best places for a *winter* resort on the south coast. The town has no noxious trades or manufactures, but is essentially a place of resort for pleasure-seekers and invalids. It has one of the finest and longest sea-parades in the kingdom, being nearly two miles in length. The town has recently undergone a costly system of drainage, and is well supplied with water; whilst its mortality tables bespeak its salubrity, being for the last seven years at the rate of only 14.5 per 1000.—See Dr Barker *On the Climate of Worthing* (Churchill, London).

WOUNDS may be defined to be divisions of soft parts produced by external mechanical force. They have been classified by surgical writers in various ways, but the most useful arrangement is that which is adopted by Mr Paget, in his admirable Memoir on 'Wounds,' in Holmes's *System of Surgery*, and is based on their mode of infliction. They are thus divided, first, into *open* and *subcutaneous* wounds: the former including those in which the outer part of the wound is almost or quite as extensive as the deeper part; and the latter, all those in which the outer part of the wound is very much smaller than the deeper part. These wounds (especially those of the first kind) may be further divided into (1) *incised wounds*, such as cuts or incisions, including those which remove a portion of the body; (2) *punctured wounds*, such as stabs; (3) *contused wounds*, in which the divided parts are bruised or crushed; (4) *lacerated wounds*, in which there is tearing of the tissues; (5) *poisoned wounds*, in which some poison or venom is inserted; and to these may be added, as a special variety, (6) *gunshot wounds*.

Simple, open, incised wounds will be more fully noticed than any of the others, because they have been most fully studied, and in their surgical relations are the most important. In a clean cut, whether made accidentally or in a surgical operation, three things are chiefly to be observed—viz., the opening or gaping by the retraction of their edges, the bleeding, and the pain. The *gaping* of a wound is caused by the retraction of the various tissues which are divided. Of the various tissues, the skin exhibits the greatest degree of retraction, and then (in the order in which they stand) elastic tissue, cellular or connective tissue, arteries, muscles, fibrous tissues, nerves, and cartilages. In addition to the immediate gaping of fresh wounds, many wounds, if they be not prevented, will continue to retract for a long time. For example, in stumps that heal slowly, the limb terminates in a cone, in consequence of the prolonged retraction of the muscles. The *bleeding* from an incised wound depends chiefly on the size and number of the divided vessels, and on their connection with the surrounding parts, but to a certain extent on the previous condition of the wounded part, or on the peculiar constitution of the patient. Gradually, with or without surgical help, the vessels cease to bleed; and then, if the wound be left open, there is an oozing of blood-tinged serous fluid, succeeded gradually by a paler fluid, which collects like a whitish film on the surface, and contains an abundance of white or colourless blood-cells, imbedded in a fibrinous (and therefore

spontaneously coagulating) fluid. The nature of the pain cannot be made clear by any description to those who have not felt it; and it is more than probable that a similar wound inflicted on two or three persons would occasion different degrees of pain in each. There are also differences, as Mr Paget has pointed out, 'in both the kind and degree of pain, according to the place and manner of the wound. Thus, in regard to the skin, wounds of the face and of the extremities of the fingers and toes, seem to be amongst the most painful; those of the back amongst the least so; and wounds cut from within are less painful than those from without. The skin appears far more sensitive to wounds than any of the deeper structures, except the nerves of sensation themselves; but any part (as periosteum or tendons) may become, by disease or distention, highly sensitive.'—*Op. cit.*, p. 581. The local consequences of an incised wound are indicative of inflammation. In the course of an hour or more, the edges of the wound and the adjacent parts become swollen and abnormally sensitive, feel hot and aching; the sutures (if any have been inserted) become tighter, and the edges and intervening spaces gape in consequence of the swelling. These symptoms gradually subside in two or at least four days, unless there is some abiding source of irritation. Except in very severe wounds, no general consequences are apparent. In these exceptional cases, as in amputations, for example, a shock and subsequent reaction (both of which are described in the article SHOCK) are observed. The duration of this febrish reaction or traumatic fever does not seem to bear any fixed relation to the severity of the injury. Sometimes it subsides within twenty-four hours; more often, after large wounds, it does not subside for three or four days, when the pulse and breathing gradually return to their natural standard, and the skin becomes soft and cool. The beginning of suppuration often coincides with the subsidence of the fever. If the fever should last more than four or five days after the receipt of the injury, there is probably some persistent irritation or some morbid complication.

The healing of open incised wounds may be accomplished, according to the high surgical authority from whom we have already quoted, in five different ways, if we include those in which the process is assisted by treatment—viz. (1) by immediate union, or (in surgical language) by union by the first intention; (2) by primary adhesion, or union by the adhesive inflammation; (3) by granulation, or by the second intention; (4) by secondary adhesion, or the third intention—i. e., by the union of granulations; and (5) by scarring under a scab, the so-called subcutaneous cicatrization. Healing by immediate union takes place when the wounded parts being placed and maintained in contact, first stick together, and then become continuous, without the formation of any new material as a connecting medium. For example, a flap of skin is raised by dissection in the removal of a tumour or a mammary gland, and is then replaced on the subjacent parts. In three days at most, the union may be complete, without any indication of inflammation, there being no evident efflux of blood, no exudation of reparative material, and no scar. In healing by primary adhesion, lymph exudes from both cut surfaces, becomes organised, gradually connects the cut surfaces, and at length forms between them a firm layer of connective tissue, covered with a thin shining cuticle. These steps are well seen after the operation for hare-lip, for example. In healing by granulation, the wound becomes coated over with the white film, containing colourless blood-cells, as already described. If these

glazed surfaces are brought and kept together, they will probably unite, the film becoming organised, and contributing to form a bond of union; but if the wound be left open, the film increases, and takes part in the formation of Granulations (q. v.). We cannot enter into the life-history of these granulations, and can only remark, that they are finally developed into a scar, consisting of fibro-cellular or connective tissue, with a superficial layer of epidermis. The completion of the healing is accomplished by the gradual improvement of the scar, in which the connective tissue becomes more perfect in its character, and the cuticle becomes thicker and more opaque. Healing by secondary adhesion, or by third intention, 'is accomplished by the union of two granulating surfaces (e. g., those of two flaps after amputation) placed and maintained in contact. In this state the two surfaces simply unite, or else new material, produced from either or both surfaces, adheres to both, is organised into continuity with both, and then unites them.'—Paget, *op. cit.*, p. 586. Healing by scabbing, or under a scab, is, according to the same authority, the most natural, and in some cases the best of all the healing processes. In animals, it is often observed that if a wound be left wide open, the blood and other exudations dry on its surface, and form an air-tight covering, under which scarring takes place, and which is cast off when the healing is complete. In man, this process is less frequent, because, in the first place, exudations seem to be more often produced under the scab, which detach it, and prevent the healing; and secondly, surgical interference seldom allows this method to have a fair trial.

Such are the several modes of healing of simple, incised, and all open wounds. We have now to consider the nature of the processes therein concerned. Every wound is followed by more or less tendency to an inflammatory process. This tendency may not proceed beyond an increased sensibility of the part and a slight efflux of blood, and there may be no inflammatory exudation; and this is the best condition for healing by immediate union in which no new material is required; or the inflammatory process may go on to the production of lymph, and then cease—a condition essential to healing by adhesion. In healing by granulation, a very low degree of inflammation (such as is requisite for the effusion of the first materials for granulation) is best; while for healing by secondary adhesion or by scabbing, inflammation must be altogether absent. The due understanding of these relations of inflammation and the healing processes of open wounds, affords important aid as to the mode of treatment. Nothing should be done to excite or increase inflammation. So much as may be necessary for some of the modes of healing, is sure to occur spontaneously, and more will only do harm; on the other hand, the inflammation excited by the wound does not require special treatment, except in the case of organs (such as the eye, the peritoneum, the lungs, the large joints, &c.) in which serious mischief may be very rapidly induced by inflammation. The position of the wounded part is a subject of considerable importance. 'When comfort has, as far as possible, been secured, the next object should be that the wounded part should be relaxed, so that the edges of the wound may come near or together; that no part, and especially no muscle, should be on the stretch, and that the direction of the wound may be such as will allow fluids to flow away from some part of it.' In the great majority of cases, healing by immediate union, or by primary adhesion, is most desirable, and should be aimed at—the exceptional cases being wounds through many structures, and exposing considerable surfaces of

deep-seated bones; deep wounds whose depth far exceeds their length; wounds of which the deeper portions of the sides cannot be kept in good contact; wounds through parts in a very inflamed or otherwise disordered state; and those which are likely to be troublesome from secondary hæmorrhage—in all of which there is a fear of the collection of blood and other fluids under the closed integuments. In attempting to induce healing by either of these modes, the points to be attended to are—the arrest of the bleeding, the cleaning of the wound, the exact apposition of its edges, and their maintenance in this position, and the exclusion of the whole wound from the air. If the bleeding arise from vessels of considerable size, they must be tied, twisted, and pressed (according to Simpson's plan) or crushed at their ends; but all these means, and especially ligature, should be avoided if possible, because they are impediments to exact union; and spontaneous closure of the vessels by the action of cold air or water, and pressure with dry lint, is preferable. The cleaning of the wound is best effected by allowing a gentle stream of water to flow over it. Soft sponges are sometimes useful for this purpose; but they must be used as dabbing (not as scrubbing) agents, and the greatest attention must be paid to their cleanness: the sponge used for the wounds or sores of one patient should never be applied to those of another. Apposition is effected by padding and bandaging, Sutures (q. v.), and adhesive plasters—the former being useful in deep wounds, while the latter two serve for more superficial wounds. Although a simple incised wound, after its sides have been thus brought into complete contact, may be left exposed to the air, some covering to exclude the air is deemed preferable. Whatever is used should be light, not adhesive, and not prone to decomposition—its object being to protect the wound probably from a deleterious action of the air, and more certainly from sudden change of temperature, friction, and dust. Nothing is better for this purpose than lint soaked in oil, or simple cerate on perforated linen. The following remarks on the dressing of wounds are condensed from Mr Paget's Memoir. No general rule can be laid down regarding the time at which any or the whole of the dressings should be removed. In small wounds about the face, union may be complete in two days; but it is not so firm as to be safe from probable accidents, and metallic sutures possess the advantage of exciting so little irritation, that they may be left in their places for any length of time, till union is perfectly secure. They should therefore not be removed for four days, or, in the case of large wounds, for a week, or longer. They should not all be removed at once, and those that are removed should be replaced by strips of adhesive plaster; the union or scar must be cleaned most gently, and protected from the plaster with oiled lint. If, on the first dressing, the union or adhesion of the wound is progressing favourably, then it will usually be sufficient to dress it subsequently on every second day; and if all goes well, the union of small wounds may be regarded as safe at the end of a week, and that of larger ones at the end of ten days or a fortnight.

The rules which we have here given for inducing healing by immediate union or by primary adhesion may, in an emergency, be carried out by any intelligent reader, and ought to be generally known. We do not enter upon the modes of inducing the forms of healing by granulation and by secondary adhesion, as they ought to be carried on under surgical superintendence; nor do we notice the last mode—that of healing under a scab—because it is simply leaving the wound to nature: the most that is required in

this case in the way of auxiliary treatment being to cover the scab with dry cotton-wool, to protect it and the subjacent surface from any causes that may excite inflammation.

Of the other varieties of wounds, it is sufficient to notice the most important points severally peculiar to each variety. Of *punctured wounds*, the most serious are those which are made with blunt-pointed instruments, such as nails, pitch-forks, iron spikes, &c., for by these the injured parts are not so divided as that they may retract, but are pressed aside with much bruising, and can close again as soon as the instrument is withdrawn; and in this lies the chief danger of these wounds, because blood or other fluids are likely to extravasate into them, and cannot readily escape. These fluids, by decomposing or by mere pressure, may excite inflammation, and thus cause deep and confirmed suppuration, and great destruction of tissues. Some of the worst forms of these wounds are those produced by sharp teeth, probably (as Mr Paget suggests) because of the force with which, as they tend to meet, the teeth crush the intervening parts. In *contused wounds*, the great question is, whether their union should or should not be attempted. If union is to be attempted, the rules given for the treatment of incised wounds must be followed, especial attention being paid to their careful cleaning, the removal of clots of blood, and their warm covering with some soft material, as cotton-wool. When it would be useless, from the extent of the bruises, &c., to attempt union, the following rules, as laid down by Mr Paget, should be adopted: 'The part should be kept at rest, and as nearly as possible at its natural temperature. For the latter purpose, and for protection, an excellent dressing is lint or cotton-wool thoroughly soaked in olive oil, and completely fitted to the part. Dry cotton-wool may be applied over this, or oiled-silk. Water-dressing may be similarly applied, or warm poultices, but they are generally less comfortable. Irrigation is, in some cases, very soothing, especially in ragged wounds, but it should be with tepid water. The methods of the dressing, after the first, may be almost the same as for incised wounds.'—*Op. cit.*, p. 598. The treatment of *lacerated wounds* is almost precisely the same as that of contused wounds. *Poisonous wounds* are sufficiently discussed in the article VENOMOUS BITES; and there is a special article on GUN-SHOT WOUNDS, which are, in reality, only an important variety of contused wounds.

In conclusion, it must be mentioned that various kinds of wounds are liable to certain complications, of which some are local, and others general or constitutional. Among the former are recurring or secondary bleeding, pain, spasmodic muscular movements, and the presence of foreign bodies; whilst the latter include defect or excess of reaction, traumatic delirium, fever, erysipelas, pyæmia, &c. Some of these complications are treated of in special articles of this work; and for the treatment of the remainder, we must refer to Mr Paget's Memoir, from which most of the details of the present article are borrowed.

WOUVERMANS, PHILIP, a Dutch painter of note, was born in 1620 at Haarlem. From his father, Paul Wouvermans, a historical painter, he inherited a taste for art. He studied first with his father, and afterwards with John Wynants. He passed his entire life at Haarlem in the assiduous practice of his art, and died in the year 1668. Though his pictures are now highly valued, he is said to have had little immediate success, and to have lived in poverty, pretty much in the hands of the picture-dealers. His pictures are, for the most part, landscapes of small size, with figures profusely

introduced, commonly in energetic action. His battle-pieces, in particular, are greatly admired for their spirit and vigour. He had two brothers, also painters, JOHN and PETER, who executed subjects somewhat similar, and whose works have not unfrequently been attributed to him; but though both artists of considerable merit, they are plainly much inferior to Philip.

WRACK, or SEA-WRACK, a name sometimes applied indiscriminately to many of the larger *Algae* of the sea-shores, but also employed to designate the species of the genus *Fucus* (see FUCACEÆ), some of the most abundant of which are employed on the British shores for the manufacture of Kelp (q. v.), and are also much used as a manure. The genus *Fucus* has a leathery, dichotomous, generally flat, linear frond, usually furnished with large air-cells, which are included in the substance of the frond; the spores arranged in tubercles, imbedded in mucus, and collected in *receptacles*, through the pores of which they are finally discharged. *F. vesiculosus*, popularly known as *Sea-ware*, *Kelp-ware*, and in Scotland as *Black Tang*, is extremely abundant on all the rocky shores of Britain, growing between high and low water mark, and most plentifully near high-water mark, often struggling for existence on the very upper line, and even found among grass and moss in marshy ground occasionally overflowed by the tide. It is the species chiefly employed in the kelp manufacture, because it is more easily collected than any other. It is of a dark olive-green colour, sometimes two or three feet in length; the frond flat, entire on the margin, with a central rib; the air-cells spherical, in pairs, sometimes as large as hazel nuts; the receptacles solitary, terminal, turgid, compressed, mostly elliptical. Oxen, sheep, and deer eat it, and seek it on the sea-shore in winter when other food is scarce. In Gothland, it is boiled and mixed with a little coarse flour as food for hogs. It has been used medicinally in glandular affections, probably owing its value to the iodine which it contains.—*F. nodosus* is another very common British species, sometimes called **KNOBBED W.**, growing nearer to low-water mark than the last, and therefore not so often and easily accessible, but esteemed the very best species for the manufacture of kelp. It has veinless fronds, branched in a somewhat pinnated manner, with large solitary egg-shaped air-cells, in the central line of the frond. It sometimes attains a length of six feet.—*F. serratus* is also very common, and is easily distinguished by its serrated fronds, and the want of air-cells. It is sometimes called **BLACK WRACK**. It is less useful for kelp than the other species. In Norway, it is used as food for cattle, generally sprinkled with a little meal. It is preferred to other species for packing crabs and lobsters to be sent to market, as it keeps them moist, whilst, having less mucus than the other species, it is less apt to ferment and putrefy. Some other species of *F.* are common British *Algae*, although much less abundant than these. The use of W. for manure is of great advantage to farmers on the sea-coast. This kind of manure is better adapted for light than for clay soils. The effect is beneficial for almost all kinds of crop. The W. ought not to be allowed to lie long in a heap, as it is injured by fermentation, but as quickly as possible applied to the land, and covered by the plough.

Some of the *Fuci*, as *F. vesiculosus* and *F. serratus*, on receiving injury by which any part of the frond is broken, throw out a cluster of young sprouts from the injured part.

WRANGLER, the name given at the university of Cambridge to those who have attained first-class

honours in the public mathematical examinations. These examinations extend over eight days, the *pass* in the papers of the first three entitling a student to the degree of Bachelor of Arts. Those only submit to the remaining five days' examinations who are competing for mathematical honour. The word wrangler is derived from the public disputations in which candidates for degrees were in former times required to exhibit their powers, of which the form is still preserved in the exercises. The examination is confined to mathematics, pure and mixed; it is conducted by two moderators and two examiners. At the close of the first three days, lists are published of those who have passed for the common, or poll, degree; at the end of the eight days, again, lists are published of those who have merited mathematical honours. The honour men who compose the mathematical *tripos* number usually from 120 to 150, and are divided into three classes—*wranglers*, *senior optimes*, and *junior optima*—those in the last class being always the most numerous. The head of the *tripos* is called the *senior wrangler*. The number of wranglers, or men in the first class, varies from year to year. It has rarely been under thirty-five, and has often been forty-five or upwards, the number not being limited otherwise than through the application of a certain high standard of excellence.

WRASSE, or ROCK-FISH (*Labrus*), a genus of fishes of the family *Labridæ* (q. v.), of the section having cycloid scales, *Cyclolabridæ* of Müller. They have spiny fins, large thin scales, and an uninterrupted

Ballan Wrasse (*Labrus bergylla*).

lateral line. The mouth is protrusible, with thick fleshy lips, folded so as to appear double. The teeth on the jaws are simple, in one or more rows; the lower pharyngeal bones are completely fused together, and have broad grinding teeth. The form is somewhat perch-like, with the back more straight. There is a single long dorsal fin, the spines of the anterior portion of which are surmounted by short membranous filaments, the posterior portion having short and split rays. The ventral fins are under the pectorals. The colours are generally very brilliant. The species are numerous, abounding in tropical seas, but several of them are found on the coasts of Britain. They chiefly frequent rocky shores, and are generally seen in small shoals, often hiding under sea-weeds. They feed on crustaceans, molluscs, and marine worms. They are often caught by bait intended for other fish, but their flesh is not much esteemed. The **BALLAN W.** (*L. bergylla*, or *maculatus*) is one of the most common British species. It attains a length of about 18 inches, and a weight of more than three pounds. It is bluish green, paler on the belly, all the scales margined more or less broadly with orange red, the blue prevailing in some specimens, and the orange in others.

The Cook W. (*L. mixtus* or *variegatus*) is not unfrequent on the southern shores of England. Its prevailing colour is orange, striped transversely with blue, particularly in the male, the colours of the sexes differing so much that the female has often been described as a distinct species, and is generally known as the RED WRASSE. There are several other British species of this and closely allied genera, as the COREKWING (*Crenilabrus melops*, or *tinea*), about six inches long, and of a greenish blue colour, varied with yellow. The colours quickly fade after the fish is taken out of the water.

WREATH, WREATHED, in Heraldry. A wreath is a twisted garland of silk of different colours, otherwise called a torce, on which it has, since the 14th c., been usual to place the crest. The side-view of a wreath thus drawn exhibits six divisions, which are generally tintured with the livery colours—that is, the principal metal and colour of the shield. Every crest is now understood to be placed upon a wreath, except when it is expressly stated to issue out of a chapeau or coronet. A wreath, when represented alone, shews its circular form. A Moor's head is sometimes encircled with a

Wreath.

heraldic wreath. A wreath is always understood to be the twisted garland of silk above explained, unless otherwise specified; but wreaths of laurel, oak, ivy, &c. sometimes occur, and savages used as supporters are often wreathed about the head and middle with laurel. Ordinaries are occasionally wreathed, otherwise called *tortills*, in which case they are represented as if composed of two colours, twisted as in the heraldic wreath; as in the coat of Carmichael, argent, a fess wreathed azure and gules.

WREDE, KARL PHILIPP, PRINCE OF, a Bavarian field-marshal, was born at Heidelberg, 29th April 1767. Belonging to a noble family, he early obtained official employment, and in 1792 was assessor to the high court of Heidelberg; in 1793, was elected 'civil commissary' in the Palatinate, and in this latter capacity accompanied for five years the armies of Wurmsier, Duke Albert, and the Archduke Charles, in Italy and Germany; and frequently took a direct share in military operations. In 1799, his military career may be said to have commenced by his leading a body of Bavarian volunteers to join the Archduke Charles, and for his distinguished conduct in that campaign he obtained, 15th May 1800, the grade of major-general. After the peace of 1800, he devoted much time and labour to the organisation of the Bavarian army; and when war was renewed, found himself at the head of the Bavarian contingent, well disciplined and thoroughly equipped, fighting side by side with his former foes the French, and took a prominent part in most of the campaigns against the Austrians, Prussians, and Russians till 1813. But, after the retreat from Russia, offended at some real or fancied insults which had been offered to him, he returned to Munich, joined the anti-French party, which was headed by the queen and crown-prince; and though his intrigues were put a stop to by the victories of Lützen and Bautzen, he soon after succeeded in bringing about the treaty of 8th October 1813, by which Bavaria joined the coalition against France, and before the end of the same month, was at the head of 70,000 men. Attacked by Napoleon with an inferior force, he was, after a bloody and protracted contest, defeated at Hanau. He was chosen soon after to command the fourth corps of Schwarzenberg's army, and though unsuccessful in most of his petty conflicts, contributed consider-

ably to the successful advance on Paris. His services were rewarded by the dignities of field-marshal (7th March) and prince (9th June 1814), and by the gift of the domain of Ellingen. On the brief renewal of the contest during the 'Hundred Days,' W. was preparing to invade Lorraine, when the battle of Waterloo put an end to the strife. After this period, W. was employed on many important missions, and was charged with the pacification of Rhenish Bavaria during the revolution of 1830. He died at Ellingen, 12th December 1838.

WREN, SIR CHRISTOPHER, a renowned English architect, was born at East Knoyle, in Wiltshire, on the 20th of October 1632. His father, Dr C. Wren, was Dean of Windsor, and his uncle, Dr M. Wren, was Bishop successively of Hereford, Norwich, and Ely. At an early age, young W. was placed at Westminster School, under the celebrated Dr Busby, and while yet only in his fourteenth year, was entered a gentleman-commoner of Wadham College, Oxford. Here he made considerable progress in mathematical studies, and attracted the notice of the cultivators of physical science—whether resident at the university or visitors—by his inventions of certain mathematical instruments, and his general zeal and enthusiasm in the pursuit of experimental philosophy. In 1650, he took his degree of B.A., and in 1653, that of M.A., having been previously made Fellow of All Souls. He now also became a member of a society established at Oxford for the improvement of natural and experimental philosophy; and in 1654, is spoken of by Evelyn, in his *Diary*, as 'that miracle of a youth;' also, in his *Sculptura*, as 'that rare and early prodigy of universal science.' The acquaintance thus begun, ripened into a firm friendship between W. and Evelyn.

In 1655, W. greatly assisted in perfecting the barometer, then only recently invented. In 1657, he left Oxford for London, where he became Gresham Professor of Astronomy. In May 1661, however, he returned to Oxford, as Savilian Professor of Astronomy. The same year, he received the degree of D.C.L. Before leaving London, W. had, in conjunction with Lord Brouncker, the Hon. Robert Boyle, Mr Bruce, Dr Wilkins, Sir Robert Moray, and others, who used to meet together at Gresham College, laid the foundation of the future Royal Society. Before the Society was formally incorporated, the members felt much the absence of W. from their meetings, and one of their first proceedings was to get the king to lay his commands upon him to perfect a design he had in hand of a globe of the moon, and to 'proceed in drawing the shapes of little animals as they appear in the microscope.' The lunar globe was finished, much to the satisfaction of his Majesty, who placed it in his cabinet of rarities. He also summoned W. from Oxford to assist Sir John Denham with his advice on architectural subjects; the poet Denham having been appointed Surveyor-general of his Majesty's buildings, but possessing little or no knowledge of the subject.

The study of architecture was one to which W. had given great attention, while still a very young man, notwithstanding his devotion to mathematics, astronomy, chemistry, and even anatomy. In 1663, in his capacity of Assistant Surveyor-general, he was offered a large salary to go to Tangier, to survey and direct the works at the mole, harbour, and fortifications; but this commission he declined. In the same year, W. was engaged by the Dean and Chapter of St Paul's to make a survey of the cathedral, with a view to certain projected repairs in that vast fabric. He accordingly drew up a very careful and elaborate account of the state of the building, with suggestions for its improvement, and

accompanying drawings and designs. All of these were laid before the king; but before any further steps were taken for the restoration of St Paul's, that building was levelled to the ground by the memorable fire of 1666, and W. was destined to be the architect of the new cathedral, instead of the restorer of the old. The first work actually built from a design by W. was the chapel at Pembroke College, Cambridge, in 1663. But in the same year he designed the Sheldonian Theatre at Oxford, which was commenced in 1664, and finished in 1669. In 1664, W. also designed some valuable additions to the buildings at Trinity College, Cambridge; particularly the beautiful western quadrangle known as Nevile's Court. To this he added, in 1666, the Library of Trinity College, said by Gwilt to be 'one of his finest productions, and one with which he himself was well satisfied. It consists of two orders; a Doric arcade below, open to a basement supported by columns, which has a flat ceiling. . . . The principal story is decorated with three quarter columns of the Ionic order, well proportioned.'

In 1665, W. visited Paris, where he made the acquaintance of Bernini, architect of the Louvre, and of other distinguished men. In the following year, he returned, to find the Royal Society earnestly engaged in searching out the causes of the great plague, so soon to be succeeded by the great fire which laid London in ashes. This disaster at once opened a wide field for the exertion of W.'s genius. He formed a plan, and drew designs for the entire rebuilding of the metropolis, embracing wide streets, magnificent quays along the banks of the river, and other well-considered improvements. In rebuilding London, however, few of W.'s recommendations were adopted. He was certainly chosen to be the architect of new St Paul's, one of the finest non-Gothic cathedrals in the world; besides which, he designed more than fifty other churches in place of those destroyed by the fire. The great church of St Paul, built on the model of St Peter's at Rome, was begun in 1675, and completed in 1710, when the last stone was laid upon the lantern by the architect's son, Christopher. Besides the numerous churches mentioned, W. built the Royal Exchange, London, in 1667; Custom-house, London, in 1668; Temple Bar in 1670; the Monument in 1671—1677; the College of Physicians in 1674—1698; the Royal Observatory, Greenwich, in 1675; the Gateway Tower, Christchurch, Oxford, in 1681—1682; Chelsea Hospital, 1682—1690; Ashmolean Museum, Oxford, 1683; Hampton Court, 1690; Morden College, Blackheath, 1692; Greenwich Hospital, 1696; Buckingham House, 1703; Marlborough House, 1709; the towers at the west front of Westminster Abbey in 1713; besides the unfinished palace of Winchester, in 1683.

In 1672, W. received the honour of knighthood. In 1674, he married Faith, daughter of Sir John Coghill, by whom he had a son, Christopher, who survived him; and his wife dying, he married, in 1679, Jane, daughter of Viscount Fitzwilliam, by whom he had issue, a son and daughter. In 1680, W. was elected President of the Royal Society. In 1684, he was made comptroller of the works at Windsor Castle; and in 1685, he was elected Grand Master of the order of Freemasons. He was also elected a member of the House of Commons for New Windsor in 1689, and being unseated on petition, was immediately re-elected for the same place. In 1698, he was appointed Surveyor-general of the Works and Repairs at the Abbey of St Peter, Westminster; and in the same year, was again elected Grand Master of the Freemasons. W. died in his chair after dinner, on the 25th of February 1723, aged 90 years, and was buried in St Paul's

Cathedral, where the appropriate inscription of 'Si monumentum requiris, circumspice,' marks his tomb. During his declining years, he was treated with neglect, and even injustice, by the court of England; 'one Benson' was appointed by George I. to supersede him in the office of Surveyor-general; and some private individuals carpied at his works in a most malevolent spirit. Steele, however, vindicated the fame of his friend in the *Tatler*, in which W. is introduced in the character of Nestor; and few have been found since that time hardy enough to call in question the well-merited reputation of Sir C. W. as a distinguished architect, mathematician, and scientific observer.

WREN (*Troglodytes*), a genus of birds of the Creeper family (*Centhidae*), having a slender, slightly curved, and pointed bill, the edge of the mandibles entire; the wings very short and rounded; the tail short, and carried erect; the legs slender, and rather long. Their plumage is generally dull. They are natives chiefly of the northern hemisphere, and most of them are American. They live on or

Wren and Nest (*Troglodytes vulgaris*).

near the ground, seeking for insects and worms amongst low bushes, and in other similar situations. The COMMON or EUROPEAN W. (*T. vulgaris*) is found in all parts of Europe, and in the north of Asia. It is more abundant in the northern than in the central and southern parts of Europe, and is found even in the arctic regions. It is a very small bird, only about four inches long, reddish-brown above, with narrow transverse streaks of dark brown, yellowish white below, the greater wing-coverts with three or four small bead-like spots of white. From its peculiarity of form, and its active, lively habits, it is one of the most familiarly known of British birds. It frequents gardens, hedges, and thickets. Its flight is not long sustained; it merely flits from bush to bush, or from one stone to another, with very rapid motion of the wings. It sometimes ascends trees, nearly in the manner of creepers. The male has a loud sweet song. The nest is large for the size of the bird, oval, domed above, with an opening on the side, and is composed of hay or moss, lined with feathers, and generally of materials such that it resembles in colour the objects beside it, and is not easily discovered. It is often placed under the thatch of a building, under the turf of a turf-topped wall, against the side of a moss-covered tree, or under an impending bank, always so as to be sheltered from rain. The eggs are usually from seven to ten in number, and the male is assiduous in his attentions to the female in supplying her with food during incubation, and afterwards assists her in the care of the young. Two broods are

produced in the season. In severe winter weather, a number of wrens often take shelter together in an old nest, or in a hole of a wall; sometimes they roost in byres, to enjoy the warmth proceeding from the cattle. When driven from bushes, the W. is easily run down; and the hunting of wrens on St Stephen's Day is an old custom in the south of Ireland. In general, however, the W. is almost as much a popular favourite in Britain as the Red-breast. The name *Kitty Wren* is popularly given to it in many parts of the country.—The North American species of W. are numerous; some of them, however, have recently been placed in new genera.—The HOUSE W. (*T. œdon*) is larger than the European W., being about five inches long. It is reddish-brown above, barred with dusky, and pale fulvous white below, with a light brownish tinge across the breast. It is abundant in the eastern parts of the United States. It is less shy than the European W., and often builds its nest near houses, and in boxes prepared for it. The nests are made to fill the boxes; and to effect this, a large mass of heterogeneous materials is sometimes collected. The song of the House W. is very sweet. The male is a very bold, pugnacious bird, readily attacking birds far larger than itself, as the blue-bird and swallows, and taking possession of the boxes which they have appropriated for their nests. It even attacks cats when they approach its nest.—The WINTER W. (*T. hyemalis*) is so similar to the European W., that it is not easy to state a specific difference. It is common throughout North America, from Labrador to Louisiana, and partially migratory. Several other species are common in North America, as the CAROLINA W. (*Troglodytes* or *Thryophilus Ludovicianus*) and the MARSH W. (*Troglodytes* or *Cistophilus palustris*), both of which are found chiefly in the vicinity of water. All of them agree very nearly in their habits with the Common Wren.

WREXHAM, a municipal and parliamentary borough in Denbighshire, and one of the most important towns in North Wales, 11 miles south-south-west of Chester, on an affluent of the Dee. The town is handsome and lively, and the church, a handsome edifice, in Perpendicular, was built about the year 1470, though its tower, 135 feet in height, was not completed till 1500. This church contains a monument and two medallions by Roubilliac. In the vicinity are several collieries, which, together with lead-mines, iron-works, paper-mills, and breweries, give employment to the inhabitants. It is also of very considerable importance on account of its markets and fairs, one of which, in March, lasts for fourteen days, and is attended by traders of all descriptions, and from great distances. W. unites with Denbigh, Holt, and Ruthen in sending a member to parliament. It is a station on the Great Western Railway. Pop. (1861) 7562.

WRIGHT, THOMAS, an English antiquary and historian, was born near Ludlow, in 1810, and was educated in the grammar-school of that town. From school, he proceeded to Trinity College, Cambridge, where he took his degree of B.A. in 1834, and subsequently that of M.A. At an early age, W. shewed considerable literary talent, and while still at the university, contributed to *Fraser's Magazine*, the *Gentleman's Magazine*, the *Literary Gazette*, and other periodicals. In 1836, he came to London, and at once commenced the career of a man of letters; and from that time to the present, he has been continually before the public in the capacity of author, editor, or translator. In 1837, he was elected a Fellow of the Society of

Antiquaries; and in the following year, published his first considerable work, entitled *Queen Elizabeth and her Times* (2 vols. 8vo). In this year also, he was one of the two founders of the Camden Society, for which he edited various works at different times, such as the *Latin Poems of Walter Mapes*, *Letters on the Dissolution of the Monasteries*, &c. He was also for some years Honorary Secretary of the Camden Society. In 1843, W., in conjunction with his friend, Mr Roach Smith, founded the British Archaeological Association. He also took an active part in the formation of the Percy and Shakspeare Societies, and for each of these, from time to time, edited volumes. Upon the death of the Earl of Munster in 1842, W. was elected to succeed him as Corresponding Member of the Institute of France, an honour never before attained by one so young. There were several candidates; but W. was chosen by a large majority, among whom were two ministers of state, MM. Guizot and Villemain. W. is also a member of the Society of Antiquaries of France, of the Ethnological Society of Paris, of the Royal Society of Northern Antiquaries of Copenhagen, and of other learned societies on the continent and in America.

Of W.'s various works—said to exceed 100 volumes in number, including, of course, translations and works edited for Societies—the following may be regarded as the principal: *Biographia Britannica Literaria*, 2 vols., of which the Anglo-Saxon period appeared in 1842, and the Anglo-Norman in 1846; *Essays on Subjects connected with the Literature, Popular Superstitions, and History of England in the Middle Ages* (2 vols. 1846); *The Archaeological Album, or Museum of National Antiquities—the Illustrations by F. W. Fairholt* (1845); *England under the House of Hanover, Illustrated from the Caricatures of the Day* (2 vols. 1848); *Narratives of Sorcery and Magic* (2 vols. 1851); *History of Ludlow* (1852); *The Celt, the Roman, and the Saxon: a History of the Early Inhabitants of Britain down to the Conversion of the Anglo-Saxons to Christianity* (1852; 2d ed. 1861); *History of Ireland* (3 vols. 1854); *Wanderings of an Antiquary* (1854); *Cambridge University Transactions* (2 vols. 1854); *Dictionary of Obsolete and Provincial English* (2 vols. 1857); *History of France* (3 vols. 1856—1862); *Guide to the Ruins of the Roman City of Uriconium, at Wroxeter, near Shrewsbury* (1859); *Political Poems and Songs relating to English History composed during the Period from the Accession of Edward III. to that of Richard III.* (2 vols. 1859—1861). These volumes form part of the series of works published, under the direction of the Master of the Rolls, in illustration of the medieval history of England; *Les Cent Nouvelles Nouvelles* (2 vols. 1858), being a collection of medieval tales from the only known manuscript of the same, discovered by W. in the library of the Hunterian Museum, Glasgow; *Essays on Archaeological Subjects* (2 vols. 1861); *History of Domestic Manners and Sentiments in England during the Middle Ages, with Illustrations by F. W. Fairholt* (1861); *A History of Caricature and Grotesque in Literature and Art, with Illustrations by F. W. Fairholt* (1865). To these may be added his edition of the *Life of King Alfred*, translated from the German of Dr R. Pauli (1852); and the *History of Julius Cæsar*, by the Emperor Napoleon III., translated from the French by W. in 1865.

WRIGHTIA, a genus of plants of the natural order *Apocynaceæ*, containing some of the greatest twining shrubs of the East Indies, such as, attaching themselves in the first instance to trees for support, become themselves at last of tree-like thickness, as well as height, and kill the supporting trees by their

choking embrace. The corolla is salver-shaped, with scales in its throat: the fruit consists of two erect follicles. The leaves are simple, generally ovate, or nearly so. The timber of some species, as

Wrightia tinctoria.

W. mollissima and *W. coccinea*, is valuable. *W. antidysenterica*, a native of Ceylon, yields CONESSI BARK, a valuable astringent and febrifuge; *W. tinctoria*, common in many parts of India, yields excellent indigo, and was strongly recommended for cultivation on this account by Dr Roxburgh, the produce being large, and the plant less dependent on rain than the species of *Indigofera*.

WRIT is a general term much used in the law to denote a formal document proceeding in the Queen's name, or the name of a judge or other officer of the law. Such is a writ of summons commencing an action at law. In nearly all actions and proceedings, writs of various kinds are issued, which are named from the nature of the particular act to be done.

WRITER, a term rather vaguely applied in Scotland to a law practitioner, or the clerk to a law practitioner; and in provincial towns, designating more definitely one of those law agents who act both as practitioners before the sheriff, and generally as factors in the management of private affairs, like the writers to the Signet and solicitors in supreme courts in Edinburgh. In Aberdeen, this class of law-agents adopt the name of Advocates, in virtue of an old usage, which has latterly had the authority of a charter.

WRITER TO THE SIGNET, or CLERK TO THE SIGNET, the name given to an important body of legal practitioners in Edinburgh, corresponding generally to the highest class of attorneys in London. They are said to derive this designation from having been originally clerks in the office of the Secretary of State, where the different writs that passed under the king's signet were prepared. Act 1537, c. 39, establishing the College of Justice, mentions the Clerks to the Signet as a previously existing body; and though no charter of incorporation is extant, the society is considered entitled to all the privileges of a corporation. The Keeper of the Signet, an officer appointed by the crown, appoints one of the members of the Society of Writers to the Signet his deputy, who is in use to preside at meetings of the Society, and, along with certain other members named by him as commissioners, to manage its affairs.

Admission to the Society must be preceded (1) by attendance during two different sessions, or two full

years courses of lectures on the faculty of Arts of a Scottish university, one of the certificates of attendance being from a Professor of Humanity; (2) by an apprenticeship of five years' duration, which must not be entered on under 16 years of age; (3) by attendance on four courses of law in the university. Previous to admission, the candidate has also to undergo two examinations, one in scholarship, and one in law. The whole expenses of admission to the Society, including the apprentice-fee of £200, is £410, 15s. 6d.
